3gpp-imsi

IN THIS SECTION

- Syntax | 1578
- Hierarchy Level | 1579
- Description | 1579
- Required Privilege Level | 1579
- Release Information | 1579

Syntax

```
3gpp-imsi {
    equals value;
    has-prefix value;
    has-suffix value;
    matches value;
}
```

Hierarchy Level

```
[edit unified-edge gateways tdf gateway-name domain-selection term term-name from]
```

Description

Specify the RADIUS AVP 3GPP-IMSI for the incoming RADIUS request from the subscriber.

After this criterion and the other match criteria specified for the TDF domain or PCEF profile selection term are matched, the specified TDF domain or PCEF profile is selected.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

unified-edge—To view this statement in the configuration.

unified-edge-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.1.

RELATED DOCUMENTATION

802.3ad (EX and QFX Series)

IN THIS SECTION

Syntax | 1580

- Hierarchy Level (EX Series) | 1580
- Hierarchy Level (NFX, OCX, and QFX Series) | 1581
- Description | 1581
- Options | 1581
- Required Privilege Level | 1581
- Release Information | 1581

Syntax

Syntax (EX Series)

```
802.3ad {
    aex;
    (backup | primary);
    lacp {
        force-up;
        port-priority
    }
}
```

Syntax (NFX, OCX, and QFX Series)

```
802.3ad ae{x;
    lacp {
        force-up;
        (primary | backup);
    }
    port-priority;
}
```

Hierarchy Level (EX Series)

```
[edit interfaces interface-name ether-options]
```

Hierarchy Level (NFX, OCX, and QFX Series)

```
[edit interfaces interface-name ether-options]
```

Description

Specify the aggregated Ethernet logical interface number.

NOTE:

- The "port-priority" on page 12856 statement is not supported on QFabric systems.
- The "force-up" on page 7376 statement is not supported on QFX10002 switches.

Options

- ae*x*—Name of the LAG. Aggregated Ethernet logical interface number.
- backup—Designate the interface as the backup interface for link-protection mode.
- primary—Designate the interface as the primary interface for link-protection mode.

The remaining statements are described separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.0.

IN THIS SECTION

- Syntax | **1582**
- Hierarchy Level | **1583**
- Description | **1583**
- Options | **1583**
- Required Privilege Level | **1583**
- Release Information | **1584**

Syntax

```
802.3ad {
    primary | backup;
    ae interface-number ;
    lacp {
        port-priority priority-number;
    }
    link-index index-number
```

```
    distribution-list distribution-list-number
}
```

Hierarchy Level

```
[edit interfaces interface-name fastether-options],
[edit interfaces interface-name gigether-options]
```

Description

Specify aggregated Ethernet logical interface number.

Options

bundle Join an aggregated Ethernet interface.

ae *interface-number* Aggregated Ethernet logical interface number. For MX Series routers running Junos release 14.2R3 and later you can configure a maximum of 1000 aggregated interfaces. On MX2010 and MX2020 routers you can configure a maximum of 800 aggregated interfaces.

primary | backup For link protection configurations, specify the link as primary link or backup link for egress traffic.

lacp Configure Link Aggregation Control Protocol. Specify the port priority in the range 0 through 65535. Default port-priority is 127.

link-index Specify the desired child link index within the aggregated Ethernet Interface. Index number of the logical interface reflects its initialization sequence.

distribution-list For targeted distribution, specify the distribution list to which the interface belongs.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

`primary` and `backup` options added in Junos OS Release 8.3.

aaa

IN THIS SECTION

- Syntax | 1605
- Hierarchy Level | 1605
- Description | 1605
- Options | 1606
- Required Privilege Level | 1606
- Release Information | 1606

Syntax

```
aaa {
    access-profile access-profile {
        config-payload-password config-payload-password;
    }
    client {
        password;
        username;
    }
    use-routing-instance-address;
    no-push-to-identity-management;
}
```

Hierarchy Level

```
[edit security ike gateway gateway-name]
```

Description

Specify that extended authentication is performed in addition to IKE Phase 1 authentication for remote users trying to access a VPN tunnel. This authentication can be through Extended Authentication (XAuth) or Extensible Authentication Protocol (EAP). Include a previously created access profile,

configured with the `edit access profile` statement, to specify the access profile to be used for authentication information.

Options

access-profile *profile-name*	Name of the previously created access profile to use for extended authentication for remote users trying to access a VPN.
config-payload-password	Specify common client password for IKEv2 configuration payload with 1 to 128 characters.
client	Specify an AAA client uernamе and password for each configured authenticator that is allowed to request authentications for supplicants. • `password`—AAA client password with 1 to 128 characters. • `username`—AAA client username with 1 to 128 characters.
no-push-to-identity-management	(Optional) Specify the option to prevent pushing of the connection states to the identity management server.
use-routing-instance-address	Specify an AAA address from pool configured in routing-instance of type virtual-router.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1X49-D80.

`config-payload-password` option added in Junos OS Release 20.1R1.

`no-push-to-identity-management` option added in Junos OS Release 24.4R1.

IPsec Overview

aaa-access-profile (L2TP LNS)

IN THIS SECTION

- Syntax | 1607
- Hierarchy Level | 1607
- Description | 1607
- Options | 1607
- Required Privilege Level | 1608
- Release Information | 1608

Syntax

```
aaa-access-profile profile-name;
```

Hierarchy Level

```
[edit services l2tp tunnel-group name],
[edit access profile profile-name client client-name l2tp]
```

Description

Specify a AAA access profile that overrides the AAA access profile configured for the routing instance with the `access-profile` statement. You can configure a profile to specify the RADIUS server settings for a tunnel group or for a LAC client, or both. The AAA access profile configured for the client takes precedence over the AAA access profile configured for the tunnel group, which takes precedence over the access profile configured for the routing instance.

Options

profile-name Name of the local access profile for the tunnel group or client.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.4.

Support at the `[edit access profile profile-name client client-name l2tp]` hierarchy level introduced in Junos OS Release 12.1.

aaa clients (TDF)

IN THIS SECTION

- Syntax | 1608
- Hierarchy Level | 1609
- Description | 1609
- Options | 1609
- Required Privilege Level | 1609
- Release Information | 1609

Syntax

```
aaa {
    clients client-name;
```

```
    apply-groups [group-names];
    apply-groups-except [group-names];
}
```

Hierarchy Level

```
[edit unified-edge gateways tdf gateway-name]
```

Description

Specify the GGSN, PGW, or BNG RADIUS clients that can send RADIUS requests to a TDF gateway.

Options

client-name RADIUS client name that was previously configured at the `[edit access radius clients]` hierarchy level.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

unified-edge—To view this statement in the configuration.

unified-edge-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.1.

aaa-context (AAA Options)

IN THIS SECTION

- Syntax | 1610
- Hierarchy Level | 1610
- Description | 1610
- Options | 1610
- Required Privilege Level | 1611
- Release Information | 1611

Syntax

```
aaa-context aaa-context-name;
```

Hierarchy Level

```
[edit access aaa-options aaa-options-name]
```

Description

Specify the logical-system:routing-instance (LS:RI) that the subscriber session uses for AAA (RADIUS) interactions like authenticating and accounting. For example, this may correspond to the LS:RI for a retail ISP that provides services to the subscriber.

NOTE: Only the default logical system is supported.

Options

aaa-context-name	Name of the logical-system:routing-instance.

Required Privilege Level

access—To view this statement in the configuration.

access-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.2.

- Hierarchy Level | 1612
- Description | 1612
- Default | 1612
- Options | 1612
- Required Privilege Level | 1612
- Release Information | 1613

Syntax

```
aaa-logical-system logical-system-name {
     aaa-routing-instance routing-instance-name;
}
```

Hierarchy Level

```
[edit access domain map domain-map-name]
```

Description

Configure a non-default logical system in which the `authd` daemon sends AAA requests for the domain map.

> **NOTE**: Subscriber management is supported in the default logical system only. The `aaa-logical-system` statement is for future extensions of subscriber management and is not supported in current Junos OS releases.

Default

Default logical system for the subscriber.

Options

logical-system-name—Name of the logical system.

The remaining statement is explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.4.

aaa-options (PPP Profile)

IN THIS SECTION

- Syntax | **1615**
- Hierarchy Level | **1615**

- Description | 1615
- Options | 1616
- Required Privilege Level | 1616
- Release Information | 1616

Syntax

```
aaa-options aaa-options-name;
```

Hierarchy Level

```
[edit access group-profile profile-name ppp ppp-options],
[edit dynamic-profiles profile-name interfaces pp0 unit "$junos-interface-unit" ppp-options]
```

Description

Specify a set of AAA options that is used for authentication of PPP subscribers. The set of options is defined globally with the `aaa-options` *`aaa-options-name`* statement at the `[edit access]` hierarchy level.

You can specify the option set in a dynamic PPP profile or in a group profile.

- In a dynamic PPP profile—In this case, usernames are examined and modified for dynamic PPP subscribers logging in by means of the subscriber and AAA contexts that are specified in the AAA options set. The option set must include the `access-profile` *`profile-name`* statement to specify the name of a subscriber access profile.

- In a group profile—In this case, usernames are examined and modified for tunneled PPP subscribers on the LNS logging in by means of the subscriber and AAA contexts that are specified in the AAA options set.

> **NOTE**: When PPP options are configured in both a group profile and a dynamic profile, the dynamic profile configuration takes complete precedence over the group profile when the dynamic profile includes one or more of the PPP options that can be configured in the group profile. Complete precedence means that there is no merging of

options between the profiles. The group profile is applied to the subscriber only when the dynamic profile does not include any PPP option available in the group profile.

This meant that `aaa-options` configured in a group profile is not applied when the dynamic profile includes any PPP-option, even when the dynamic profile does not include `aaa-options`.

Options

aaa-options-name	Name of the set of options.

Required Privilege Level

access—To view this statement in the configuration.

access-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.2.

aaa-policy-control (PCEF Profile)

IN THIS SECTION

- Syntax | **1617**
- Hierarchy Level | **1617**

- Description | 1617
- Required Privilege Level | 1617
- Release Information | 1617

Syntax

```
aaa-policy-control {
    aaa-profile aaa-profile-name;
    pcc-rulebases [rulebase-name];
    user-password password;
}
```

Hierarchy Level

```
[edit unified-edge pcef profiles profile-name]
```

Description

Configure RADIUS-server-controlled policy management for a policy and charging enforcement function (PCEF) profile.

The remaining statements are explained separately.

Required Privilege Level

unified-edge—To view this statement in the configuration.

unified-edge-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.1.

RELATED DOCUMENTATION

Configuring a Policy and Charging Enforcement Function Profile for Junos OS Subscriber Aware Policies That a RADIUS Server Controls

aaa-profile (PCEF Profile)

IN THIS SECTION

- Syntax | 1618
- Hierarchy Level | 1618
- Description | 1618
- Options | 1619
- Required Privilege Level | 1619
- Release Information | 1619

Syntax

```
aaa-profile aaa-profile-name;
```

Hierarchy Level

```
[edit unified-edge pcef profiles profile-name aaa-policy-control]
```

Description

Specify the AAA profile that identifies the RADIUS server policy control parameters for the policy and charging enforcement function (PCEF) profile. The AAA profile must already be defined at the `[edit unified-edge aaa]` hierarchy level.

Options

aaa-profile-name	Name of the AAA profile.

Required Privilege Level

unified-edge—To view this statement in the configuration.

unified-edge-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.1.

aaa-routing-instance (Domain Map)

IN THIS SECTION

- Syntax | 1620
- Hierarchy Level | 1620
- Description | 1620
- Default | 1620
- Options | 1620
- Required Privilege Level | 1620
- Release Information | 1620

Syntax

```
aaa-routing-instance (routing-instance-name | default);
```

Hierarchy Level

```
[edit access domain map domain-map-name],
[edit access domain map domain-map-name aaa-logical-system logical-system-name]
```

Description

Configure the routing instance in which the `authd` daemon sends AAA requests for the domain map.

> **NOTE**: Subscriber management is supported in the default logical system only. The `aaa-logical-system` statement, which appears in the CLI, is not supported in current Junos OS releases.

Default

Routing instance used for the subscriber context.

Options

routing-instance-name—Name of the routing instance.

`default`—The default routing instance.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.4.

`default` option added in Junos OS Release 13.3.

Configuring Statistics Profiles

aacl-statistics-profile

IN THIS SECTION

- Syntax | 1623
- Hierarchy Level | 1623
- Description | 1624
- Options | 1624
- Required Privilege Level | 1624
- Release Information | 1624

Syntax

```
aacl-statistics-profile profile-name {
    aacl-fields {
        field-name;
    }
    file filename;
    record-mode  (interim-active-only | interim-full);
    report-interval minutes;
}
```

Hierarchy Level

```
[edit services service-set service-set-name],
[edit system services local-policy-decision-function statistics]
```

Description

Create an AACL statistics profile, which configures the files to which statistics records are exported and the format that is exported.

Options

`file` *`filename`*—Name of the file to receive the statistics data output. Enclose the name within quotation marks. All files are placed in the directory **/var/stats/aacl**.

`profile-name`—Identifier for the profile.

`record-mode`—Record mode for the reporting interval; possible values are `interim-active-only`, which reports only statistics that have changed, or `interim-full`, which reports all available statistics.

`report-interval` *`minutes`*—Frequency at which statistics are recorded, in minutes.

- **Default:** 15 minutes
- **Range:** 5 through 1440 minutes

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

abstract-hop

IN THIS SECTION

- Syntax | 1625
- Hierarchy Level | 1625
- Description | 1625
- Options | 1626
- Required Privilege Level | 1626
- Release Information | 1626

Syntax

```
abstract-hop abstract-hop-name {
    constituent-list constituent-list-name (include-any-list | include-all-list | exclude-all-
list | exclude-any-list);
    operators (AND | OR);
}
```

Hierarchy Level

```
[edit logical-systems logical-systems-name protocols mpls],
[edit protocols mpls]
```

Description

Define router clusters or groups, similar to the sequence of real-hop constraints (strict or loose), as a sequence of abstract hops for setting up a label-switched path (LSP).

An abstract hop is a logical combination of the existing traffic engineering constraints, such as administrative groups, extended administrative groups, and Shared Risk Link Groups (SRLGs), along with the ordering property of real hops. As a result, when a sequence of abstract hops is used in a path constraint, ordering is achieved among the groups of routers that meet a logical combination of link or

node attributes called constituent attributes. A path can use a combination of real and abstract hops as constraints.

Options

abstract-hop-name	Name of the abstract hop that is a logical combination of the existing traffic engineering constraints, such as administrative groups, extended administrative groups, and SRLGs, along with the ordering property of real hops.
constituent-list *constituent-list-name*	Name of the predefined constituent list to be included in defining the abstract hop. A constituent list enables you to define a set of constituent attributes that is identified with a user-defined name.
include-any-list	Satisfy any one of the attributes specified in the constituent list.
include-all-list	Satisfy all of the attributes specified in the constituent list.
exclude-all-list	Satisfy none of the attributes specified in the constituent list.
exclude-any-list	Fail to satisfy any one of the attributes specified in the constituent list.
operators	Specify the operation between constituent lists when more than one constituent list is included in the abstract hop definition.

AND Satisfy all the constituent lists referenced in the abstract hop definition for the attached node to be a member of the abstract hop.

OR Satisy at least one of the constituent lists referenced in the abstract hop definition for the attached node to be a member of the abstract hop.

Required Privilege Level

accept (Router Advertisement Guard Policy)

IN THIS SECTION

- Syntax | 1627
- Hierarchy Level | 1628
- Description | 1628
- Required Privilege Level | 1628
- Release Information | 1628

Syntax

```
accept {
    match-list {
        match-criteria {
            (match-all | match-any);
        }
        prefix-list-name prefix-list-name;
        source-ip-address-list address-list-name;
        source-mac-address-list address-list-name;
    }
    match-option {
        hop-limit {
            (maximum | minimum) value;
        }
        managed-config-flag;
        other-config-flag;
        router-preference (high | low | medium);
```

```
    }
}
```

Hierarchy Level

```
[edit forwarding-options access-security router-advertisement-guard policy policy-name]
```

Description

Configure the accept policy for an IPv6 Router Advertisement (RA) guard policy. RA guard protects against rogue RA messages generated either maliciously or unintentionally by unauthorized or improperly configured routers connecting to the network segment. An RA guard policy is used to validate incoming RA messages on the basis of whether they match the conditions defined in the policy.

When RA guard is enabled, the switch compares the information contained in the attributes of RA messages to the information contained in the policy. If RA guard is enabled by using an accept policy, any RA messages that match the conditions defined in the policy are forwarded, and RA messages that do not match the conditions are dropped.

The criteria are configured either as one or more lists of source address or address prefixes, which are associated with the accept policy by using the `match-list` statement, or match condition parameters, which are associated with the accept policy by using the `match-option` statement.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.

accept (Dynamic Profile)

IN THIS SECTION

- Syntax | 1629
- Hierarchy Level | 1629
- Description | 1629
- Options | 1629
- Required Privilege Level | 1630
- Release Information | 1630

Syntax

```
accept (any | dhcp-v4 | dhcp-v6 | inet | inet6 | pppoe);
```

Hierarchy Level

```
[edit interfaces interface-name auto-configure stacked-vlan-ranges dynamic-profile profile-name],
[edit interfaces interface-name auto-configure vlan-ranges dynamic-profile profile-name]
```

Description

Specify the type of VLAN Ethernet packet accepted by an interface that is associated with a VLAN dynamic profile or stacked VLAN dynamic profile.

Options

`any`—Any packet type. Specifies that any incoming packets trigger the dynamic creation of a VLAN with properties determined by the auto-configure interface configuration stanza and associated profile attributes. This option is used when configuring wholesaling in a Layer 2 network.

`dhcp-v4`—IPv4 DHCP packet type. Specifies that incoming IPv4 DHCP discover packets trigger the dynamic creation of a VLAN with properties determined by the auto-configure interface configuration stanza and associated profile attributes

> **NOTE**: The DHCP-specific `mac-address` and `option-82` options are rejected if the `accept` statement is not set to `dhcp-v4`.

`dhcp-v6`—IPv6 DHCP packet type. Specifies that incoming IPv6 DHCP discover packets trigger the dynamic creation of a VLAN with properties determined by the auto-configure interface configuration stanza and associated profile attributes.

`inet`—IPv4 Ethernet and ARP packet type.

`inet6`—IPv6 Ethernet packet type.

`pppoe`—Point-to-Point Protocol over Ethernet packet type.

> **NOTE**: The `pppoe` VLAN Ethernet packet type option is supported only for MPC/MIC interfaces.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.5.

`dhcp-v4` option added in Junos OS Release 10.0.

`dhcp-v6`, `inet6` and `pppoe` options added in Junos OS Release 10.2.

`any` option added in Junos OS Release 10.4.

[edit logical-systems logical-system-name  interfaces interface-name unit logical-unit-number family inet6 address address vrrp-inet6-group group-id]
```

Description

In a Virtual Router Redundancy Protocol (VRRP) configuration, determine whether or not a router that is acting as the primary router accepts all packets destined for the virtual IP address.

- `accept-data`—Enable the primary router to accept all packets destined for the virtual IP address.
- `no-accept-data`—Prevent the primary router from accepting packets other than the ARP packets destined for the virtual IP address.

Default

If the router acting as the primary router is the IP address owner or has its priority set to 255, the primary router, by default, responds to all packets sent to the virtual IP address. However, if the router acting as the primary router does not own the IP address or has its priority set to a value less than 255, the primary router responds only to ARP requests.

NOTE:

- If you want to restrict the incoming IP packets to ICMP packets only, you must configure firewall filters to accept only ICMP packets.
- If you include the `accept-data` statement, your routing platform configuration does not comply with RFC 3768 (see section 6.4.3 of RFC 3768, *Virtual Router Redundancy Protocol (VRRP)*.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Configuring an Interface to Accept All Packets Destined for the Virtual IP Address of a VRRP Group

accept-join-always-from

IN THIS SECTION

Syntax | 1633
Hierarchy Level | 1633

- Description | 1633
- Required Privilege Level | 1634
- Release Information | 1634

Syntax

```
accept-join-always-from [policy-name ... ];
```

Hierarchy Level

```
[edit protocols interface name],
[edit routing-instances name protocols pim interface name]
```

Description

Configure an interface to accept PIM join or prune messages based on a specified policy.

A device might not accept PIM joins if the upstream neighbor address in the join packet is not that device's address. This option enables the device to accept and to install PIM (S,G) join states that the device would not normally accept.

Configure one or more routing policies that specify the upstream neighbor addresses for which the interface should always accept PIM joins. Then you can configure this statement with those policy options. Use the `prefix-list` and `policy-statement` options at the `[edit policy-options]` hierarchy to configure a routing policy.

For example, the following configuration creates a policy named `ajaf-101` that always accepts join messages from upstream neighbors in a prefix list named `rtr-101`:

```
set routing-instances RI protocols pim interface irb.101 accept-join-always-from ajaf-101
set policy-options prefix-list rtr-101 192.168.101.1/32
```

```
set policy-options policy-statement ajaf-101 term term1 from prefix-list rtr-101
set policy-options policy-statement ajaf-101 term term1 then accept
set policy-options policy-statement ajaf-101 then reject
```

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

accept-remote-source

IN THIS SECTION

- Syntax | 1642
- Hierarchy Level | 1642
- Description | 1642
- Required Privilege Level | 1643
- Release Information | 1644

Syntax

```
accept-remote-source;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols pim interface interface-name],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols pim
interface interface-name],
[edit protocols pim interface interface-name],
[edit routing-instances routing-instance-name protocols pim interface interface-name]
```

Description

You can configure an incoming interface to accept multicast traffic from a remote source. A remote source is a source that is not on the same subnet as the incoming interface. Figure 1 on page 1643 shows just such a topology – R2 connects to the R1 source on one subnet, and to the incoming interface on R3 on another subnet (ge-1/3/0.0 in the figure).

Figure 1: Accepting Multicast Traffic from a Remote Source

In this topology R2 is a pass-through device not running PIM, so R3 is the first hop router for multicast packets sent from R1. Because R1 and R3 are in different subnets, the default behavior of R3 is to disregard R1 as a remote source. You can have R3 accept multicast traffic from R1, however, by enabling `accept-remote-source` on the target interface.

```
[edit protocols pim interface ge-1/3/0.0]
user@host# set accept-remote-source
```

NOTE: If the interface you identified is not the only path from the remote source, be sure it is the best path. For example you can configure a static route on the receiver side PE router to the source, or you can prepend the AS path on the other possible routes. That said, do not use `accept-remote-source` to receive multicast traffic over multiple upstream interfaces, as this use case for the command is not supported.

```
[edit policy-options policy-statement as-path-prepend term prepend]
user@host# set from route-filter 192.168.0.0/16 orlonger
user@host# set from route-filter 172.16.0.0/16 orlonger
user@host# set then as-path-prepend "1 1 1 1"
```

Commit the configuration changes, and then to confirm that the interface you configured is accepting traffic from the remote source, run the following command:

```
user@host# show pim statistics
```

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

- Release Information | 1646

Syntax

```
accept-source-mac {
    mac-address mac-address;
}
```

Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number]
```

Description

For Gigabit Ethernet (GE), Fast Ethernet (FE), or 10 Gigabit Ethernet (XE) interfaces, specify the MAC addresses from which the interface can receive packets. Ensure that you update the MAC address if the remote Ethernet card is replaced. Replacing the interface card changes the MAC address. If you do not update the MAC address, the interface cannot receive packets from the new card.

NOTE:

- Software-based MAC limiting is supported on SRX300, SRX320, and SRX340 devices. A maximum of 32 MAC addresses is supported per device.

Options

mac-address —MAC address filter. You can specify the MAC address as six hexadecimal bytes in one of the following formats: *nn:nn:nn:nn:nn:nn* (for example, `00:11:22:33:44:55`) or *nnnn:nnnn:nnnn* (for example, `0011.2233.4455`). You can configure up to 32 source addresses. To specify more than one address, include multiple *mac-addresses* in the `source-address-filter` statement.

Required Privilege Level

interface—To view this statement in the configuration..

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.4.

accept-source-mac

IN THIS SECTION

- Syntax | 1647
- Hierarchy Level | 1647
- Description | 1648
- Required Privilege Level | 1648
- Release Information | 1648

Syntax

```
accept-source-mac {
    mac-address mac-address {
        policer {
            input cos-policer-name;
            output cos-policer-name;
        }
    }
}
```

Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]
```

Description

For Gigabit Ethernet intelligent queuing (IQ) interfaces only or for Gigabit Ethernet and aggregated Ethernet interfaces on switches, accept traffic from and to the specified remote media access control (MAC) address.

The `accept-source-mac` statement is equivalent to the `source-address-filter` statement, which is valid for Fast Ethernet, and Gigabit Ethernet interfaces only. To allow the interface to receive packets from specific MAC addresses, include the `accept-source-mac` statement.

On untagged Gigabit Ethernet interfaces, you should not configure the `source-address-filter` statement and the `accept-source-mac` statement simultaneously. On tagged Gigabit Ethernet interfaces, you should not configure the `source-address-filter` statement and the `accept-source-mac` statement with an identical MAC address specified in both filters.

The remaining statements are explained separately. See CLI Explorer.

NOTE: The `policer` statement is not supported on PTX Series Packet Transport Routers.

NOTE: If you configure MAC filtering on the AE interface, you must configure the interface with `family ethernet-switching`.

NOTE: On QFX platforms, if you configure source MAC addresses for an interface using the "static-mac" on page 28549 or "persistent-learning" on page 12451 statements and later configure a different MAC address for the same interface using the `accept-source-mac` statement, the MAC addresses that you previously configured for the interface remain in the ethernet-switching table and can still be used to send packets to the interface.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

```

Description

Configure the BGP ingress node to accept SRv6 service when you enable BGP services over the SRv6 data plane. Egress provider edge (PE) devices that support SRv6-based Layer 3 services advertise overlay service prefixes along with a service SID. BGP ingress nodes receive the advertisements from the egress provider edge (PE) device and then add the prefix to the corresponding VRF RIB also known as routing information base.

Required Privilege Level

routing

Release Information

Statement introduced in Junos OS Release 20.4R1.

```

Description

Configure a limit to the number of prefixes that can be accepted in a BGP peer session. When that limit is exceeded, a system log message is sent.

This statement provides the ability to log a message, reset the BGP session, or do both when the number of prefixes received from the peer and accepted by policy exceeds a preset limit. This functionality is identical to the `prefix-limit` functionality except that it operates against accepted prefixes rather than received prefixes.

Options

maximum *number*

When you set the maximum number of prefixes, a message is logged when that number is exceeded.

- **Range:** 1 through 4,294,967,295 ($2^{32} - 1$)

teardown <*percentage*>

(Optional) If you include the `teardown` statement, the session is torn down when the maximum number of prefixes is reached. If you specify a percentage, messages are logged when the number of prefixes exceeds that percentage. After the session is torn down, it is reestablished in a short time unless you include the `idle-timeout` statement. Then the session can be kept down for a specified amount of time, or forever. If you specify `forever`, the session is reestablished only after you issue a `clear bgp neighbor` command.

If the `teardown` statement is not configured, a message is logged when the number of prefixes exceeds the value configured for the `maximum` option.

- **Range:** 1 through 100

`idle-timeout (forever | timeout-in-minutes)`

(Optional) If you include the `idle-timeout` statement, the session is torn down for a specified amount of time, or forever. If you specify a period of time, the session is allowed to reestablish after this timeout period. If you specify `forever`, the session is reestablished only after you intervene with a `clear bgp neighbor` command.

- **Range:** 1 through 2400

`drop-excess <percentage>`

(Optional) If you include the `drop-excess <percentage>` option, the excess routes are dropped when the maximum number of prefixes is reached. If you specify a percentage, the routes are logged when the number of prefixes exceeds that percentage value of the maximum number.

`hide-excess <percentage>`

(Optional) If you include the `hide-excess <percentage>` option, the excess routes are hidden when the maximum number of prefixes is reached. If you specify a percentage, the routes are logged when the number of prefixes exceeds that percentage value of the maximum number. If the percentage is modified, the routes are re-evaluated automatically. If the active routes drop below the specified percentage, those routes are kept as hidden.

To recover the routes from the hidden state, run the following commands to refresh the routes and get a complete re-evaluation of the routes:

`clear bgp table <table-name>` and `clear bgp neighbor <neighbor address> soft-inbound`

> **NOTE**: You can include either the `teardown <percentage>`, `drop-excess <percentage>`, or `hide-excess <percentage>` statement option one at a time.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.2.

`drop-excess <percentage>` and `hide-excess <percentage>` options are introduced in Junos OS Release 21.2.

`drop-excess` <*percentage*> and `hide-excess` <*percentage*> options are introduced in Junos OS Evolved Release 21.3R1.

[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number
pppoe-options],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number
pppoe-underlying-options]
```

Description

Configure an alternative access concentrator name in the AC-NAME tag in a PPPoE control packet for use with a dynamic PPPoE subscriber interface. If you do not configure the access concentrator name, the AC-NAME tag contains the system name.

NOTE: The `[edit ... family pppoe]` hierarchies are supported only on MX Series routers with MPCs.

Options

name—Name of the access concentrator.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Support at the `[edit interfaces interface-name unit logical-unit-number pppoe-underlying-options]` and `[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number pppoe-underlying-options]` hierarchy levels introduced in Junos OS Release 10.1.

Support at the `[edit ... family pppoe]` hierarchies introduced in Junos OS Release 11.2.

access-domain (Remote Device Management)

IN THIS SECTION

- Syntax | 1657
- Hierarchy Level | 1657
- Description | 1657
- Options | 1658
- Required Privilege Level | 1659
- Release Information | 1659

Syntax

```
access-domain {
    vlan-id-list [vlan-id-low-vlan-id-high vlan-id]
}
```

Hierarchy Level

```
[edit routing-instances routing-instance-name system services remote-device-management service-device device-name],
[edit system services remote-device-management service-device device-name]
```

Description

Specify the Layer 2 domain that is served by the service device. The access domain represents the set of subscriber-facing Layer 2 locations that map to the device. You define the domain when you map subscribers to the device by configuring one or more non-overlapping outer VLAN ID ranges or discrete VLAN IDs that are served by the remote device. All BNG subscriber sessions with outer VLAN tags

matching this list are connected to this remote device in the access network. During subscriber negotiation and provisioning, the BNG provisions remote services sourced by the policy server (PCRF) on this remote device.

You can configure the VLAN IDs as discrete values, even if they are consecutive; however, it is more practical to configure ranges of IDs with additional discrete VLAN IDs as needed. You can configure any number of ranges or discrete IDs; no limit is enforced.

The list of VLAN IDs can overlap across remote devices to support redundancy in the access network.

NOTE: To specify more than one range or address in the list, place the values inside square brackets, separated by spaces. For example:

```
[100 102 110 120-130]
```

NOTE: You do not have to specify an access domain (list of VLAN IDs) when you configure a service device. This means that a service device without the access domain can be connected and dynamically assigned an IP address. Then at some later point when the device needs to support subscriber connections, you can configure one or more VLAN IDs or ranges with the `vlan-id-list` statement.

NOTE: You can add new VLAN Ids or ranges to the access domain at any time, even when the device has active subscriber services mapped to it. You cannot delete IDs or ranges when at least one active subscriber service is configured for that discrete VLAN ID or any VLAN ID in the range being deleted.

You can use the "request services remote-device-management reconfigure service-device" on page 14961 command to reconfigure a remote device to provision all active subscriber services matching the access domain.

Options

vlan-id-low	(Optional) Lowest VLAN ID in the range,
vlan-id-high	(Optional) Highest VLAN ID in the range.
vlan-id	(Optional) Discrete VLAN ID that is not part of a range.

Required Privilege Level

system—To view this statement in the configuration.

Release Information

Statement introduced in Junos OS Release 18.3R1.

access (Dynamic Access Routes)

IN THIS SECTION

- Syntax | 1659
- Hierarchy Level | 1660
- Description | 1660
- Required Privilege Level | 1660
- Release Information | 1660

Syntax

```
access {
    route prefix {
        next-hop next-hop;
        metric route-cost;
        preference route-distance;
        tag route-tag;
        tag2 route-tag2;
    }
```

Hierarchy Level

```
[edit dynamic-profiles profile-name routing-instances  $junos-routing-instance routing-options],
[edit dynamic-profiles profile-name routing-instances  $junos-routing-instance routing-options
rib routing-table-name],
[edit dynamic-profiles  profile-name routing-options]
```

Description

Dynamically configure access routes in a dynamic client profile.

> **NOTE**: Starting in Junos OS Release 15.1, we recommend that you use only access routes for framed route support. We recommend that you do not use access-internal routes. If you configure the `access-internal` statement in the dynamic profile, it is ignored. The subscriber's address is stored in the session database entry before the dynamic profile installs the framed route, enabling the next-hop address to be resolved when it is not explicitly specified in the Framed-Route RADIUS attribute [22] or Framed-IPv6-Route attribute [99].

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.5.

Support at the `[edit dynamic-profiles profile-name routing-instances $junos-routing-instance routing-options]` and `[edit dynamic-profiles profile-name routing-instances $junos-routing-instance routing-options rib routing-table-name]` hierarchy levels introduced in Junos OS Release 10.1.

Change History Table

Feature support is determined by the platform and release you are using. Use Feature Explorer to determine if a feature is supported on your platform.

Release	Description
15.1	Starting in Junos OS Release 15.1, we recommend that you use only access routes for framed route support.

access-identifier

IN THIS SECTION

- Syntax | 1661
- Hierarchy Level | 1661
- Description | 1662
- Options | 1662
- Required Privilege Level | 1662
- Release Information | 1662

Syntax

```
access-identifier identifier-string;
```

Hierarchy Level

```
[edit protocols ancp interfaces interface-name],
[edit protocols ancp interfaces interface-set]
```

Description

Associate an access-loop circuit identifier (ACI) with the VLAN or set of VLANs that carry traffic to the subscriber using that access loop; identify a particular subscriber. This statement requires that the name of the interface or interface set is statically configured or deterministic. This means that it can be used with dynamic or static interface sets, VLAN-tagged interface sets, or static VLAN/VLAN demux interfaces.

Options

identifier-string—Unique identifier string for the access loop circuit; also configured on the access node.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.4.

access-internal (Dynamic Access-Internal Routes)

IN THIS SECTION

- Syntax | 1666
- Hierarchy Level | 1666
- Description | 1666
- Required Privilege Level | 1667
- Release Information | 1667

Syntax

```
access-internal {
    route subscriber-ip-address {
        qualified-next-hop underlying-interface {
            mac-address address;
        }
    }
```

Hierarchy Level

```
[edit dynamic-profiles profile-name routing-instances  $junos-routing-instance routing-options],
[edit dynamic-profiles profile-name routing-instances  $junos-routing-instance routing-options
rib routing-table-name],
[edit dynamic-profiles routing-options]
```

Description

(Releases earlier than Junos OS Release 15.1) Dynamically configure access-internal routes in a dynamic client profile. Access-internal routes are optional, but are used instead of access routes if the next-hop address is not specified in the Framed-Route Attribute [22] for IPv4 or the Framed-IPv6-Route attribute [99] for IPv6.

> **NOTE**: Starting in Junos OS Release 15.1, we recommend that you use only access routes for framed route support. We recommend that you do not use access-internal routes. If you configure the `access-internal` statement in the dynamic profile, it is ignored. The subscriber's address is stored in the session database entry before the dynamic profile installs the framed route, enabling the next-hop address to be resolved when it is not explicitly specified in the Framed-Route RADIUS attribute (22) or Framed-IPv6-Route attribute [99].

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.5.

Support at the `[edit dynamic-profiles` *`profile-name`* `routing-instances $junos-routing-instance routing-options]` and `[edit dynamic-profiles` *`profile-name`* `routing-instances $junos-routing-instance routing-options rib` *`routing-table-name`*`]` hierarchy levels introduced in Junos OS Release 10.1.

Change History Table

Feature support is determined by the platform and release you are using. Use Feature Explorer to determine if a feature is supported on your platform.

Release	Description
15.1	Starting in Junos OS Release 15.1, we recommend that you use only access routes for framed route support.

options],
[edit logical-systems logical-system-name routing-options],
[edit routing-instances routing-instance-name routing-options],
[edit routing-options]
```

Description

Configure parameters for internal access routes.

The remaining statements are explained separately.

NOTE: Starting in Junos OS Release 15.1R4, the router no longer supports a configuration where a static route points to a next hop that is tied to a subscriber. Typically, this might occur when RADIUS assigns the next hop with the Framed-IP-Address attribute. An alternative to this misconfiguration is to have the RADIUS server provide a Framed-Route attribute that matches the static route.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.1.

```

Description

Configure values to adjust data rates by a percentage of the actual data rate, or adjust encapsulation overhead by adding to or subtracting from the total cell or frame bytes a specified number of bytes. Depending on the value, it may be reported to AAA, CoS, or both.

The actual (unadjusted) downstream and upstream data rates, line type, and encapsulation mode are received from the access node by the ANCP agent in ANCP port messages, or by the PPPoE daemon from the PPPoE intermediate agent (PPPoE-IA) in PADI or PADR messages. The ANCP agent or PPPoE daemon subsequently adjusts rates and bytes based on the configuration.

Adjustments are applied to all subscribers using access lines of the specific subscriber access line type:

- Adjusted and unadjusted downstream and upstream rates are always reported to AAA in response to an AAA request.
- Adjusted and unadjusted downstream rates and overhead byte adjustments are reported to CoS, but only when you include the `qos-adjust` statement at the `[edit protocols ancp]` hierarchy level.
- Overhead byte adjustments are not reported to AAA.

AAA reports the adjusted values to the RADIUS server in the Access-Request and Accounting-Request messages through Juniper Networks VSAs 26-141, Downstream-Calculated-Qos-Rate Rate, and 26-142, Upstream-Calculated-Qos-Rate.

The ANCP agent reports these values to the LAC in an L2TP network. The LAC passes the rates to the LNS in the following messages and AVPs:

- AVP 24, Tx Connect Speed (ICCN message)
- AVP 38, Rx Connect Speed (ICCN message)
- AVP 97, Connect Speed Update (CSUN message)

NOTE: Starting in Junos OS Release 19.3R1, the pre-existing adjustment options were renamed and placed in the new `dsl` stanza. The old DSL options are deprecated, but they redirect to the new location. The `hierarchical-access-network-detection` option is unchanged.

BEST PRACTICE: We recommend that you update your scripts to use the "dsl" on page 6025 statement when you upgrade to Junos OS Release 19.3R1 or higher releases. The redirect function will be supported for only a limited time.

Options

adsl-overhead-bytes *bytes*

Number of bytes added to or subtracted from the actual downstream cell overhead for all subscribers on an ADSL access line to account for the traffic encapsulation overhead. The adjusted value is reported to CoS when you include the `qos-adjust` statement at the `[edit protocols ancp]` hierarchy level.

NOTE: This option replaces the `adsl-bytes` statement at the `[edit protocols ancp qos-adjust]` hierarchy level.

- **Range:** -100 through 100 bytes
- **Default:** 0 bytes

adsl-total-adjust *percentage*

Adjustment factor applied globally to the downstream and upstream data rates for all subscribers on an ADSL access line. The adjusted rate is reported only to AAA.

> **NOTE**: This option replaces the `qos-adjust-adsl` statement at the `[edit protocols ancp]` hierarchy level.

- **Range:** 0 through 100 percent
- **Default:** 100 percent

adsl2-overhead-bytes *bytes*

Number of bytes added to or subtracted from the actual downstream cell overhead for all subscribers on an ADSL2 access line to account for the traffic encapsulation overhead. The adjusted value is reported to CoS when you include the `qos-adjust` statement at the `[edit protocols ancp]` hierarchy level.

> **NOTE**: This option replaces the `adsl2-bytes` statement at the `[edit protocols ancp qos-adjust]` hierarchy level.

- **Range:** -100 through 100 bytes
- **Default:** 0 bytes

adsl2-total-adjust *percentage*

Adjustment factor applied globally to the downstream and upstream data rates for all subscribers on an ADSL2 access line. The adjusted rate is reported only to AAA.

> **NOTE**: This option replaces the `qos-adjust-adsl2` statement at the `[edit protocols ancp]` hierarchy level.

- **Range:** 0 through 100 percent
- **Default:** 100 percent

adsl2-plus-overhead-bytes *bytes*

Number of bytes added to or subtracted from the actual downstream cell overhead for all subscribers on an ADSL2+ access line to account for the traffic encapsulation overhead. The adjusted value is reported to CoS when you include the `qos-adjust` statement at the `[edit protocols ancp]` hierarchy level.

> **NOTE**: This option replaces the `adsl2-plus-bytes` statement at the `[edit protocols ancp qos-adjust]` hierarchy level.

- **Range:** -100 through 100 bytes
- **Default:** 0 bytes

adsl2-plus-total-adjust *percentage*

Adjustment factor applied globally to the downstream and upstream data rates for all subscribers on an ADSL2+ access line. The adjusted rate is reported only to AAA.

> **NOTE**: This option replaces the `qos-adjust-adsl2-plus` statement at the `[edit protocols ancp]` hierarchy level.

- **Range:** 0 through 100 percent
- **Default:** 100 percent

gfast-bonded-overhead-adjust *percentage*

Adjustment factor in percent that is applied to the downstream and upstream bonded data overhead rates for all subscribers on a G.fast high speed bonded DSL line connected to a PON tree infrastructure.

- **Range:** 80 through 100 percent
- **Default:** 100 percent

gfast-bonded-overhead-bytes *bytes*

Number of bytes added to or subtracted from the actual downstream cell bonded overhead for all subscribers on a G.fast high speed bonded DSL line connected to a PON tree infrastructure. Specify G.fast bonded value in bytes.

- **Range:** -100 through 100 bytes
- **Default:** 0 bytes

gfast-bonded-total-adjust *percentage*

Adjustment factor in percent that is globally applied to the downstream and upstream bonded data rates for all subscribers on a G.fast high speed bonded DSL line connected to a PON tree infrastructure.

- **Range:** 0 through 100 percent
- **Default:** 100 percent

gfast-overhead-adjust *percentage*

Adjustment factor in percent that is applied to the downstream and upstream data overhead rates for all subscribers on a G.fast high speed DSL line connected to a PON tree infrastructure.

- **Range:** 80 through 100 percent
- **Default:** 100 percent

gfast-overhead-bytes *bytes*

Number of bytes added to or subtracted from the actual downstream cell overhead for all subscribers on a G.fast high speed DSL line connected to a PON tree infrastructure.

- **Range:** -100 through 100 bytes
- **Default:** 0 bytes

gfast-total-adjust *percentage*

Adjustment factor in percent that is globally applied to the downstream and upstream data rates for all subscribers on a G.fast high speed bonded DSL line connected to a PON tree infrastructure.

- **Range:** 0 through 100 percent
- **Default:** 100 percent

hierarchical-access-network-detection

Enable parsing of ANCP subscriber access loop attributes (TLVs) for backhaul line identifiers, to recognize when the access node references a logical interface set rather than an individual subscriber. If the Access-Aggregation-Circuit-ID-ASCII attribute (TLV 0x03) string begins with a # sign, then the remainder of the string represents a logical intermediate node (DPU-C or PON tree) in the access network to which the subscriber is attached. The string is used as the name of a CoS Level 2 interface set that groups subscribers.

> **NOTE**: The Access-Loop-Remote-ID (TLV (0x02) is similarly parsed for the # character, but the resulting string is not used in the current release.

These TLVs can be parsed in ANCP messages or PPPoE IA tags in PADR messages.

- **Default:** Disabled, in case some users include an initial # character for some other purpose.

other-overhead-adjust *percentage*

Adjust the actual downstream rate for an access line of DSL type OTHER by multiplying the rate by the specified percentage. The adjusted rate is reported to CoS when you include the `qos-adjust` statement at the `[edit protocols ancp]` hierarchy level.

The router reports some access technology types as DSL type OTHER. For example, when an OLT sends PON rates in DSL TLVs, the DSL type is set to OTHER.

> **NOTE**: This option replaces the `other-overhead-adjust` statement at the `[edit protocols ancp qos-adjust]` hierarchy level.

- **Range:** 80 through 100 percent
- **Default:** 100 percent

other-overhead-bytes *bytes*

Number of bytes added to or subtracted from the actual downstream frame overhead for all subscribers on an access line of DSL type OTHER to account for the traffic encapsulation overhead. The adjusted value is reported to CoS when you include the `qos-adjust` statement at the `[edit protocols ancp]` hierarchy level.

The router reports some access technology types as DSL type OTHER. For example, when an OLT sends PON rates in DSL TLVs, the DSL type is set to OTHER.

> **NOTE**: This option replaces the `other-bytes` statement at the `[edit protocols ancp qos-adjust]` hierarchy level.

- **Range:** -100 through 100 bytes
- **Default:** 0 bytes

other-total-adjust *percentage*

Adjustment factor applied globally to the downstream and upstream data rates for all subscribers on an access line of DSL type OTHER. The adjusted rate is reported only to AAA.

The router reports some access technology types as DSL type OTHER. For example, when an OLT sends PON rates in DSL TLVs, the DSL type is set to OTHER.

> **NOTE**: This option replaces the `qos-adjust-other` statement at the `[edit protocols ancp]` hierarchy level.

- **Range:** 0 through 100 percent
- **Default:** 100 percent

sdsl-bonded-overhead-adjust *percentage*

Adjust the actual downstream rate for an SDSL bonded access line by multiplying the rate by the specified percentage.

- **Range:** 80 through 100 percent
- **Default:** 100 percent

sdsl-bonded-overhead-bytes *bytes*

Number of bytes added to or subtracted from the actual downstream frame overhead for all subscribers on an SDSL bonded access line to account for the traffic encapsulation overhead.

- **Range:** -100 through 100 bytes
- **Default:** 0 bytes

sdsl-bonded-total-adjust *percentage*

Adjustment factor applied globally to the downstream and upstream data rates for all subscribers on an SDSL bonded access line. This value is reported to AAA.

- **Range:** 0 through 100 percent
- **Default:** 100 percent

sdsl-overhead-adjust *percentage*

Adjust the actual downstream rate for an SDSL access line by multiplying the rate by the specified percentage. The adjusted rate is reported to CoS when you include the `qos-adjust` statement at the `[edit protocols ancp]` hierarchy level.

> **NOTE**: This option replaces the `sdsl-overhead-adjust` statement at the `[edit protocols ancp qos-adjust]` hierarchy level.

- **Range:** 80 through 100 percent
- **Default:** 100 percent

sdsl-overhead-bytes *bytes*

Number of bytes added to or subtracted from the actual downstream frame overhead for all subscribers on an SDSL access line to account for the traffic encapsulation overhead. The adjusted value is reported to CoS when you include the `qos-adjust` statement at the `[edit protocols ancp]` hierarchy level.

> **NOTE**: This option replaces the `sdsl-bytes` statement at the `[edit protocols ancp qos-adjust]` hierarchy level.

- **Range:** -100 through 100 bytes
- **Default:** 0 bytes

sdsl-total-adjust *percentage*

Adjustment factor applied globally to the downstream and upstream data rates for all subscribers on an SDSL access line. The adjusted rate is reported only to AAA.

> **NOTE**: This option replaces the `qos-adjust-sdsl` statement at the `[edit protocols ancp]` hierarchy level.

- **Range:** 0 through 100 percent

- **Default:** 100 percent

vdsl-overhead-adjust *percentage*

Adjust the actual downstream rate for a VDSL access line by multiplying the rate by the specified percentage. The adjusted rate is reported to CoS when you include the `qos-adjust` statement at the `[edit protocols ancp]` hierarchy level.

> **NOTE**: This option replaces the `vdsl-overhead-adjust` statement at the `[edit protocols ancp qos-adjust]` hierarchy level.

- **Range:** 80 through 100 percent
- **Default:** 100 percent

vdsl-overhead-bytes *bytes*

Number of bytes added to or subtracted from the actual downstream frame overhead for all subscribers on a VDSL access line to account for the traffic encapsulation overhead. The adjusted value is reported to CoS when you include the `qos-adjust` statement at the `[edit protocols ancp]` hierarchy level.

> **NOTE**: This option replaces the `vdsl-bytes` statement at the `[edit protocols ancp qos-adjust]` hierarchy level.

- **Range:** -100 through 100 bytes
- **Default:** 0 bytes

vdsl-total-adjust *percentage*

Adjustment factor applied globally to the downstream and upstream data rates for all subscribers on a VDSL access line. The adjusted rate is reported only to AAA.

> **NOTE**: This option replaces the `qos-adjust-vdsl` statement at the `[edit protocols ancp]` hierarchy level.

- **Range:** 0 through 100 percent
- **Default:** 100 percent

vdsl2-annex-q-bonded-overhead-adjust *percentage*

Adjust the actual downstream rate for a VDSL2 annex q bonded access line by multiplying the rate by the specified percentage. The adjusted rate is reported to AAA.

- **Range:** 80 through 100 percent
- **Default:** 100 percent

vdsl2-annex-q-bonded-overhead-bytes *bytes*

Number of bytes added to or subtracted from the actual downstream frame overhead for all subscribers on a VDSL2 annex q bonded access line to account for the traffic encapsulation overhead.

- **Range:** -100 through 100 bytes
- **Default:** 0 bytes

vdsl2-annex-q-bonded-total-adjust *percentage*

Adjustment factor applied globally to the downstream and upstream data rates for all subscribers on a VDSL2 annex q bonded access line. The adjusted rate is reported to AAA.

- **Range:** 0 through 100 percent
- **Default:** 100 percent

vdsl2-annex-q-overhead-adjust *percentage*

Adjust the actual downstream rate for a VDSL2 annex q access line by multiplying the rate by the specified percentage. The adjusted rate is reported to AAA.

- **Range:** 80 through 100 percent
- **Default:** 100 percent

vdsl2-annex-q-overhead-bytes *bytes*

Number of bytes added to or subtracted from the actual downstream frame overhead for all subscribers on a VDSL2 annex q access line to account for the traffic encapsulation overhead.

- **Range:** -100 through 100 bytes
- **Default:** 0 bytes

vdsl2-annex-q-total-adjust *percentage*

Adjustment factor applied globally to the downstream and upstream data rates for all subscribers on a VDSL2 annex q access line. The adjusted rate is reported to AAA.

vdsl2-bonded-overhead-adjust *percentage*

Adjust the actual downstream rate for a VDSL2 bonded access line by multiplying the rate by the specified percentage. The adjusted rate is reported to AAA.

- **Range:** 80 through 100 percent
- **Default:** 100 percent

vdsl2-bonded-overhead-bytes*bytes*

Number of bytes added to or subtracted from the actual downstream frame overhead for all subscribers on a VDSL2 bonded access line to account for the traffic encapsulation overhead.

- **Range:** -100 through 100 bytes

- **Default:** 0 bytes

vdsl2-bonded-total-adjust *percentage*

Adjustment factor applied globally to the downstream and upstream data rates for all subscribers on a VDSL2 bonded access line. The adjusted rate is reported to AAA.

- **Range:** 0 through 100 percent
- **Default:** 100 percent

vdsl2-overhead-adjust *percentage*

Adjust the actual downstream rate for a VDSL2 access line by multiplying the rate by the specified percentage. The adjusted rate is reported to CoS when you include the `qos-adjust` statement at the `[edit protocols ancp]` hierarchy level.

> **NOTE**: This option replaces the `vdsl2-overhead-adjust` statement at the `[edit protocols ancp qos-adjust]` hierarchy level.

- **Range:** 80 through 100 percent
- **Default:** 100 percent

vdsl2-overhead-bytes *bytes*

Number of bytes added to or subtracted from the actual downstream frame overhead for all subscribers on a VDSL2 access line to account for the traffic encapsulation overhead. The adjusted value is reported to CoS when you include the `qos-adjust` statement at the `[edit protocols ancp]` hierarchy level.

Number of bytes added to or subtracted from the actual downstream frame overhead.

> **NOTE**: This option replaces the `vdsl2-bytes` statement at the `[edit protocols ancp qos-adjust]` hierarchy level.

- **Range:** -100 through 100 bytes
- **Default:** 0 bytes

vdsl2-total-adjust *percentage*

Adjustment factor applied globally to the downstream and upstream data rates for all subscribers on a VDSL2 access line. The adjusted rate is reported only to AAA.

> **NOTE**: This option replaces the `qos-adjust-vdsl2` statement at the `[edit protocols ancp]` hierarchy level.

- **Range:** 0 through 100 percent
- **Default:** 100 percent

Release Information

Statement introduced in Junos OS Release 17.4R1.

The following options added in Junos OS 18.2R1:

`gfast-bonded-overhead-adjust`	`vdsl2-annex-q-bonded-overhead-adjust`
`gfast-bonded-overhead-bytes`	`vdsl2-annex-q-bonded-overhead-bytes`
`gfast-bonded-total-adjust`	`vdsl2-annex-q-bonded-total-adjust`
`gfast-overhead-adjust`	`vdsl2-annex-q-overhead-adjust`
`gfast-overhead-bytes`	`vdsl2-annex-q-overhead-bytes`
`gfast-total-adjust`	`vdsl2-annex-q-total-adjust`
`sdsl-bonded-overhead-bytes`	`vdsl2-bonded-overhead-bytes`
`sdsl-bonded-overhead-adjust`	`vdsl2-bonded-total-adjust`
`sdsl-bonded-total-adjust`	`vdsl2-bonded-total-adjust`

`hierarchical-access-network-detection` option added in Junos OS 18.4R1.

`attributes`, `dsl`, and `pon` statements added in Junos OS Release 19.3R1.

access-line-information (L2TP)

IN THIS SECTION

- Syntax | 1684
- Hierarchy Level | 1684
- Description | 1685
- Options | 1685
- Required Privilege Level | 1685
- Release Information | 1685

Syntax

```
access-line-information <connection-speed-update>;
```

Hierarchy Level

```
[edit services l2tp],
[edit services l2tp destination ip-address]
```

Description

Configure a LAC to forward subscriber line identification and other DSL attributes in ICRQ messages to the LNS by means of L2TP AVPs for all tunnels to all LNSs or for only tunnels with the specified endpoint for a particular LNS. Optionally, configure the LAC to send initial line rates in ICCN messages and subsequent rate updates in CSUN messages.

Configure an LNS to process such line information for all tunnels from all LACs or for only tunnels with the specified endpoint for a particular LAC. Optionally, configure the LNS to process rate updates received in CSUN messages from the LAC.

Including this statement at the `[edit services l2tp destination ip-address]` hierarchy level is useful when you know that some endpoints in the network do not support this feature or have an incorrect implementation. Configuring at this level enables you to restrict the transmission or processing of this information to only LACs and LNSs, respectively, that you know support the feature.

This statement has no effect on existing subscribers; it applies only to new subscribers.

Options

connection-speed-update (Optional) On the LAC, include the Connect Speed Update Enable AVP (98) in ICCN messages from the LAC to alert the LNS that the LAC might send CSUN messages that report speed changes originating with the ANCP agent.

On the LNS, enable processing of CSUN updates. If this option is not configured on the LNS, CSUN updates cannot be processed even when the Connect Speed Update Enable AVP (98) is received from the LAC. In that case, only rates received in AVP 24 (Tx speed) and AVP 38 (Rx speed) in ICCN messages can be applied.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.1.

Support at the `[edit services l2tp]` hierarchy level introduced in Junos OS Release 14.2.

Support for the LNS introduced in Junos OS Release 17.4R1 on MX Series routers.

access-profile (Dynamic Stacked VLAN)

IN THIS SECTION

- Syntax | 1693
- Hierarchy Level | 1693
- Description | 1693
- Required Privilege Level | 1694
- Release Information | 1694

Syntax

```
access-profile svlan-access-profile-name;
```

Hierarchy Level

```
[edit interfaces interface-name auto-configure stacked-vlan-ranges dynamic-profile profile-name]
```

Description

Access profiles contain subscriber access authentication, authorization and accounting (AAA) configuration parameters. You can create an access profiles and then attach it at various configuration levels. When you attach an access profile to an interface configured for dynamic VLAN or stacked VLAN, all the VLANs and stacked VLANs use the same set of AAA parameters configured in that access profile. The different access profiles can have different authentication/authorization settings so you can, for example, have authentication on some VLAN and stacked VLAN ranges but no authentication on other ranges.

You can assign different access profiles to different dynamic profiles on the same interface. If you assign an access profile at the global level, but a different access profile is assigned at the interface level, the access profile at the interface level authenticates all dynamic VLANs and stacked VLANs on the interface. Access profiles can be assigned at various levels, but the most specific access profile takes precedence over any other profile assignments..

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Access profiles contain subscriber access authentication, authorization and accounting (AAA) configuration parameters. You can create an access profiles and then attach it at various configuration levels. When you attach an access profile to an interface configured for dynamic VLAN or stacked VLAN, all the VLANs and stacked VLANs use the same set of AAA parameters configured in that access profile. The different access profiles can have different authentication/authorization settings so you can, for example, have authentication on some VLAN or stacked VLAN ranges but no authentication on other ranges.

You can assign different access profiles to different dynamic profiles on the same interface. If you assign an access profile at the global level, but a different access profile is assigned at the interface level, the access profile at the interface level authenticates all dynamic VLANs and stacked VLANs on the interface. Access profiles can be assigned at various levels, but the most specific access profile takes precedence over any other profile assignments.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.2.

RELATED DOCUMENTATION

Configuring an Interface to Use the Dynamic Profile Configured to Create Single-Tag VLANs

access-profile (Extensible Subscriber Services Manager)

IN THIS SECTION

- Syntax | **1696**
- Hierarchy Level | **1696**

- Description | 1696
- Options | 1696
- Required Privilege Level | 1696
- Release Information | 1696

Syntax

```
access-profile access-profile-name;
```

Hierarchy Level

```
[edit system services extensible-subscriber-services]
```

Description

Define the access profile name for time accounting. In most cases, the information about the access profile on the RADIUS server is the same as the information about the access profile of a control session. This configuration is mandatory.

Options

access-profile-name	Name of the access profile.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1.

access-profile-name (Duplicate Accounting)

IN THIS SECTION

- Syntax | 1697
- Hierarchy Level | 1697
- Description | 1697
- Options | 1697
- Required Privilege Level | 1697
- Release Information | 1698

Syntax

```
access-profile-name [profile-name];
```

Hierarchy Level

```
[edit access profile profile-name accounting duplication-vrf]
```

Description

Specify up to five access profiles, all in the same nondefault VRF (LS:RI combination), each of which lists one or more RADIUS accounting servers to which duplication accounting information is sent.

Options

profile-name Name of an access profile that lists RADIUS accounting servers for duplicate reporting.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3R3 and supported in later 12.3Rx releases.

Statement supported in Junos OS Release 13.2 and later releases.

[edit routing-instances routing-instances-name system services static-subscribers group group-
name],
[edit system services static-subscribers],
[edit system services static-subscribers group group-name]
```

Description

Specify the access profile that triggers AAA services for all static subscribers on interfaces configured at the `[edit system services static-subscribers interface]` hierarchy level or for the static subscribers in a specific group. The group version of this statement overrides the global configuration.

Options

profile-name—Name of the static subscriber access profile.

Required Privilege Level

access—To view this statement in the configuration.

access-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.6.

accounting-order

IN THIS SECTION

- Syntax | 1721
- Hierarchy Level | 1721
- Description | 1721
- Options | 1722
- Required Privilege Level | 1722
- Release Information | 1722

Syntax

```
accounting-order (radius | [accounting-order-data-list]);
```

Hierarchy Level

```
[edit access profile profile-name]
```

Description

Specify the order in which accounting methods are used.

Options

`radius`—Use the RADIUS accounting method.

[*accounting-order-data-list*]—Set of data listing the accounting order to be used, enclosed in brackets. This can be any combination of accounting methods, up to and including a list of the entire accounting order.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.0.

accounting (System) | **1746**

accounting-order (Service Accounting)

IN THIS SECTION

- Syntax | **1723**
- Hierarchy Level | **1723**
- Description | **1723**
- Default | **1723**
- Options | **1723**
- Required Privilege Level | **1724**
- Release Information | **1724**

Syntax

```
accounting-order (activation-protocol | local | radius);
```

Hierarchy Level

```
[edit access profile profile-name service]
```

Description

Specify the method that is used for reporting subscriber service accounting.

When you specify the `activation-protocol` method, the service accounting statistics are reported differently depending on how the service is activated:

- When the service is activated by the RADIUS server, the statistics are reported to the RADIUS server.
- When the service is activated by JSRC, the statistics are reported to JSRC.
- When the service is activated by the CLI configuration or a command—for example, through DHCP—the statistics are reported as determined by the flat-file profile configured at the `[edit access profile profile-name local]` hierarchy level. In this case, statistics are not reported if no flat-file profile is configured.

Default

`activation-protocol`

Options

activation-protocol Send service accounting reports by means of the application that activates services, such as JSRC, RADIUS, or the CLI.

local Send service accounting information to a flat file stored locally on the router. This method requires you to also configure the name of a flat-file profile at the `[edit access profile profile-name local]` hierarchy level. This profile determines which statistics and which nonstatistical parameters are collected for the service.

> **NOTE**: When you configure the `local` option, both volume and time statistics are collected for the service accounting sessions. In this case, you must not configure the `volume-time` option at the `[edit access profile profile-name service accounting statistics]` hierarchy level, or an error is generated when you commit the configuration.

radius Send service accounting reports to the RADIUS server by means of the RADIUS protocol.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.4.

`local` option added in Junos OS Release 17.1.

accounting-port (RADIUS Server)

IN THIS SECTION

- Syntax | 1725
- Hierarchy Level | 1725
- Description | 1725
- Options | 1725

Required Privilege Level | 1725
Release Information | 1725

Syntax

```
accounting-port port-number;
```

Hierarchy Level

```
[edit access radius servers name]
```

Description

Specify the RADIUS server port number to which the MX Series router sends RADIUS accounting-start and accounting-stop requests. RADIUS accounting-start and accounting-stop requests are used when the RADIUS server is not able to initiate a change of authorization request without an accounting record.

Options

port-number Port number to which the RADIUS requests are sent.

Required Privilege Level

access—To view this statement in the configuration.

access-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.1.

accounting-stop-on-failure

IN THIS SECTION

- Syntax | 1744
- Hierarchy Level | 1745
- Description | 1745
- Required Privilege Level | 1745
- Release Information | 1745

Syntax

```
accounting-stop-on-failure;
```

Hierarchy Level

```
[edit access profile profile-name accounting]
```

Description

Configure RADIUS accounting to send an Acct-Stop message when a subscriber session has been successfully authenticated and authorized, but then fails before an Acct-Start message is sent. By default, an Acct-Stop message is sent only if an Acct-Start message has been exchanged with the accounting server.

Consider a situation where RADIUS address pools are used to assign IP/IPv6 addresses. After a subscriber session is successfully authenticated, the RADIUS server authorizes the session by assigning an IP address from the RADIUS address pool and conveying that address in the Framed-IP-Address attribute. If a negotiation failure occurs at this point, the session is terminated before activating. The Acct-Start message is never sent because it is initiated by session activation. By default, an Acct-Stop message cannot be sent because the Acct-Start is never sent. However, if the `acct-stop-on-failure` statement is configured, the negotiation failure causes the Acct-Stop message to be sent, which explicitly notifies the RADIUS server that the session is disconnected and that it can free the allocated IP address back to the pool.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.1.

acfc

IN THIS SECTION

- Syntax | 1749
- Hierarchy Level | 1749
- Description | 1749
- Required Privilege Level | 1749
- Release Information | 1749

Syntax

```
acfc;
```

Hierarchy Level

```
[edit interfaces interface-name ppp-options compression],
[edit interfaces interface-name unit logical-unit-number ppp-options compression],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number ppp-
options compression]
```

Description

For interfaces with PPP encapsulation, configure compression of the Data Link Layer address and control fields. The `acfc` option is not supported with `frame-relay-ppp` encapsulation.

On M320, M120, and T Series routers, address and control field compression (ACFC) is not supported for any ISO family protocols. Do not include the `acfc` statement at the `[edit interfaces interface-name ppp-options compression]` hierarchy level when you include the `family iso` statement at the `[edit interfaces interface-name unit logical-unit-number]` hierarchy level.

Required Privilege Level

Description

Depending on the severity level of an error, you can configure one or more actions for the router to perform. For example, if the severity level of an error is major, you can configure the system to raise an alarm and restart the FPC. You can use `offline-pfe` and `reset-pfe` options to map errors belonging to `pfe` category.

Options

alarm Raise an FPC alarm.

disable-pfe (PTX routers) Disable Packet Forwarding Engine interfaces on an FPC. (MX240, MX480, MX960, MX2020 PTX10008 routers). Disables the interface associated with the ASIC that raised the error. Disables all PFE interfaces, alarms and logs. On MX Series routers, an MPC can have multiple ASICs handled by a single PFE. Disabling the PFE in such cases, is not the optimal way to handle the error.

get-state The system starts collecting statistics counters and other data from the affected FPC. The data is written and saved to a file under **/var** on the routing engine.

offline Disables the alarms, logs, and shuts down the affected FPC, allowing traffic to be re-routed through interfaces on other FPC in the device.

reset The system takes the affected FPC offline and resets to online, enables the alarms and logs.

offline-pfe Disables the alarms, logs, and shuts down the affected PFE.

reset-pfe Powers-off the PFE, disables the alarms and logs, then, powers-on the PFE, enables the alarms and logs.

log Log occurrences to the system log file.

trap The system raises traps for the FPC errors.

Usage

The usage guidelines are as follows:

- The specified PFE is disabled automatically if `offline-pfe` or `reset-pfe` is configured. For details, see *Configuring FPC Error Levels and Actions*.

Required Privilege Level

interface To view this statement in the configuration.

interface-control To add this statement to the configuration.

Release Information

Statement introduced for PTX Series routers in Junos OS Release 13.3.

Statement introduced for MX240, MX480, MX960 routers in Junos OS Release 14.2.

action (APN GTP)

IN THIS SECTION

- Syntax | **1761**

- Hierarchy Level | 1761
- Description | 1761
- Options | 1761
- Required Privilege Level | 1762
- Release Information | 1762

Syntax

```
action {
    drop;
    pass;
    selection (ms|net|vrf);
}
```

Hierarchy Level

```
[edit security gtp profile profile-name apn pattern-string imsi-prefiximsi-prefix]
```

Description

Use the GPRS tunneling protocol (GTP) profile access point name (APN) action (pass |drop |selection) to filter packets that helps you to allow or deny access to specific access points.

From Junos OS Release 20.4R1 onwards, the `[edit security gprs gtp profile profile-name apn pattern-string imsi-prefix` hierarchy-level is replaced by `[edit security gtp profile profile-name apn pattern-string imsi-prefix`.

Options

- **drop**—Use drop to specify to deny GTP packets from all selection modes for the specified access points.
- **pass**—Use pass to specify to permit GTP packets from all selection modes for the access points.
- **selection**—Use selection to specify one of the following selection modes for the access points:

- **ms**—The access point name is provided by a mobile station, and the user-subscription is not verified.
- **net**—The access point name is provided by a network, and the user subscription is not verified.
- **vrf**— The access point name is provided by a network or an MS, and the user-subscription is verified.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

action-priority (Routing Instance)

IN THIS SECTION

- Syntax | 1766
- Hierarchy Level | 1767
- Description | 1767
- Options | 1767
- Required Privilege Level | 1767
- Release Information | 1768

Syntax

```
action-priority value;
```

Hierarchy Level

```
[edit routing-instances routing-instance-name protocols protocol-name interface interface-name]
```

Description

Configure the priority for an interface on which the MAC move is applied. When a MAC move is configured with a corresponding action, and that limit is exceeded, the action is applied to one of the interfaces associated with that MAC address having the highest action priority. If the action configured for the MAC move is `shutdown`, you can use the action priority to determine which interface is disabled. If an interface is trusted, assign a low action priority to decrease the likelihood that the interface shuts down if the configured action is `shutdown` or `vlan-member-shutdown`.

If no action priority is configured, or if the interfaces have the same action priority, then the action is applied to the interface to which the MAC address moved last.

Options

value Value assigned to an interface associated with a MAC address move. The value determines the priority with which an action is applied to the interface if the MAC address move limit is reached. The interface with the highest priority is the interface with the lowest value configured for `action-priority`.

A higher value means lower priority. For example, if a MAC address move occurs between two interfaces with the action priority value set to 5 and 6, the interface with value 5 as the action priority value is blocked.

If a VPLS instance has MAC move action enabled, set the `action-priority` to 8 for the router to detect an interface as a core interface by the VPLS customer edge loop prevention feature. By default, the loop prevention feature supports lsi and vt-type interfaces as core interfaces; however, you can use this special action-priority value to designate any interface as a core interface.

- **Default:** 4
- **Range:** 0 through 8

Required Privilege Level

system—To view this statement in the configuration.

system–control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2.

- Default | 1769
- Required Privilege Level | 1769
- Release Information | 1769

Syntax

```
action-priority value;
```

Hierarchy Level

```
[edit vlans vlan-name switch-options mac-move-limit interface interface-name]
```

Description

Configure a priority for an interface on which the MAC move limit action will be applied. When a MAC move limit is configured, and a MAC address moves to a new interface more times than is allowed by the

limit, the configured action will be applied to the interface associated with that MAC address having the highest priority. The interface with the highest priority is the interface with the lowest value configured for `action-priority`. The default value for `action-priority` on an interface is 4.

If no action priority is configured, or if the interfaces have the same action priority, then the action will be applied to the interface to which the MAC address moved last.

Default

The default value for `action-priority` on an interface is 4.

Required Privilege Level

system—To view this statement in the configuration.
system–control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.4 .

The `[edit security utm default-configuration]` hierarchy level is introduced in Junos OS Release 18.2R1.

action (Security Rulebase IPS)

IN THIS SECTION

- Syntax | 1785
- Hierarchy Level | 1785
- Description | 1785
- Options | 1785
- Required Privilege Level | 1786
- Release Information | 1786

Syntax

```
action {
    class-of-service {
        dscp-code-point number;
         forwarding-class forwarding-class;
    }
    (close-client | close-client-and-server | close-server |drop-connection | drop-packet |
ignore-connection | mark-diffserv value | no-action | recommended);
}
```

Hierarchy Level

```
[edit security idp idp-policy policy-name rulebase-ips rule rule-name then]
```

Description

Specify the actions you want IDP to take when the monitored traffic matches the attack objects specified in the rules.

Options

- `no-action`—No action is taken. Use this action when you want to only generate logs for some traffic.

- `ignore-connection`—Stops scanning traffic for the rest of the connection if an attack match is found. IDP disables the rulebase for the specific connection.
- `mark-diffserv` *value*—Assigns the indicated service-differentiation value to the packet in an attack, then passes them on normally.
- `class-of-service`—Associates a class-of-service forwarding class as an action to the IDP policy; also sets the value of the DSCP code point. You can use the default forwarding class names or define new ones. Forwarding-class and dscp-code-point are optional, but one must be set.
- `drop-packet`—Drops a matching packet before it can reach its destination but does not close the connection. Use this action to drop packets for attacks in traffic that is prone to spoofing, such as UDP traffic. Dropping a connection for such traffic could result in a denial of service that prevents you from receiving traffic from a legitimate source-IP address.
- `drop-connection`—Drops all packets associated with the connection, preventing traffic for the connection from reaching its destination. Use this action to drop connections for traffic that is not prone to spoofing.
- `close-client`—Closes the connection and sends an RST packet to the client but not to the server.
- `close-server`—Closes the connection and sends an RST packet to the server but not to the client.
- `close-client-and-server`—Closes the connection and sends an RST packet to both the client and the server.
- `recommended`—All predefined attack objects have a default action associated with them. This is the action that Juniper Networks recommends when that attack is detected.

> **NOTE**: The actions are listed in the ascending order of severity from low to high. The most severe action is used when there are multiple rule hits for a single session.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.2.

- Syntax | 1787
- Hierarchy Level | 1787
- Description | 1787
- Default | 1788
- Required Privilege Level | 1788
- Release Information | 1788

Syntax

```
action-shutdown;
```

Hierarchy Level

- For platforms with Enhanced Layer 2 Software (ELS):

```
[edit forwarding-options storm-control-profiles profile-name]
```

- For platforms without ELS:

```
[edit ethernet-switching-options storm-control]
```

Description

Logically shut down or temporarily disable interfaces when the storm control level is exceeded.

To configure the shutdown action so that the interfaces are disabled temporarily, and recover automatically after a specified period of time:

- (MX Series, QFX Series, and EX switches that support ELS) Configure both the `action-shutdown` and the `recovery-timeout` statements. The interfaces recover automatically when the recovery timeout expires.

- (EX switches that do not support ELS) Configure both the `action-shutdown` and the `port-error-disable` statements. The interfaces recover automatically when the disable timeout expires. (The `port-error-disable` statement is not supported on QFX Series switches or MX Series routers.)

If you configure the `action-shutdown` statement without configuring either the `port-error-disable` or `recovery-timeout` statement, the interfaces that are enabled for storm control are shut down when the storm control level is exceeded and they do not recover automatically from that port-error condition.

If you do not configure the switch for autorecovery from the disabled condition, you can bring up the disabled interfaces by running one of the following commands:

- (MX Series)—Issue the `clear bridge recovery-timeout`
- (QFX Series)—Issue the `clear ethernet-switching recovery-timeout`
- (EX Series switches that support ELS)—Issue the `clear ethernet-switching recovery-timeout`
- (EX Series switches that do not support ELS)—Issue the `clear ethernet-switching port-error`

> **NOTE**: On EX4300 switches, `action-shutdown` causes an interface to stop learning MAC addresses and it also drops all incoming packets, but does not disable the physical interface.

Default

The `action-shutdown` option is not enabled by default. The switching device drops packets for the controlled traffic types if the ingress rate of the combined traffic streams exceeds the specified storm control level. Depending upon the configuration, applicable traffic could include broadcast, unknown unicast, and multicast traffic.

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.6.

Hierarchy level `[edit forwarding-options]` introduced in Junos OS Release 13.2X50-D10. (See Using the Enhanced Layer 2 Software CLI for information about ELS.)

[edit protocols uplink-failure-detection]
```

Description

Define an action on uplink-failure-detection group state change.

Options

log Generate a system log message.

Required Privilege Level

admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1.

actions

IN THIS SECTION

- Syntax | 1790
- Hierarchy Level | 1791
- Description | 1791
- Options | 1791
- Required Privilege Level | 1792
- Release Information | 1793

Syntax

```
actions {
    allow-strong-certificate;
    crl {
```

```
        disable;
        if-not-present (allow | drop);
        ignore-hold-instruction-code;
    }
    disable-session-resumption;
    ignore-server-auth-failure;
    log {
        all;
        errors;
        info;
        sessions-allowed;
        sessions-dropped;
        sessions-ignored;
        sessions-whitelisted;
        warning;
    }
    renegotiation {
        (allow | allow-secure | drop);
    }
}
```

Hierarchy Level

```
[edit services ssl proxy (Services) profile (Services SSL Proxy)]
```

Description

Specify the logging and traffic related actions for a SSL proxy profile.

An SSL proxy profile is required to configure SSL proxy on your SRX Series Firewall. As a part of the proxy profile configuration, you can configure– actions related to certification revocations checks, options to specify if a change in SSL parameters requires renegotiation for a session, option to disable session resumption, option to ignore certificate validation, root CA expiration dates, and other such issues based on your requirements.

Options

- `allow-strong-certificate`—Enable devices to use the RSA certificates with key size 4,096 bits. By default, this option is disabled. Option is available on SRX300, SRX320, and SRX380 devices in standalone mode.

Default - Not configured.

- `crl`—Specify the certificate revocation actions.
  - `disable`—Disable CRL verification.
  - `if-not-present`—Specify actions for sessions.
    - `allow`—Allow sessions when CRL information is not available.
    - `drop`—Drop sessions when CRL information is not available.
  - `ignore-hold-instruction-code`—Ignore the unconfirmed (on hold) revocation status, and accept a certificate.
- `disable-session-resumption`—Disable session resumption.
- `ignore-server-auth-failure`—Ignore server authentication failure.
- `log`—Specify the logging actions.
  - `all`—Log all events.
  - `errors`—Log all error events.
  - `info`—Log all information events.
  - `sessions-allowed`—Log SSL session allowed events after an error.
  - `sessions-dropped`—Log only SSL session dropped events.
  - `sessions-ignored`—Log session ignored events.
  - `sessions-whitelisted`—Log SSL session allowlisted events.
  - `warning`—Log all warning events.
- `renegotiation`—Specify the renegotiation options.
  - `allow`—Allow secure and nonsecure renegotiation.
  - `allow-secure`—Allow secure negotiation only.
  - `drop`—Drop session on renegotiation request.

Required Privilege Level

services—To view this statement in the configuration.

services-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1X44-D10. The `crl` statement is supported from Junos OS Release 15.1X49-D30.

actions (Services SSL Initiation)

IN THIS SECTION

- Syntax | 1793
- Hierarchy Level | 1794
- Description | 1794
- Options | 1794
- Required Privilege Level | 1794
- Release Information | 1794

Syntax

```
actions {
    crl {
        disable;
        if-not-present (allow | drop);
        ignore-hold-instruction-code;
    }
    ignore-server-auth-failure;
}
```

Hierarchy Level

```
[edit services ssl initiation profile profile-name]
```

Description

Specify the certification revocation checks and traffic related actions for configuring SSL initiation support service. As a part of SSL initiation profile, you can specify actions related to certification revocations checks and chose an option to ignore certificate validation, root CA expiration dates, and other such issues based on your requirements. Commonly ignored errors include the inability to verify CA signature, incorrect certificate expiration dates, and so forth. We do not recommend using this option for authentication because configuring it results in websites not being authenticated at all.

Options

- `crl`—Specify the certificate revocation actions.
  - `disable`—Disable CRL verification.
  - `if-not-present`—Specify actions for sessions.
    - `allow`—Allow sessions when CRL information is not available.
    - `drop`—Drop sessions when CRL information is not available.
  - `ignore-hold-instruction-code`—Ignore the unconfirmed (on hold) revocation status, and accept a certificate.
- `ignore-server-auth-failure`—Ignore server authentication failure.

Required Privilege Level

services—To view this statement in the configuration.

services-control—To add this statement to the configuration.

generate | static) (defaults | route)],
[edit routing-options (aggregate | generate | static) (defaults | route)],
[edit routing-options rib routing-table-name (aggregate | generate | static) (defaults | route)]
```

Description

Determine whether static, aggregate, or generated routes are removed from the routing and forwarding tables when they become inactive. Static routes are only removed from the routing table if the next hop becomes unreachable. This can occur if the local or neighbor interface goes down. Routes that have been configured to remain continually installed in the routing and forwarding tables are marked with **reject** next hops when they are inactive.

- **active**—Remove a route from the routing and forwarding tables when it becomes inactive.
- **passive**—Have a route remain continually installed in the routing and forwarding tables even when it becomes inactive.

Include the `active` statement when configuring an individual route in the **route** portion of the `static` statement to override a **passive** option specified in the **defaults** portion of the statement.

Default

active

Required Privilege Level

routing—To view this statement in the configuration.

active-leasequery (DHCP Local Server)

IN THIS SECTION

- Syntax | 1807
- Hierarchy Level | 1807
- Description | 1807
- Options | 1807
- Required Privilege Level | 1808
- Release Information | 1808

Syntax

```
active-leasequery {
             topology-discovery;
             peer-address {
                address;
               }
             timeout timeout;
             idle-timeout idle-timeout;
             exclude-interface interface-name;
       }
```

Hierarchy Level

```
[edit system services dhcp-local-server]
```

```
[edit system services dhcp-local-server dhcpv6]
```

Description

Subscriber redundancy on DHCP server focuses on subscriber synchronization between the peer servers using active leasequery. If you configure active leasequery for the DHCP server, the peer servers establishes TCP connection and sends active leasequery.

Options

idle-timeout *idle-timeout*

Configure the idle time out value in seconds for the connection between the peer servers.

- Range: 10 thru 3600 seconds
- Default: 60 seconds

peer-address *address*

Configure IPv4 or IPv6 address of the peer DHCP servers. You can configure maximum five IP addresses.

timeout *timeout*

Configure the TCP read/write block timeout value to terminate and restart the TCP connection.

- Range: 10 thru 3600 seconds
- Default: 60 seconds

topology-discovery Enable the topology discovery option.

exclude-interface *interface-name* (Optional) Exclude interface participating in active leasequery.

> **NOTE:**
> `exclude-interface` *`interface-name`*

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 21.4R1.

active-leasequery (DHCP Relay Agent)

IN THIS SECTION

- Syntax | 1809
- Hierarchy Level | 1809
- Description | 1809
- Options | 1809
- Required Privilege Level | 1811
- Release Information | 1811

Syntax

```
active-leasequery {
    idle-timeout seconds;
    peer-address address;
    timeout seconds;
    topology-discover;
}
```

Hierarchy Level

```
[edit forwarding-options dhcp-relay],
[edit forwarding-options dhcp-relay dhcpv6],
[edit logical-systems logical-system-name ...],
[edit logical-systems logical-system-name routing-instances routing-instance-name ...],
[edit routing-instances routing-instance-name ...]
```

Description

Enable support for active leasequery on a DHCPv4 or DHCPv6 relay agent. You can also configure parameters that the DHCP relay agent uses when sending DHCP active lease query messages to obtain lease information from the DHCP servers in the logical system/routing instance.

> **NOTE**: Stale-timer configuration is required to support an Active-Active lease query. This configuration optimizes the synchronization time when both the peers get the solicit packets at the same time.

Options

idle-timeout *seconds*

(Optional) Specify the number of seconds that pass with no activity before the TCP connection is terminated and restarted.

During active leasequery operations, binding information is updated only when it changes. Consequently, there are periods during which the server or peer relay agent sends no information; the connection is idle. If this period is longer than the idle-timeout, the connection is dropped. To avoid inappropriate connection drops, the server or peer relay agent sends DHCPLEASEACTIVE (DHCPv4) or LEASEQUERY-DATA (DHCPv6) messages

at intervals equal to one-half of the idle timeout period. These messages contain no binding information because they are sent when no updates are available. These messages keep the connection alive by serving as hello or keepalive messages signaling that the lack of activity is not a problem.

- **Range:** 10 through 3600
- **Default:** 60

peer-address *address*

(Optional) Specify the address of a peer relay agent to synchronize binding information. You can configure up to five peer addresses. If the subscriber configuration and interface names are identical on peer relay agents, then active leasequery provides 1:1, chassis-level redundancy between peers for binding information.

> **NOTE**: You can also achieve 1:1 chassis redundancy with an M:N redundancy configuration where:
>
> - You configure redundancy for all DHCP subscribers on the chassis
> - You configure a single chassis to back up all of the subscriber redundancy groups

timeout *seconds*

(Optional) Specify the number of seconds that TCP read/write operations can be blocked before the TCP connection is terminated and restarted.

- **Range:** 10 through 3600
- **Default:** 120

topology-discover

(Optional) Activate the topology discovery mechanism to discover peer access links for a redundancy group and their connections to the local access link. You configure this option on peer relay agents hosted on BNGs that are configured for M:N subscriber redundancy.

> **NOTE**: Configure interfaces participating in redundancy for a subset of subscribers and not for the entire chassis.
>
> Topology discovery is needed only for M:N subscriber redundancy. Topology discovery synchronizes only the subscribers stacked over configured interfaces.
>
> Chassis-to-chassis based redundancy provides the following limitations and advantages:

- Topology discovery cannot be configured.
- Supports both single-stack or dual-stack subscribers.
- Synchronizes all subscribers in the routing instance.
- It is recommended to configure chassis-to-chassis based redundancy for scaling.

1. Each peer relay agent sends topology discovery request messages over the TCP connection to each peer relay agent.
2. The receiving peer returns a topology discovery response message with information about its corresponding access interface.
3. The querying relay agent then updates its translation table to map the remote (peer) access interface with its local access interface.

Each relay agent peer initiates topology discovery for all of its access interfaces. Each peer then updates its own translation table according the information received in topology discovery responses.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 19.1R1.

`topology-discover` option added in Junos OS Release 19.2R1.

active-policy

IN THIS SECTION

Syntax | 1812

- Hierarchy Level | 1812
- Description | 1812
- Options | 1812
- Required Privilege Level | 1812
- Release Information | 1812

Syntax

```
active-policy policy-name;
```

Hierarchy Level

```
[edit security idp]
```

Description

Specify which policy among the configured policies to activate.

Options

policy-name—Name of the active policy.

> **NOTE**: You need to make sure the active policy is enforced in the data plane.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.2.

Starting with Junos OS Release 18.2R1, IDP policy is directly assigned in the security policy rule. This is to simplify IDP policy usage and to provide flexibility to have multiple policies active at the same time. As a part of session interest check IDP will enabled if IDP policy is present in any of the matched rules. IDP policy is activated in security policies, by permitting the IDP policy within the application services using the `set security policies from-zone zone-name to-zone zone-name policy policy-name then permit application-services idp-policy idp-policy-name` command. Since IDP policy name is directly use in the security policy rule, the `[edit security idp active-policy policy-name]` statement is deprecated.

```

Hierarchy Level

[edit security advance-policy-based-routing]

Description

Specify parameter settings for an active probe.

Application performance is monitored and measured using active probes.

In active probing, custom packets are sent between a spoke device and a hub device on multiple routes to measure RTT, jitter, and packet loss between the book-ended points. You can configure to send active probes periodically on all the active and passive links.

Active probing starts after the configuration is committed. A configured number of samples are collected and used for measuring the SLA. If there is a violation detected for any application, the probe metrics are evaluated to determine the best possible link for that application traffic in order to meet performance requirements as in the SLA.

Consider the example, where you configure the probe count as 1000, probe interval as 10 seconds, and burst size as 100. Burst count is calculated as probe count/burst size (1000/100 = 10). Burst-count is 10. So, probes are sent in sets of 10 bursts each containing 100 packets.

Burst interval is calculated as probe interval/burst-count (10/10 =1). Burst interval is 1 second. So, a burst is sent every 1 second. The active probe is initiated from the spoke device to the hub device on each of the overlay path.

SaaS application types do not support ingress, egress jitter types.

The SaaS probe packets are HTTP head packets, sent between the spoke device and the SaaS server.

Options

probe-name Active probe identifier.

burst-size Number of probes sent as a burst. This value should be less than or equal to probe-count. The burst-size configuration is ignored for SaaS probing and always burst size will be used as one.

- **Range:** 1—100
- **Default:** 10

data-fill *string* Data payload for a probe packet. This is a hexadecimal string, which is used the payload for probe. Not supported for SaaS probing.

data-size *size* Size of the data portion. Not supported for SaaS probing.

dscp-code-points *dscp* DiffServ code point (DSCP) bits value.

enable-sla-export Time Interval (in seconds) at which the active probe data to be exported to controller. This option is disabled by default.

- **Range:** 60-600

forwarding-class *forwarding-class-name* Name of the forwarding class

- **Default:** network-control

loss-priority *level* Map packet values to a loss priority. Loss priority allows you to set the priority for dropping packets. Typically, you mark packets exceeding some service level with a high loss priority—that is, a greater likelihood of being dropped. Level can be one of the following:

- high—Packet has high loss priority.
- medium-high—Packet has medium-high loss priority.

- medium-low—Packet has medium-low loss priority.
- low—Packet has low loss priority.

per-packet-loss-timeout

Time interval between two consecutive SaaS probes.

- **Range:** 100 through 10000 milliseconds.
- **Default:** 1000 milliseconds.

probe-count *count*

Number of samples required to be collected for an SLA measurement. For SaaS applications, probing is to the actual server, we recommend to use three to four samples per probe window.

- **Range:** 1 through 1000
- **Default:** 5

probe-interval *interval*

Time interval between successive probes. Starting in Junos OS release 20.4R1, the upper limit of the probe interval is changed to 60 seconds. For SaaS applications, we recommend to configure 60 seconds interval to avoid aggressive probing to an actual SaaS server.

- **Range:** 1 through 60 seconds
- **Default:** 10 seconds

Required Privilege Level

services—To view this statement in the configuration.

services-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 18.2R1. The options `forwarding-class` and `loss-priority` are introduced in Junos OS Release 19.2R1.

Description

Apply a DHCP relay agent configuration to the named group of DHCP server addresses. The server group itself is configured with the `server-group` statement. You can apply an active server group globally or for specific groups of interfaces, configured with the `group` statement. An active server group applied to an interface group overrides a global configuration.

Options

allow-server-change (Optional) (DHCPv4 only) Enable the relay agent to accept and forward a DHCP request (renew or rebind) ACK message to the client from any DHCP local server in the active server group. Starting in Junos OS Release 18.4R1, this option also applies to DHCP information request (DHCPINFORM) ACK messages.

- **Default:** Forward ACK messages from only the original binding server.

server-group-name Name of the group of DHCP or DHCPv6 server addresses to which the DHCP or DHCPv6 relay agent configuration applies.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.3.

Support at the `[edit ... dhcpv6]` hierarchy levels introduced in Junos OS Release 11.4.

`allow-server-change` option added in Junos OS Release 16.2R1.

    src-ip src-ip;
 }
 minimum-interval minimum-interval;
 multiplier multiplier;
  }
```

Hierarchy Level

```
[edit chassis high-availability services-redundancy-group]
```

Description

Specify the probes for split-brain detection.

Options

bfd-liveliness— BFD-based probes to prevent split-brain scenarios.

dest-ip *ip-address*— destination IP address to send the probe requests. Use this option for ICMP based probes for split-brain detection.

- routing-instance *name*—Routing instance used by the probe requests.
- src-ip *ip-address*—Source IP address to send the probe requests.

> **NOTE**: ICMP-based split-brain probing and BFD-based split-brain probing are mutually exclusive.

minimal-interval *milliseconds*— (Optional) Time period between the probes sent to the destination IP address. You can configure 1000 milliseconds for minimal interval activeness probes. (supported in default gateway [switching] and hybrid deployments).

multiplier *number*— (Optional) Time period, after which the backup node transitions to the active state, if the backup node fails to receive response to the activeness-probes from the peer node. (supported in default gateway [switching] and hybrid deployments).

- **Range:** 2 through 15

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

- Default | 1824
- Required Privilege Level | 1824
- Release Information | 1824

Syntax

```
actual-transit-statistics;
```

Hierarchy Level

```
[edit dynamic-profiles profile-name interfaces $junos-interface-ifd-name unit $junos-interface-
unit]
```

Description

Enable `actual-transit-statistics` to enable the collection and reporting of accurate accounting statistics for subscribers. The accurate statistics provide packet-level and byte-level counts for all transmit and receive traffic forwarded across the specified interface. The counts do not include overhead bytes, filtered traffic, drops, discards, or control traffic. These accurate statistics match the accounting statistics used by RADIUS. You can display these statistics with the `show subscribers id` *`session-id`* `accounting-statistics` and `show subscribers interface` *`interface`* `accounting-statistics` commands.

> **NOTE**: Starting in Junos OS Release 18.4R1, you must enable `actual-transit-statistics` to collect subscriber statistics. If you do not configure this statement, subscriber statistics are not collected; the `show subscribers accounting-statistics` command displays a value of 0 for subscriber statistics; and the subscriber statistics are reported to RADIUS with values of zero.

Default

Disabled.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.4R1.

[edit interfaces interface-range              name logical-tunnel-options load-balance]
```

Description

Correct a genuine traffic imbalance by using a feedback mechanism to distribute the traffic across the links of an aggregated Ethernet bundle.

Options

pps

(PTX Series only) The type of traffic rate among the members of the AE bundle is measured packets per second. The default rate type is bytes per second.

scan-interval *multiple*

(PTX Series only) Scan interval, as a multiple of a 30-second interval.

- **Range:** 1 through 5
- **Default:** 1

tolerance *tolerance-percentage*

(MX Series and PTX Series) Limit to the variance in the packet traffic flow to the aggregated Ethernet links in a percentage.

- **Range:** 1 through 100 percent
- **Default:** 20 percent

Required Privilege Level

interface - To view this statement in the configuration.

- Required Privilege Level | 1831
- Release Information | 1831

Syntax

```
adaptive-sample-rate rate {
    fallback;
    sample-limit-threshold sample-limit-threshold;
}
```

Hierarchy Level

```
[edit protocols sflow]
```

Description

Configure and back up the adaptive sampling rate in sFlow monitoring technology configurations.

Routers and switches use adaptive sampling to ensure both sampling accuracy and efficiency. Adaptive sampling is a process of monitoring the overall incoming traffic rate on the network device and providing intelligent feedback to interfaces to dynamically adapt the sampling rates on interfaces on the basis of traffic conditions.

Default

Adaptive sampling is enabled by default.

You can use this `adaptive-sample-rate` configuration statement to change the default adaptive sampling from 300 pps to any other value.

Options

rate Configure the maximum number of samples that should be generated.

- **Range:** 300 through 9500 pps

> **NOTE**: You can configure the adaptive sampling rate on QFX5230-64CD, QFX5240-64OD, and QFX5240-64QD devices to a maximum number of 30000 pps.

fallback Enable adaptive sampling fallback (also called reverse adaptive sampling).

sample-limit-threshold Explicitly specify the threshold value in packets per second (pps) for each line card. You must configure the `fallback` statement to be able to configure the `sample-limit-threshold` statement.

- **Range:** 0 through 4750 pps.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3R2.

`adaptive-sample-rate` limit is increased in Junos OS Release 19.1R1.

`adaptive-sample-rate` limit is increased in Junos OS Evolved Release 24.4R1.

- Release Information | 1839

Syntax

```
add-attribute-length-in-pdu;
```

Hierarchy Level

```
[edit protocols mvrp]
```

Description

Add an extra byte in protocol data units (PDUs) sent by the Multiple VLAN Registration Protocol (MVRP) in Junos OS Releases 11.3 and later for EX Series switches that do not support the Enhanced Layer 2 Software (ELS). By default, this MVRP version does not include the extra byte. You can add the extra byte in this MVRP version to address an incompatibility issue with the following MVRP versions:

- MVRP in Junos OS Releases 11.2 and earlier, which includes the extra byte.
- MVRP in Junos OS Releases 13.2 and later for EX Series switches with support for ELS, which includes the extra byte.

If this incompatibility issue arises, the MVRP versions that include the extra byte do not recognize PDUs that do not include the extra byte.

You can recognize an MVRP version problem by looking at a switch running an MVRP version that includes the extra byte. Because a switch running an MVRP version that includes the extra byte cannot

interpret an unmodified PDU from an MVRP version that does not include the extra byte, the switch will not add VLANs from the MVRP version that does not include the extra byte. When you execute the command `show mvrp statistics` on the MVRP version that includes the extra byte, the values for *Join Empty received* and *Join In received* will incorrectly display zero, even though the value for *MRPDU received* has been increased. Another indication that MVRP is having a version problem is that unexpected VLAN activity, such as multiple VLAN creation, takes place on the switch running the MVRP version that includes the extra byte.

Required Privilege Level

routing—To view this statement in the configuration.
routing control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.3.

```

Description

Enable advertisement and/or reception of multiple paths to a destination to/from the same BGP peer, instead of advertising/receiving only the active path to/from the same BGP peer.

> **NOTE**: The minimum configuration for the send side is `add-path send path-count <n>`. The configuration for the receive side is `add-path send receive`.
>
> You cannot just configure `add-path`. You must configure at least one `send/receive`. (If you attempt to configure only `add-path`, it will fail.) If only `send/receive` is configured, the corresponding support is enabled: `send` for advertisement of add-path routes and `receive` for reception of add-path routes.

> **NOTE**: The effective `receive/send add-path` state of a BGP session depends on the `add-path` capability advertisement from both the ends. That is, if R1 configures `send`, but R2 doesn't configure `receive`, then R1 will not send `add-path` to R2.

> **NOTE**: On PTX1000 devices, the `add-path` configuration statement is not supported under routing instances.

Options

receive Enable the router to receive multiple paths to a destination. You can enable the router to receive multiple paths from specified neighbors or from all neighbors.

The remaining statement is explained separately. See CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.3.

Support for range from 2 through 20 (for BGP) introduced in Junos OS Release 14.1.

`multipath` option introduced in Junos OS Release 16.1R2.

Support for 64 BGP add-paths introduced in Junos OS Release 18.4R1 for the MX Series.

`include-backup-path` and `path-selection-mode` options introduced in Junos OS Release 18.4R1 for the MX Series and PTX Series.

                }
            }
            route ip-address/mask routing-instance instance-name priority-cost cost;
        }
        virtual-address [ addresses ];
    }
}
```

Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number family family],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number
family  family]
```

Description

Configure the interface address.

NOTE: If you configure the same address on multiple interfaces in the same routing instance, Junos OS uses only the first configuration, and the remaining address configurations are ignored and can leave interfaces without an address. Interfaces that do not have an assigned address cannot be used as a donor interface for an unnumbered Ethernet interface.

For example, in the following configuration the address configuration of interface xe-0/0/1.0 is ignored:

```
interfaces {
  xe-0/0/0 {
    unit 0 {
      family inet {
        address 192.168.1.1/8;
      }
    }
  }
  xe-0/0/1 {
    unit 0 {
     family inet {
       address 192.168.1.1/8;
     }
  }
}
```

For more information on configuring the same address on multiple interfaces, see Configuring the Interface Address.

- In Junos OS Release 13.3 and later, when you configure an IPv6 host address and an IPv6 subnet address on an interface, the commit operation fails.
- In releases earlier than Junos OS Release 13.3, when you use the same configuration on an interface, the commit operation succeeds, but only one of the IPv6 addresses that was entered is assigned to the interface. The other address is not applied.

Options

address—Address of the interface.

subnet-router-anycast—IPv6 host address to communicate with any of the routers present on the link.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

NOTE: The `edit logical-systems` hierarchy is not available on QFabric systems.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

address (Address Book Next Gen Services)

IN THIS SECTION

- Syntax | 1853
- Hierarchy Level | 1853
- Description | 1853
- Options | 1853
- Required Privilege Level | 1853
- Release Information | 1853

Syntax

```
address address-name range-address lower-limit to upper-limit
```

Hierarchy Level

```
[edit services address-book global]
```

Description

Configure a range of addresses that can be referenced in the `match` stanza of a NAT rule.

Options

lower-limit	The lower end of the address range.
upper-limit	The upper end of the address range.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 19.3R2.

address-allocation

IN THIS SECTION

- Syntax | 1854
- Hierarchy Level | 1854

Description | 1854
Required Privilege Level | 1854
Release Information | 1854

Syntax

```
address-allocation round-robin;
```

Hierarchy Level

```
[edit services nat pool pool-name]
```

Description

When you use round-robin allocation, one port is allocated from each address in a range before repeating the process for each address in the next range. After ports have been allocated for all addresses in the last range, the allocation process wraps around and allocates the next unused port for addresses in the first range.

Regardless of whether the round-robin method of allocation is addresses is enabled by using the `address-allocation round-robin` statement, round-robin allocation is enabled by default on MS-MICs and MS-MPCs.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.2.

address (Analytics Collector)

IN THIS SECTION

- Syntax | 1855
- Hierarchy Level | 1855
- Description | 1855
- Options | 1856
- Required Privilege Level | 1856
- Release Information | 1856

Syntax

```
address ip-address {
    port number {
        transport protocol {
            export-profile profile-name;
        }
    }
}
```

Hierarchy Level

```
[edit services analytics collector]
```

Description

Configure the address of a remote server to receive streamed analytics (queue and traffic statistics) data.

NOTE: The `address` statement is not available in Junos OS Releases prior to 13.2X51-D15.

Options

ip-address	IP address of the remote server receiving the streamed data.
port *number*	Port number of the remote server receiving the streaming data.
export-profile *profile-name*	Name of the export profile containing the parameters for the analytics data being streamed.

transport *protocol*	A transport protocol used to stream data to the port.
	• Values:
	  • **tcp**—Transmission Control Procol (TCP)
	  • **udp**—User Datagram Protocol (UDP)

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2.

address (Anycast RPs)

IN THIS SECTION

- Syntax | 1857
- Hierarchy Level | 1857

- Description | 1857
- Options | 1857
- Required Privilege Level | 1857
- Release Information | 1858

Syntax

```
address address <forward-msdp-sa>;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols pim rp local (inet | inet6) anycast-pim rp-set],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols pim
rp local (inet | inet6) anycast-pim rp-set],
[edit protocols pim rp local (inet | inet6) anycast-pim rp-set],
[edit routing-instances routing-instance-name protocols pim rp local (inet | inet6) anycast-pim rp-
set]
```

Description

Configure the anycast rendezvous point (RP) addresses in the RP set. Multiple addresses can be configured in an RP set. If the RP has peer Multicast Source Discovery Protocol (MSDP) connections, then the RP must forward MSDP source active (SA) messages.

Options

address—RP address in an RP set.

forward-msdp-sa—(Optional) Forward MSDP SAs to this address.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 7.4.

        link pool-name;
    }
}
```

Hierarchy Level

```
[edit access]
```

Description

The address-assignment pool feature enables you to create different pools with different attributes. For example, multiple client applications, such as DHCPv4 or DHCPv6, can use an address-assignment pool to provide addresses for their particular clients.

Options

- `host` *`hostname`*—Name by which a network-attached device is known on a network.
- `hardware-address` *`mac-address`*—Specify the MAC address of the client. This is the hardware address that identifies the client on the network.
- `ip-address` *`reserved-address`*—Specify the reserved IP address.
- `user-name`—Specify username or IKE ID.
- `xauth-attributes`—Specify XAuth attributes to use in XAuth authentication.
- `primary-dns-ipv6`—Specify the primary-dns IPv6 address.
- `secondary-dns-ipv6`—Specify the secondary-dns IPv6 address.

Required Privilege Level

access—To view this statement in the configuration.

access-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.4.

`xauth-attributes` option under `inet6` is introduced in Junos OS Release 20.3R1.

`user-name` option under `inet host` *`host-name`* is introduced in Junos OS Release 20.3R1.

`host` option under `inet6` is introduced in Junos OS Release 20.3R1.

address-assignment (Address-Assignment Pools)

            }
        }
        hold-down;
        link pool-name;
    }
}
```

Hierarchy Level

```
[edit access]
```

Description

Configure address-assignment pools that can be used by different client applications.

> **NOTE**: Support for subordinate statements is platform-specific. See individual statement topics for support information.

Options

abated-utilization

Generate SNMP traps for DHCP address pools or linked set of address pools. No SNMP traps are generated unless a value is configured. Default: Abated utilization is not set. Delete the abated-utilization value to unset.

- **Values:** *percentage*—Threshold below which an SNMP trap clear is generated. Range: 1 through 98.

abated-utilization-v6

Generate SNMP traps for DHCPv6 address pools or linked set of address pools. No SNMP traps are generated unless a value is configured. Default: Abated utilization is not set. Delete the abated-utilization value to unset.

- **Values:** *percentage*—Threshold below which an SNMP trap clear is generated. Range: 1 through 98.

high-utilization

Generate an SNMP trap when the DHCP address pool or linked set of address pools use surpasses the specified percentage. Default: High utilization is not set. Delete the high-utilization value to unset.

- **Values:** *percentage*—Percentage used to generate a trap. Range: 2 through 99.

high-utilization-v6

Generate an SNMP trap when the DHCPv6 address pool or linked set of address pools use surpasses the specified percentage. Default: High utilization is not set. Delete the high-utilization value to unset.

- **Values:** *percentage*—Percentage used to generate a trap. Range: 2 through 99.

neighbor-discovery-router-advertisement

Configure the name of the address-assignment pool used to assign the router advertisement prefix.

- **Values:** *ndra-pool-name*—Name of the address-assignment pool.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.0.

        zone zone-name;
    }
    description (Security Address Book) text;
}
```

Hierarchy Level

```
[edit security]
[edit tenants tenant-name security]
```

Description

Define entries in the address book. Address book entries can include any combination of IPv4 addresses, IPv6 addresses, DNS names, wildcard addresses, and address range. You define addresses and address sets in an address book and then use them when configuring different features, such as security policies and NAT.

NOTE: IPv6 wildcard address configuration is not supported in this release.

Options

- `address-book` *`book-name`*–Name of the address book.
- `global`–An address book that is available by default. You can add any combination of IPv4 addresses, IPv6 addresses, wildcard addresses, DNS names, or address range to the global address book. You do not need to attach the global address book to a security zone; entries in the global address book are available to all security zones that are not attached to address books.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

security—To view this statement in the configuration.

tenants—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5. Statement introduced in Junos OS Release 18.3R1 for tenant systems. Support for wildcard addresses added in Junos OS Release 11.1. Statement moved under the security hierarchy in Junos OS Release 11.2. Support for address range added in Junos OS Release 12.1. The `description` option added in Junos OS Release 12.1.

Understanding Address Sets

address-book (System)

IN THIS SECTION

- Syntax | **1871**
- Hierarchy Level | **1871**
- Description | **1871**
- Options | **1871**
- Required Privilege Level | **1872**
- Release Information | **1872**

Syntax

```
address-book {
    maximum amount;
    reserved amount;
}
```

Hierarchy Level

```
[edit system security-profile security-profile-name]
```

Description

Address book entries include any combination of IPv4 addresses, IPv6 addresses, DNS names, wildcard addresses, and address range. You define addresses and address sets in an address book and then use those addresses when configuring different features, such as security policies and NAT.

Specify the number of address books that user logical system administrators and primary logical system administrators can configure for their logical systems if the security profile is bound to the logical systems.

The primary administrator:

- uses security profiles to provision logical systems with resources.
- binds security profiles to user logical systems and the primary logical system.
- can configure more than one security profile, specifying different amounts of resource allocations in various profiles.

Only the primary administrator can create security profiles and bind them to logical systems.

Options

- `maximum` *amount*—A maximum allowed quota. If a logical system requires more of a resource than its reserved amount allows, it can utilize resources configured for the global maximum amount if they are available—that is, if they are not allocated to other logical systems. The maximum allowed quota specifies the portion of the free global resources that the logical system can use. The maximum allowed quota does not guarantee that the amount specified for the resource in the security profile is available. Logical systems compete for global resources.

- `reserved` *`amount`*—A reserved quota that guarantees that the resource amount specified is always available to the logical system.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.2.

address-mapping;
```

Hierarchy Level

```
[edit logical-systems name security nat source rules-set name rule name then source-nat],
[edit logical-systems name tenants name security nat source rule name then source-nat],
[edit security nat source rule-set ruleset rule rule then source-nat interface persistent-nat],
[edit services nat source rule-set name rule name then source-nat],
[edit tenants name security nat source rule-set name rule name then source nat]
```

Description

Allows requests from a specific internal IP address to be mapped to the same reflexive IP address (the public IP address created by the NAT device closest to the STUN server); internal and external ports can be any ports. An external host using any port can send a packet to the internal host by sending the packet to the reflexive IP address (with a configured incoming policy that allows external to internal traffic). If this option is not configured, the persistent NAT binding is for specific internal and reflexive transport addresses.

You can only specify this option when the persistent NAT type is `any-remote-host` and the source NAT rule action is one of the following:

- Source NAT pool with IP address shifting
- Source NAT pool with no port translation and no overflow pool

Required Privilege Level

`security`—To view this statement in the configuration.

`security-control`—To add this statement to the configuration

Release Information

Syntax

```
address-mapping address-name {
    filter {
        ip ip-address-and-prefix-length;
        port-range {
            tcp [port];
            udp [port];
        }
    }
}
```

Hierarchy Level

[edit services application-identification application *application-name*]

Description

Match the specified IP address.

Layer 3 and Layer 4 address mapping defines an application by the IP address and optional port range of the traffic. You can use the address mapping option to configure custom applications signatures when the configuration of your private network predicts application traffic to or from trusted servers.

Address mapping provides efficiency and accuracy in handling traffic from a known application.

Options

name Address mapping name.

filter Specify the application matching criteria by the IP address of the application or the port range to match TCP or UDP destination port.

- ip—IP address and prefix-length.
- port-range—Port range to match a TCP or UDP destination port.
  - **tcp** [*port*]—Define the TCP port range for the application.
  - **udp** [*port*]—Define the UDP port range for the application.

Required Privilege Level

Release Information

Statement introduced before Junos OS Release 7.4.

RELATED DOCUMENTATION

Configuring the Address Mask

address-name

IN THIS SECTION

- Syntax | 1892
- Hierarchy Level | 1893
- Description | 1893
- Options | 1893
- Required Privilege Level | 1893
- Release Information | 1893

Syntax

```
address-name name {
    description description;
    profile {
        category name {
            feed feed;
            property name {
                string name;
            }
        }
        feed-name name;
    }
}
```

Hierarchy Level

```
[edit security dynamic-address]
[edit logical-systems logical-system-name security dynamic-address]
[edit tenants tenant-name security dynamic-address]
```

Description

Specify the security dynamic address name for IPv4 and IPv6 networks within a logical system and tenant system.

Options

- `profile`—Information to categorize feed data into this dynamic address.
  - `feed-name`— Name of feed in feed-server for the dynamic address.
    - `source-feed-name`— Name of feed in feed-server which is mapped to this dynamic address.
  - `category`—Name of category for the dynamic address.
    - `GeoIP` —A list giving you the ability to filter traffic to and from specific geographies in the world.
      - `feed`—Feed to match.
        - `feed-name`—Name of feed (fd1).
    - `ip-filter` —A list of addresses and ranges of malicious sites that can send junk data.
      - `feed`—Feed to match.
        - `feed-name`—Name of feed (fd1).

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 18.4R1.

address (NAT Pool Next Gen Services)

IN THIS SECTION

- Syntax | 1894
- Hierarchy Level | 1894
- Description | 1894
- Options | 1894
- Required Privilege Level | 1895
- Release Information | 1895

Syntax

```
address address-prefix | address address-prefix to address address-prefix;
```

Hierarchy Level

```
[edit services nat destination pool nat-pool-name],
[edit services nat source pool nat-pool-name]
```

Description

Define the addresses or subnets to which source addresses or destination addresses are translated. You can configure a single address, an address range, a single subnet, or a subnet range.

Options

address *address-prefix*	A single address or subnet.
address *address-prefix* to address *address-prefix*	An address range or a subnet range.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 19.3R2.

address (Peer)

IN THIS SECTION

- Syntax | 1895
- Hierarchy Level | 1895
- Description | 1896
- Default | 1896
- Options | 1896
- Required Privilege Level | 1896
- Release Information | 1896

Syntax

```
address ip-address;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols link-management peer peer-name],
[edit protocols link-management peer peer-name]
```

Description

Specify the ID of the peer.

Default

The loopback address is advertised.

Options

ip-address—IP address of the peer.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

RELATED DOCUMENTATION

Configuring the ID for LMP Peers

address-persistent (Security Source NAT)

IN THIS SECTION

- Syntax | 1897
- Hierarchy Level | 1897
- Description | 1897
- Required Privilege Level | 1897
- Release Information | 1897

Syntax

```
address-persistent;
```

Hierarchy Level

```
[edit logical-systems name security nat],
[edit logical-systems name tenants name security nat],
[edit security nat source]
[edit services nat],
[edit tenants name security nat]
```

Description

Enable the device to assign the same, statically chosen, IP address from a source pool to a host for multiple sessions that require the same source IP address for each session. This option is a global configuration and is applied to all source pools. After a session is established from a host and NAT is performed, the subsequent session from the same host will always use the same translated address.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement modified in Junos OS Release 9.2.

address-persistent (Security Source NAT Pool)

IN THIS SECTION

Syntax | 1898

- Hierarchy Level | 1898
- Description | 1898
- Options | 1898
- Required Privilege Level | 1898
- Release Information | 1899

Syntax

```
address-persistent subscriber ipv6-prefix-length prefix-length;
```

Hierarchy Level

```
[edit logical-systems name security nat source pool name address-persistent subscriber],
    [edit logical-systems name tenants name security nat source pool name address-persistent
subscriber],
    [edit security nat source pool name address-persistent subscriber],
    [edit services nat source pool name address-persistent subscriber],
    [edit tenants name security nat source pool name address-persistent subscriber]
```

Description

Enable the device to translate an IPv6 address, with a consistent IPv6 prefix, to the same IPv4 address to ensure that IPv4 services can be used over IPv6-only networks.

Options

ipv6-prefix-length *prefix-length*

Specify the subscriber IPv6 prefix length.

- **Range:** 8 through 128.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3X48-D10.

RELATED DOCUMENTATION

address-pool

IN THIS SECTION

- Syntax | 1899
- Hierarchy Level | 1899
- Description | 1900
- Options | 1900
- Required Privilege Level | 1900
- Release Information | 1900

Syntax

```
address-pool pool-name {
    address address-or-prefix;
    address-range <low lower-limit> <high upper-limit>;
}
```

Hierarchy Level

```
[edit access]
```

Description

Allocate IP addresses for clients.

> **NOTE**: This statement is not supported for L2TP LNS on MX Series routers.

Options

pool-name Name assigned to an address pool.

address (EX Series, M Series, PTX Series, T Series only) Configure the IP address or prefix value for clients.

- **Values:** *address-or-prefix*—An address or prefix value.

address-range Configure the address range.

- Values:
  - high *upper-limit*—Upper limit of an address range.
  - low *lower-limit*—Lower limit of an address range.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

RELATED DOCUMENTATION

Configuring the Address Pool for L2TP Network Server IP Address Allocation

address-pool (Access)

IN THIS SECTION

- Syntax | 1901
- Hierarchy Level | 1901
- Description | 1901
- Options | 1902
- Required Privilege Level | 1902
- Release Information | 1902

Syntax

```
address-pool pool-name {
    address address or address prefix;
    address-range {
        high upper-limit;
        low lower-limit;
        mask network-mask;
    }
    primary-dns IP address;
    primary-wins IP address;
    secondary-dns IP address;
    secondary-wins IP address;
}
```

Hierarchy Level

```
[edit access]
```

Description

Create an address-pool for L2TP clients.

Options

- `pool-name`—Name assigned to the address-pool.
- `address`—Configure subnet information for the address-pool.
- `address-range`—Defines the address range available for clients.
- `primary-dns`—Specify the primary-dns IP address.
- `secondary-dns`—Specify the secondary-dns IP address.
- `primary-wins`—Specify the primary-wins IP address.
- `secondary-wins`—Specify the secondary-wins IP address.

Required Privilege Level

access—To view this statement in the configuration.

access-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.4.

RELATED DOCUMENTATION

access-control

address-pool (Domain Map)

IN THIS SECTION

- Syntax | 1903
- Hierarchy Level | 1903
- Description | 1903
- Options | 1903

Required Privilege Level | 1903
Release Information | 1903

Syntax

```
address-pool pool-name;
```

Hierarchy Level

```
[edit access domain map domain-map-name]
```

Description

Specify the address pool used to assign addresses to subscribers associated with the domain map.

Options

pool-name—Name of address pool.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.4.

RELATED DOCUMENTATION

Specifying an Address Pool in a Domain Map

address-pooling

IN THIS SECTION

- Syntax | 1904
- Hierarchy Level | 1904
- Description | 1904
- Options | 1904
- Required Privilege Level | 1904
- Release Information | 1905

Syntax

```
address-pooling paired;
```

Hierarchy Level

```
[edit services nat rule (Services NAT) rule-name term (Services NAT) term-name then (Services NAT)
translated]
```

Description

Specify the NAT address pooling behavior.

Options

paired—Currently, the only valid setting specifies paired address pooling behavior.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in JUNOS Release 10.1.

RELATED DOCUMENTATION

Network Address Translation Rules Overview

address-pooling (Security Source NAT)

IN THIS SECTION

- Syntax | 1905
- Hierarchy Level | 1905
- Description | 1906
- Options | 1906
- Required Privilege Level | 1906
- Release Information | 1906

Syntax

```
address-pooling (paired | no-paired);
```

Hierarchy Level

```
[edit logical-systems name security nat source pool name address-pooling],
 [edit logical-systems name tenants name security nat source pool name address-pooling],
 [edit security nat source pool name address-pooling],
 [edit services nat source pool name address-pooling],
 [edit tenants name security nat source pool name address-pooling]
```

Description

The `address-pooling paired` and `address-pooling no-paired` options in a source NAT pool enable you to override the global address-persistent configuration and to control the IP addressing in the pool. When either `address pooling-paired` or `address-pooling no-paired` is configured in a NAT source pool, the address-persistent configuration is disabled for that pool.

Use the `address-pooling paired` option in source NAT pools with port translation for applications that require all sessions associated with one internal IP address to be translated to the same external IP address for multiple sessions. (The default behavior for a source NAT pool with port translation pools is address-pooling no-paired.)

Use the `address-pooling no-paired` option in source NAT pools without port translation for assigning IP addresses using a round-robin fashion. (The default behavior for a source NAT pool without port translation is address-pooling paired.)

Options

no-paired	Allow address-pooling no-paired
paired	Allow address-pooling paired

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1X45-D10.

address-pooling (Source NAT Next Gen Services)

IN THIS SECTION

- Syntax | 1907
- Hierarchy Level | 1907
- Description | 1907
- Options | 1907
- Required Privilege Level | 1907
- Release Information | 1908

Syntax

```
address-pooling {
    no-paired;
}
```

Hierarchy Level

```
[edit services nat source pool pool-name]
```

Description

Allow address-pooling no-paired for a source pool without port translation

Options

no-paired Allow address-pooling no-paired for a source pool without port translation.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 19.3R2.

address-pools

IN THIS SECTION

- Syntax | 1908
- Hierarchy Level | 1909
- Description | 1909
- Options | 1909
- Required Privilege Level | 1909
- Release Information | 1909

Syntax

```
address-pools {
    name {
        default-pool;
        family (inet | inet6) {
            network {
                [network-prefix] {
                    external-assigned;
                }
            }
        }
        service-mode service-mode-options;
    }
}
```

Hierarchy Level

```
[edit access address-assignment]
```

Description

Configure the address pools that the TDF domains use to specify the source IP addresses of packets to undergo TDF processing.

Options

name Name of the address pool.

- **Range:** 1 through 63 alphanumeric characters

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

access—To view this statement in the configuration.

access-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.1.

address-protection

IN THIS SECTION

- Syntax | 1910
- Hierarchy Level | 1910
- Description | 1910
- Options | 1911
- Required Privilege Level | 1911
- Release Information | 1912

Syntax

```
address-protection {
    reassign-on-match;
}
```

Hierarchy Level

```
[edit access],
[edit logical-systems logical-system-name routing-instances routing-instance-name access]
```

Description

Prevent IPv4 addresses and IPv6 prefixes from being assigned to more than one subscriber session when you use AAA to supply IPv4 addresses.

For IPv4:

If enabled, the router checks the following attributes received from external servers:

- *Framed-IP-Address*
- *Framed-Pool*

The router then takes one of the following actions:

- If an address matches an address in an address pool, the address is taken from the pool, provided it is available.
- If the address is already in use, it is rejected as unavailable.

For IPv6:

If enabled, the router checks the following attributes received from external servers:

- *Framed-IPv6-Prefix*
- *Framed-IPv6-Pool*

The router then takes one of the following actions:

- If a prefix matches a prefix in an address pool, the prefix is taken from the pool, provided it is available.
- If the prefix is already in use, it is rejected as unavailable.
- If the prefix length requested from the external server does not exactly match the pool's prefix length, the authentication request is denied. If configured, the Acct-Stop message includes the cause for termination.

Options

reassign-on-match

Enable reassignment of an address from an existing subscriber to a new subscriber requesting that address. The address in use must not be part of a locally configured pool and address protection must be enabled. The request from the new subscriber is still rejected, but the existing subscriber is sent a disconnect request to begin the logout process. This enables the new subscriber to renegotiate and be assigned that IP address.

If the requested address is in a locally configured pool, the existing subscriber is not disconnected.

> **NOTE**: This option is not supported for IPv6.

- **Default:** Rejects the address request from the new subscriber; the existing subscriber remains intact with the IP address.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.2.

`reassign-on-match` option added in Junos OS Release 18.4R1.

address (Protocols OpenFlow)

IN THIS SECTION

- Syntax | 1912
- Hierarchy Level | 1912
- Description | 1913
- Options | 1913
- Required Privilege Level | 1913
- Release Information | 1913

Syntax

```
address address;
```

Hierarchy Level

```
[edit protocols openflow switch switch-name controller]
```

Description

Specify the IPv4 address of the OpenFlow controller that will manage OpenFlow on that virtual switch. The switch establishes a connection to the controller using this address.

Options

address	IPv4 address of the OpenFlow controller.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.3.

IN THIS SECTION

- Syntax | **1914**
- Hierarchy Level | **1914**
- Description | **1914**
- Options | **1914**

Required Privilege Level | 1914
Release Information | 1914

Syntax

```
address (Protocols Router Discovery) address {
    (advertise | ignore);
    (broadcast | multicast);
    (ineligible | priority number);
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols router-discovery],
[edit protocols router-discovery]
```

Description

Specify the IP addresses to include in router advertisement packets.

Options

address—IP address. To specify more than one address, specify multiple addresses or include multiple `address` statements.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

address (Security Address Book)

IN THIS SECTION

- Syntax | 1921
- Hierarchy Level | 1921
- Description | 1921
- Options | 1921
- Required Privilege Level | 1922

Release Information | 1922

Syntax

```
address address-name {
    ip-prefix {
        description text;
    }
    description text;
    dns-name domain-name {
        ipv4-only;
        ipv6-only;
    }
    range-address lower-limit to upper-limit;
    wildcard-address ipv4-address/wildcard-mask;
}
```

Hierarchy Level

```
[edit security address-book book-name]
```

Description

Add an entry containing an IP address or DNS hostname, or wildcard address to the address book. An address book contains entries for addressable entities in security zones, policies, and NAT rules. Address book entries can include any combination of IPv4 addresses, IPv6 addresses, and DNS names.

Options

- `address` *`address-name`*–Name of an address entry.
- `description` *`text`*–Descriptive text about an address entry.
- dns-address *`domain-name`*–DNS address name.
- *`ip-prefix`*–IP address with prefix.

- `range-address` *`lower-limit`* `to` *`upper-limit`*–Address range for an address book.
- `wildcard-address` *`ipv4-address/wildcard-mask`*–IPv4 wildcard address in the form of A.B.C.D/wildcard-mask.

> **NOTE**: IPv6 wildcard address configuration is not supported in this release.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5. Support for IPv6 addresses added in Junos OS Release 10.2. Support for IPv6 addresses in active/active chassis cluster configurations (in addition to the existing support of active/passive chassis cluster configurations) added in Junos OS Release 10.4. Support for wildcard addresses added in Junos OS Release 11.1. Support for address range added in Junos OS Release 12.1. The `description` option added in Junos OS Release 12.1.

address (Security ARP Proxy)

IN THIS SECTION

- Syntax | **1923**
- Hierarchy Level | **1923**
- Description | **1923**
- Options | **1923**
- Required Privilege Level | **1923**
- Release Information | **1923**

Syntax

```
address ip-address to <ip-address>;
```

Hierarchy Level

```
[edit logical-systems name security nat proxy-arp interface],
    [edit logical-systems name tenants name security nat proxy-arp interface],
    [edit security nat proxy-arp interface],
    [edit services nat proxy-arp interface],
    [edit tenants name security nat proxy-arp interface]
```

Description

Specify a single address or an address range of ARP proxy.

Options

to	Specify the upper limit of the address range.
ip-address	IP address of an ARP proxy.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement modified in Junos OS Release 9.6.

address (Security Destination NAT)

IN THIS SECTION

- Syntax | 1924
- Hierarchy Level | 1924
- Description | 1924
- Options | 1924
- Required Privilege Level | 1925
- Release Information | 1925

Syntax

```
address <ip-address> {
    (port port-number | to ip-address);
}
```

Hierarchy Level

```
[edit security nat destination pool pool-name],
[edit logical-systems name security nat destination pool],
[edit services nat destination pool],
[edit tenants name security nat destination pool]
```

Description

Specify a single address or an address range of the destination NAT pool.

Options

- *ip-address* —IP address of a pool.
- `port` *port-number*—Specify the port number.

- `to`—Specify the upper limit of the address range.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement modified in Junos OS Release 9.6.

address (Security NDP Proxy)

IN THIS SECTION

- Syntax | 1925
- Hierarchy Level | 1925
- Description | 1926
- Options | 1926
- Required Privilege Level | 1926
- Release Information | 1926

Syntax

```
address ip-address {
    to ip-address;
}
```

Hierarchy Level

```
[edit logical-systems name security nat proxy-ndp interface],
    [edit logical-systems name tenants name security nat proxy-ndp interface],
```

```
[edit security nat proxy-ndp interface],
[edit services nat proxy-ndp interface],
[edit tenants name security nat proxy-ndp interface]
```

Description

Specify a single address or an address range of NDP proxy. IPv6 Neighbor Discovery Protocol (NDP) is to resolve network layer (IP) addresses to link layer addresses, such as Ethernet. Address Resolution Protocol (ARP) performs this function in IPv4.

Options

- *ip-address*—IP address of an NDP proxy.
- `to`—Specify the upper limit of the address range.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement modified in Junos OS Release 9.6.

address (Services)

IN THIS SECTION

- Syntax | 1927
- Hierarchy Level | 1927
- Description | 1927
- Required Privilege Level | 1927
- Release Information | 1927

Syntax

```
address ip-address;
```

Hierarchy Level

```
[edit services unified-access-control infranet-controller hostname]
```

Description

Specify the IP address of the IC Series device with which the SRX Series Firewalls should communicate.

This statement is required when you are configuring the SRX Series Firewall to act as a Junos OS Enforcer in a Unified Access Control (UAC) deployment. When deployed as a Junos OS Enforcer, the SRX Series Firewall enforces the policies that are defined on the UAC's IC Series device.

Required Privilege Level

services—To view this statement in the configuration.

services-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.4.

RELATED DOCUMENTATION

Acquiring User Role Information from an Active Directory Authentication Server

address (Services Dynamic Flow Capture)

IN THIS SECTION

- Syntax | 1928
- Hierarchy Level | 1928
- Description | 1928
- Options | 1928
- Required Privilege Level | 1928
- Release Information | 1929

Syntax

```
address address;
```

Hierarchy Level

```
[edit services dynamic-flow-capture capture-group client-name content-destination identifier]
```

Description

Configure an IP address for the flow capture destination.

Options

address—IP address for the content destination.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 7.4.

RELATED DOCUMENTATION

Configuring the Content Destination

address (Services NAT Pool)

IN THIS SECTION

- Syntax | 1929
- Hierarchy Level | 1929
- Description | 1929
- Options | 1930
- Required Privilege Level | 1930
- Release Information | 1930

Syntax

```
address ip-prefix</prefix-length>;
```

Hierarchy Level

```
[edit services nat pool nat-pool-name]
```

Description

Specify the NAT pool prefix value.

The subnet and broadcast addresses are not included in the list of usable IP addresses. For example, if you use 10.11.12.0/28 for the NAT pool prefix value, the addresses 10.11.12.0 (subnet address) and 10.11.12.15 (broadcast address) are not available.

Options

ip-prefix—Specify an IPv4 or IPv6 prefix value.

/prefix-length—(Optional) Specify an IPv4 or IPv6 prefix length.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

The *ip-prefix* and */prefix-length* options were enhanced to support IPv6 addresses in Junos OS Release 8.5.

RELATED DOCUMENTATION

Configuring Source and Destination Addresses Network Address Translation Overview

address-set

IN THIS SECTION

- Syntax | 1931
- Hierarchy Level | 1931
- Description | 1931
- Options | 1931
- Required Privilege Level | 1931

Release Information | 1932

Syntax

```
address-set address-set-name {
    address address-name;
    address-set address-set-name;
    description text;
}
```

Hierarchy Level

```
[edit security address-book book-name]
```

Description

Specify a collection of addresses, as defined in the `address (Address Book)` statement. Using address sets, you can organize addresses in logical groups and use them to easily configure other features, such as policies and NAT rules. Using this statement, you can also include a description for an address set.

You can also define address sets within address sets.

Options

address-set-name–Name of the address set.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5. Support for nested address sets introduced in Junos OS Release 11.2. The `description` option added in Junos OS Release 12.1.

address-shared (Security Source NAT)

IN THIS SECTION

- Syntax | 1932
- Hierarchy Level | 1932
- Description | 1932
- Required Privilege Level | 1933
- Release Information | 1933

Syntax

```
address-shared;
```

Hierarchy Level

```
[edit logical-systems name security nat source pool],
    [edit logical-systems name tenants name security nat source pool],
    [edit security nat source pool],
    [edit services nat source pool],
    [edit tenants name security nat source pool]
```

Description

Specifies that multiple internal IP addresses can be mapped to the same external IP address. Use this option only when the source NAT pool is configured with no port translation.

When a source NAT pool configured with no port translation has few external IP addresses available, or only one external IP address, the `address-shared` option, with a many-to-one mapping, increases NAT resources and improves traffic.

Required Privilege Level

security—To view this statement in the configuration

security-control—To add this statement to the configuration

Release Information

Statement introduced in Junos OS Release 12.1X45-D10.

[edit logical-systems logical-system-name routing-instances routing-instance-name protocols pim
rp static],
[edit protocols pim static],
[edit routing-instances routing-instance-name protocols pim rp static]
```

Description

Configure static rendezvous point (RP) addresses. You can configure a static RP in a logical system only if the logical system is not directly connected to a source.

For each static RP address, you can optionally specify the PIM version and the groups for which this address can be the RP. The default PIM version is version 1.

Options

address—Static RP address.

- **Default:** 224.0.0.0/4

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

```
[edit system services rest http] ,
[edit system services rest https]
```

Description

Specify IP addresses for incoming connections.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.2.

adf (Dynamic Firewalls)

IN THIS SECTION

- Syntax | 1940
- Hierarchy Level | 1940
- Description | 1940
- Options | 1940
- Required Privilege Level | 1941
- Release Information | 1941

Syntax

```
adf {
    counter;
    input-precedence precedence;
    not-mandatory;
    output-precedence precedence;
    rule rule-value;
}
```

Hierarchy Level

```
[edit dynamic-profiles profile-name interfaces interface-name unit logical-unit-number family
family filter]
```

Description

Configure an Ascend-Data-Filter that the dynamic profile applies to a subscriber session.

Options

`counter`—Enable a counter that increments each time the Ascend-Data-Filter rule is used. Typically used for testing purposes.

`not-mandatory`—Suppress router from reporting an error when the RADIUS reply message does not include the $junos-adf-rule-v4 or $junos-adf-rule-v6 variable that is configured for the Ascend-Data-Filter in the dynamic profile. In this circumstance, the Ascend-Data-Filter is not created.

`precedence`—Precedence value that sets the order in which dynamic service filters are applied on the interface. The lower the precedence value, the higher the precedence that is given. The precedence setting is used in conjunction with the precedence settings of all dynamic service filters configured (not only Ascend-Data-Filters) on the same interface to establish the order. For example, the order also includes any configured `input` *`filter-name`* `precedence` *`precedence`* and `output` *`filter-name`* `precedence` *`precedence`* statements.

- **Range:** 0 through 255
- **Default:** 0

`rule-value`—Ascend-Data-Filter rule. You can specify either a Junos predefined variable that maps the Ascend-Data-Filter actions to Junos filter functionality or you can manually configure the Ascend-Data-

Filter rule. The router supports two predefined variables depending on family type: `$junos-adf-rule-v4` for family `inet` and `$junos-adf-rule-v6` for family `inet6`.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.4.

Option `not-mandatory` introduced in Junos OS Release 12.2.

- Release Information | 1954

Syntax

```
adjust-threshold percent;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols mpls label-switched-path lsp-name auto-
bandwidth],
[edit protocols mpls label-switched-path lsp-name auto-bandwidth]
```

Description

Specify in percentage how sensitive the automatic bandwidth adjustment for a label-switched path (LSP) is to changes in bandwidth utilization.

To specify the changes in the automatic bandwidth adjustment for a LSP in absolute value, use the "adjust-threshold-absolute" on page 1954 statement instead.

Options

percent—Bandwidth demand for the current bandwidth adjustment interval is determined and compared to the LSP's current bandwidth allocation. If the percentage difference in bandwidth is greater than or equal to the percentage specified by this statement, the LSP's bandwidth is adjusted to the current bandwidth demand.

Required Privilege Level

routing—To view this statement in the configuration.

bandwidth],
[edit protocols mpls label-switched-path name auto-bandwidth],
[edit routing-instances name protocols mpls label-switched-path name auto-bandwidth]
```

Description

Specify in bits per second how sensitive the automatic bandwidth adjustment for a label-switched path (LSP) is to changes in the average LSP utilization.

The `adjust-threshold-absolute` statement works in conjunction with the `adjust-threshold` statement, which specifies the change in automatic bandwidth adjustment for an LSP as a percentage.

By triggering automatic bandwidth LSP resignaling based on absolute change in bandwidth instead of percentage bandwidth change, LSP resignaling can be optimized for both big and small LSPs at the same time.

Options

bps Change in average LSP utilization to trigger automatic bandwidth adjustment in bits per second.

- **Default:** 0 bps

Required Privilege Level

routing

Release Information

Statement introduced before Junos OS Release 17.4R1.

[edit security utm feature-profile anti-virus kaspersky-lab-engine pattern-update email-notify]
[edit security utm feature-profile anti-virus sophos-engine pattern-update email-notify]
[edit security utm default-configuration anti-virus avira-engine pattern-update email-notify]
```

Description

You can configure the device to notify a specified administrator when patterns are updated. This is an e-mail notification with a custom message and a custom subject line.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

The Express and Kaspersky antivirus feature is not supported from Junos OS Release 15.1X49-D10 onwards. For previous releases, statement introduced in Junos OS Release 9.5.

The `[edit security utm default-configuration]` hierarchy level is introduced in Junos OS Release 18.2R1.

Support for Avira engine added in Junos OS Release 18.4R1.

admin-group (Backup Selection)

IN THIS SECTION

- Syntax | 1965
- Hierarchy Level | 1965
- Description | 1965
- Options | 1966
- Required Privilege Level | 1966
- Release Information | 1966

Syntax

```
admin-group {
    exclude [ group-name ];
    include-all [ group-name ];
    include-any [ group-name ];
    preference [ group-name ];
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-options backup-selection destination prefix
interface interface name],
[edit logical-systems logical-system-name routing-instances instance-name routing-options backup-
selection destination prefix interface interface-name],
[edit routing-instances instance-name routing-options backup-selection destination prefix
interface interface-name],
[edit routing-options backup-selection destination prefix interface interface name]
```

Description

Define the administrative groups criteria for the selection of the backup path.

NOTE: Configure group names of admin-group under the [`edit protocols mpls`] hierarchy level.

Options

exclude [*group-name*]

Specify the administrative groups to be excluded. The backup path is not selected as the loop-free alternate (LFA) or backup next hop if any of the links in the path have any one of the listed administrative groups.

group-name Name of one or more admin-group defined under the [`edit protocols mpls`] hierarchy level.

include-all [*group-name*]

Require each link in the backup path to have all the listed administrative groups in order to accept the path.

group-name Name of one or more admin-group defined under the [`edit protocols mpls`] hierarchy level.

include-any [*group-name*]

Require each link in the backup path to have at least one of the listed administrative groups in order to select the path.

group-name Name of one or more admin-group defined under the [`edit protocols mpls`] hierarchy level.

preference [*group-name*]

Define an ordered set of administrative groups that specifies the preference of the backup path. The leftmost element in the set is given the highest preference.

group-name Name of one or more admin-group defined under the [`edit protocols mpls`] hierarchy level.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.1.

protection bypass bypass-name],
```

```
[edit protocols rsvp interface interface-name link-protection],
[edit protocols rsvp interface interface-name link-protection bypass bypass-name]
```

Description

Enable you to configure administrative groups for bypass label-switched paths (LSPs). You can configure administrative groups either globally for all bypass LSPs traversing an interface or for just a specific bypass LSP.

Options

`exclude` *`group-names`*—Specify the administrative groups to exclude for a bypass LSP.

`include-all` *`group-names`*—Specify the administrative groups whose links the bypass LSP must traverse.

`include-any` *`group-names`*—Specify the administrative groups whose links the bypass LSP can traverse.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.2.

| secondary) path-name],
[edit protocols mpls],
[edit protocols mpls label-switched-path lsp-name],
[edit protocols mpls label-switched-path lsp-name (primary | secondary) path-name]
```

Description

Specifies the group name and group identifier for an administrative group. The group identifier must be within the range of values specified by the `admin-groups-extended-range` statement. The extended administrative group values are global and must be identically configured on all the supported routers participating in the network. The domain-wide extended administrative groups database, learned from other routers through IGP flooding, is used by CSPF for path computation.

Options

apply-groups Apply the specified administrative groups for the LSP or for the primary and secondary paths.

apply-groups-except Exclude the specified administrative groups from the LSP or from the primary and secondary paths.

exclude Define the administrative groups to exclude from an LSP or from the primary and secondary paths.

include-all Require the LSP to traverse links that include all of the defined administrative groups.

include-any Define the administrative groups to include for an LSP for the primary and secondary paths.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.1.

    maximum maximum-number;
    mininum minimum-number;
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-options],
[edit routing-options]
```

Description

Enables you to configure extended administrative groups, represented by a 32-bit value, expanding the number of administrative groups supported in the network beyond just 32. In MPLS traffic engineering, a link can be configured with a set of administrative groups (also known as colors or resource classes). Administrative groups are carried in IGPs (OSPFv2 and IS-IS) as a 32-bit value assigned to each link. By default, Juniper Networks routers interpret this 32-bit value as a bit mask with each bit representing a group. This normally limits each network to a total of 32 distinct administrative groups (value range 0 through 31).

The extended administrative groups configuration accepts a set of interfaces with a corresponding set of extended administrative group names. It converts the names into a set of 32-bit values and propagates this information into the IGP. The extended administrative group values are global and must be identically configured on all the supported routers participating in the network. The domain-wide extended administrative groups database, learned from other routers through IGP flooding, is used by CSPF for path computation.

Options

maximum *maximum-number*	The range of configurable values is between 32 and 4,294,967,295. The range maximum must be greater than the range minimum.
minimum *minimum-number*	The range of configurable values is between 32 and 4,294,967,295. The range maximum must be greater than the range minimum.

adsl-bytes

IN THIS SECTION

- Syntax | 1983
- Hierarchy Level | 1983
- Description | 1983
- Options | 1983
- Required Privilege Level | 1983
- Release Information | 1983

Syntax

```
adsl-bytes bytes;
```

Hierarchy Level

```
[edit protocols ancp qos-adjust]
```

Description

Adjust the number of cell overhead bytes by the specified number of bytes in the actual downstream rate reported in the ANCP Port Up message for an ADSL access line. The ANCP agent reports the adjusted value to CoS. The adjusted value accounts for the traffic encapsulation overhead.

NOTE: Starting in Junos OS Release 17.4R1, this statement is deprecated and replaced by the `adsl-overhead-bytes` option of the `access-line` statement at the `[edit system]` hierarchy level. The ANCP agent ignores the `adsl-bytes` statement if it is present. This means that when you upgrade from Junos OS Release 17.3 or earlier with an existing configuration, you must reconfigure your adjustment with the `access-line` statement.

Options

bytes Number of bytes added to or subtracted from the actual downstream cell overhead.

- **Range:** -100 through 100 bytes
- **Default:** 0 bytes

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.2.

Statement deprecated in Junos OS Release 17.4R1.

Hierarchy Level

[edit security]

Description

Configure an advanced policy-based routing.

You can create an advanced policy-based routing (APBR) profile (application profile) to match applications and application groups and redirect those matching traffic to the specified routing instance for the route lookup. The profile includes multiple rules. Each rule can contain multiple applications or application groups. If the application matches any of the application or application groups of a rule in a profile, the application profile rule is considered to be a match.

The APBR profile evaluates the application-aware traffic and permits or denies traffic based on the applications and application groups.

The application profile can be attached to a security zone or it can be attached to a specific logical or physical interface associated with the security zone.

Options

profile *profile-name*	Name of the profile. Must be a unique name with a maximum length of 63 characters.
from-zone	Specify a source zone to be associated with the APBR policy.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

services—To view this statement in the configuration.

services-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1X49-D60.

- Release Information | 1994

Syntax

```
advance-policy-based-routing-profile profile;
```

Hierarchy Level

[edit security zones security-zone *zone-name*]

Description

Enable Advance Policy Based Routing on the specified security zone.

To classify and redirect the traffic, the APBR profile matches applications and application groups and if the matching rule is found, the packets are routed to the routing instance that sends the traffic to a different interface as specified in the next-hop IP address. So, you must associate the application profile to the ingress traffic—that is, attach the application profile to a security zone.

When the application profile is applied to a security zone, then all interfaces belonging to that zone are attached to the application profile by default unless there is a specific configuration for an interface belonging to that zone.

Required Privilege Level

services—To view this statement in the configuration.

services-control—To add this statement to the configuration.

advanced-anti-malware connection

IN THIS SECTION

- Syntax | **1995**
- Description | **1995**
- Options | **1996**
- Required Privilege Level | **1996**

- Output Fields | 1996
- Sample Output | 1996
- Release Information | 1996

Syntax

```
set services advanced-anti-malware connection (authentication | source-address | source-
interface | url)
```

Description

Configures the cloud connection, including the hostname, port number and authentication information. Once configured, a certificate-based mutual authentication and TLS connection is established between the SRX Series Firewall and Juniper ATP Cloud. The SRX Series Firewall receives configurations from the cloud and sends health data back to the cloud.

You can also use the op script to perform the same operations as the `set services advanced-anti-malware connection` command. To download the Junos op script, see Download and Run the Juniper ATP Cloud Script.

For SRX300, SRX320, SRX340, SRX345 and SRX500 Series Firewalls, you must run the `set security forwarding-process enhanced-services-mode` command before running the op script or before running the `set services advanced-anti-malware connection` command. For example:

```
user@host> set security forwarding-process enhanced-services-mode
user@host> set services advanced-anti-malware connection url https://xxx.xxxx.junipersecurity.net
user@host> set services advanced-anti-malware connection authentication tls-profile aamw-ssl
```

We recommend that you use the op script instead of using the `set services advanced-anti-malware connection` command.

Use the `show services advanced-anti-malware status` CLI command to verify that connection is made to the cloud server from the SRX Series Firewall. If you do not see entries, we recommend you rerun the op script.

Options

authentication tls-profile ***profile-name***	Name of the TLS profile that contains settings for the TLS-secured connection.
source-address ***address***	The source IP address to send files to the cloud.
source-interface ***interface***	The source interface to send files to the cloud. If you configure the `source-interface` but not the `source-address`, the SRX Series Firewall uses the IP address from the specified interface for connections.
url ***url***	The URL of the cloud. You can optionally specify a port if needed. For example, `https://www.juniper-threat-prevent-cloud.net:443`.

Required Privilege Level

View

Output Fields

This command produces no output.

Sample Output

set services advanced-anti-malware connection url

```
user@host# set services advanced-anti-malware connection url https://sky.junipersecurity.net
```

set services advanced-anti-malware connection authentication

```
user@host# set services advanced-anti-malware connection authentication tls-profile aamw-ssl
```

Release Information

Command introduced in Junos OS Release 15.1X49-D33.

[edit services advanced-anti-malware]
```

Description

The connection to the Juniper Advanced Threat Prevention Cloud is launched on-demand. It is established only when a condition is met and a file or URL must be sent to the cloud. The cloud inspects the file and returns a verdict number (1 through 10). A verdict number is a score or threat level. The higher the number, the higher the malware threat. The SRX Series Firewall compares this verdict number to the Juniper Advanced Threat Prevention Cloud policy settings and either permits or denies the session. If the session is denied, a reset packet is sent to the client and the packets are dropped from the server.

Juniper Advanced Threat Prevention Cloud policies append to the Junos OS security policies by defining the actions to take when a file is considered malware or when an attempt is made to download a file from a location that's on a custom blocklist or allowlist.

Use this command to configure the Juniper Advanced Threat Prevention Cloud policy.

Options

policy-name Name of the Juniper Advanced Threat Prevention Cloud policy.

> **NOTE**: Starting in Junos OS Release 18.2R1, for unified policies, a `default-policy` can be used for anti-malware and security-intelligence policies. The commands are: `set services security-intelligence default-policy` and `set services advanced-anti-malware default-policy`. During the initial policy lookup phase, which occurs prior to a dynamic application being identified, if there are multiple policies present in the potential policy list which contains different security intelligence or anti-malware policies, the SRX Series Firewall applies the default policy until a more explicit match has occurred. See the *Juniper ATP Cloud Administration Guide* and your SRX Series documentation for more details on unified policies.

blacklist-notification (Optional) Create a system log entry when an attempt to access a website listed in the blocklist file is made. Use `blacklist-notification log` to create a log entry. If you do not want to create a log entry, do not specify the `blacklist-notification` option.

default-notification Create a system log entry if the cloud returns a verdict number less than the *verdict-threshold*. Use `default-notification log` to create a log entry. If you do not want to create a log entry, do not specify the `default-notification` option.

fallback-options (action block | action permit) The action to take when the SRX Series Firewall runs out of resources or the connection to the cloud is lost. The default is `action permit`.

fallback-options (Optional) Create a system log entry when fallback occurs. Use `fallback-options notification log` to create a log entry. If you do not want to create a log entry, do not specify the `fallback-options notification` option.

http This command allows you to inspect advanced anti-malware (AAMW) files downloaded by hosts through Hypertext Transfer Protocol (HTTP) protocol. The AAMW files are then submitted to Juniper ATP Cloud for malware screening.

http action (permit | block) This command allows you to permit or block malware based on the detected malware.

Starting in Junos OS release 21.3R1, when the http action is set as block, the detected malware file will be blocked immediately after signature match. Juniper ATP cloud will not get the full file for analysis, instead it will receive a notification of the malware hit event. You can view the malware information Juniper ATP Cloud Portal. The Partial file

tab displays the malware hit event information for all blocked signature match detections.

http(s) client-notify (message | file | redirect-url)

(Starting in Junos OS release 19.3R1) This command allows you to configure HTTP URL redirection for a customized client notification based on detected malware with the block action.

http(s) file-verdict-unknown (permit | block)

(Starting in Junos 19.3R1) This command allows you to permit or block malware based on the detected malware having a verdict of “unknown.” By default, “unknown” malware is permitted.

smb

(Starting in Junos 21.1R1) This command allows you to inspect advanced anti-malware (AAMW) files downloaded by hosts through Server Message Block (SMB) protocol. The AAMW files are then submitted to Juniper ATP Cloud for malware screening.

> **NOTE**:
>
> - Starting in Junos OS Release 21.3R1, SMB supports block mode in addition to permit mode.
> - SMBv3 encryption is not supported.
> - SMB multichannel is not supported.

inspection-profile

Name of the Juniper Advanced Threat Prevention Cloud profile. This profile defines what file types or file categories are to be sent to the cloud for inspection.

match *verdict-threshold*

The *verdict-threshold* defines the number at which you want to label a file as malware. For example, if you set *verdict-threshold* to 7 and the cloud returns a verdict number of 7 or greater, then that file is considered malware. *verdict-threshold* can be any number between 1 and 10, inclusive.

then notification

(Optional) Create a system log entry if the cloud returns a verdict number equal to or greater than the *verdict-threshold*. Use `then notification log` to create a log entry. If you do not want to create a log entry, do not specify the `then notification` option.

whitelist-notification

(Optional) Create a system log entry when an attempt to access a website listed in the allowlist file is made. Use `whitelist-notification log` to create a log entry. If you do not want to create a log entry, do not specify the `whitelist-notification` option.

Table 1 on page 2002 shows examples of using the Juniper Advanced Threat Prevention Cloud policy options.

Table 1: Juniper Advanced Threat Prevention Cloud Security Policy Additions

Addition	Description

Action and notification based on the verdict number and threshold	Defines the threshold value and what to do when the verdict number is greater than or equal to the threshold. For example, if the threshold is 7 and Juniper Advanced Threat Prevention Cloud returns a verdict number of 9 for a file, then that file is blocked from being downloaded and a log entry is created.
	
	`set services advanced-anti-malware policy aamwpol1 match verdict-threshold 7`
	`set services advanced-anti-malware policy aamwpol1 then action block`
	`set services advanced-anti-malware policy aamwpol1 then notification log`

Default action and notification	Defines what to do when the verdict number is less than the threshold. For example, if the threshold is 7 and Juniper Advanced Threat Prevention Cloud returns a verdict number of 3 for a file, then that file is allowed to be downloaded and create a log entry. `set services advanced-anti-malware policy aamwpol1 default-notification log`
Name of the inspection profile	Name of the Juniper Advanced Threat Prevention Cloud profile that defines the types of file to scan. `set services advanced-anti-malware policy aamwpol1  inspection-profile profile1`

Table 1: Juniper Advanced Threat Prevention Cloud Security Policy Additions *(Continued)*

Addition	Description

Fallback options	Defines what to do when error conditions occur or when there is a lack of resources. The following fallback options are available:
	• action—Permit or block the file regardless of its threat level.
	• notification—Add or do not add this event to the log file.
	
	`set services advanced-anti-malware policy aamwpol1 fallback-options action block`
	`set services advanced-anti-malware policy aamwpol1 fallback-options notification log`
	
	The following fallback options are available:
	• invalid-content-size—Content size exceed supported range
	• out-of-resources—Service is out of resources
	• service-not-ready—Service is not yet ready
	• submission-timeout—Submission is timed out
	• unknown-file—File type is unknown
	• verdict-timeout—Verdict is timed out
	
	If none of listed fallback condition is hit, then the default fallback option is applied.

Blocklist notification	Defines whether to create a log entry when attempting to download a file from a site listed in the blocklist file. `set services advanced-anti-malware policy aamwpol1 blacklist-notification log`
Whitelist notification	Defines whether to create a log entry when attempting to download a file from a site listed in the allowlist file. `set services advanced-anti-malware policy aamwpol1 whitelist-notification log`

Table 1: Juniper Advanced Threat Prevention Cloud Security Policy Additions *(Continued)*

Addition	Description

User notification of malware on block action	(Starting in Junos 19.3R1) This command allows you to configure HTTP and HTTPS URL redirection for a customized client notification based on detected malware with the block action. A block message can only be sent when a block action is configured.
	
	NOTE: See "request services advanced-anti-malware redirect-file" on page 14910 for details on adding a custom file.
	
	`set services advanced-anti-malware policy p1 http client-notify message`
	`set services advanced-anti-malware policy p1 http client-notify file`
	`set services advanced-anti-malware policy p1 http client-notify redirect-url <enter URL>`

Block or permit malware when file verdict is “unknown”	(Starting in Junos 19.3R1) This command allows you to permit or block malware based on the detected file having a verdict of “unknown.” By default, an “unknown” file verdict is permitted. (Note this only applies to HTTP and HTTPS traffic.) `set services advanced-anti-malware policy p1 http file-verdict-unknown <block|permit>`

advanced-anti-malware traceoptions

IN THIS SECTION

- Syntax | 2005
- Description | 2005
- Options | 2005
- Required Privilege Level | 2007
- Output Fields | 2007
- Release Information | 2007

Syntax

```
set services advanced-anti-malware traceoptions
    <apply-groups name>
     <apply-groups-except name>
    <file (trace-file-name | files | match | no-world-readable | size | world-readable)>
    <flag (all | connection | content | daemon | identification | parser | plugin | policy)>
    <level level>
    <no-remote-trace>
```

Description

In Junos, the concept of setting traceoptions requires setting the trace in the configuration itself, rather than as an operational mode command. When the trace is set in the configuration, the “flags” are defined for the actual debug that you want to perform. This command allows you to trace the Juniper Advanced Threat Prevention Cloud configuration and is typically used for troubleshooting.

Options

apply-groups *name*	Groups that these trace option settings apply.
apply-groups-	Groups that these trace option settings do not apply.

except *name*

file Defines the trace file characteristics. Valid options are:

- *trace-file-name*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory /var/log. Valid values range from 1 and 1024 characters. The name cannot include spaces, /, or % characters. The default filename is security.
- files—Maximum number of trace files that can accumulate. Valid values range from 2 to 1000. The default value is 3.
- match—The criteria that you want the system to use when logging information to the file. You can enter a regular expression. Wildcard (*) characters are accepted.
- no-world-readable—Only the system administrator can read the trace file.
- size—Maximum size to which the trace file can grow. Once the file reaches the specified size, it is compressed and renamed *filename*0.gz, the next file is named *filename*1.gz, and so on. Valid values range from 10240 to 1,073,741,824.
- world-readable—Any user can read the trace file.

flag *flag* Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:

- all—Trace everything.
- connection—Trace connection to the Juniper Advanced Threat Prevention Cloud server.
- content—Trace the content the SRX is buffering to the client and to the cloud.
- daemon—Trace the Juniper Advanced Threat Prevention Cloud daemon.
- identification—Trace the file type identification. Examples of file types are .exes, .java, .tar and so forth.
- parser—Trace the interface between the Juniper Advanced Threat Prevention Cloud daemon and the module that parses the HTTP protocol and extracts the file content..
- plugin—Trace the Juniper Advanced Threat Prevention Cloud plugin to view session checks, packet processing and actions taken against a file or URL.
- policy—Trace the Juniper Advanced Threat Prevention Cloud security policy.

level *level* Specify level of tracing to perform. The option you configure enables tracing of events at that level and all higher (more restrictive) levels. You can specify any of the following levels:

- `all`—Match messages of all levels.
- `error`—Match error conditions.
- `info`—Match informational messages.
- `notice`—Match notice messages about conditions requiring special handling.
- `verbose`—Match verbose messages. This is the lowest (least restrictive) severity level; when you configure `verbose`, messages at all higher levels are traced. Therefore, the result is the same as when you configure `all`.
- `warning`—Match warning messages.

`no-remote-trace` Disable remote tracing.

Required Privilege Level

`trace`—To view this statement in the configuration.

`trace-control`—To add this statement to the configuration.

Output Fields

This command produces no output. Use the `show log` *`trace-file-name`* command to view the debug file.

Release Information

Command introduced in Junos OS Release 15.1X49-D33.

advertise

IN THIS SECTION

- Syntax | 2008
- Hierarchy Level | 2008
- Description | 2008

[edit logical-systems logical-system-name protocols bgp group group-name neighbor address],
[edit protocols bgp],
[edit protocols bgp group group-name],
[edit protocols bgp group group-name neighbor address]
```

Description

Include this statement to always advertise a BGP-static route, even if it is not the active route for a prefix. You can configure this statement globally to advertise the BGP-static routes to all neighbors. You can also configure this statement to advertise BGP-static routes in a BGP group or to a specific neighbor in a BGP group.

Options

`policy` ***policy-expression*** Specify an additional export policy to control whether or not a given BGP-static route is to be advertised in preference to the active route for a prefix. The policy is applied to the BGP-static route and not to the active route. Only the accept or reject result of the policy expression is observed, and any side-effects, such as, modifying communities, are ignored.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.2.

[edit routing-instances routing-instance-name protocols bgp group group-name neighbor neighbor-
address]
```

Description

Specify BGP to advertise the best external route into an IBGP mesh group, a route reflector cluster, or an AS confederation even if the best route is an internal route.

In general, deployed BGP implementations do not advertise the external route with the highest local preference value to internal peers unless it is the best route. Although this behavior was required by an earlier version of the BGP version 4 specification, RFC 1771, it was typically not followed in order to minimize the amount of advertised information and to prevent routing loops. However, there are scenarios in which advertising the best external route is beneficial, in particular, situations that can result in IBGP route oscillation.

The `advertise-external` statement is supported at both the group and neighbor level. If you configure the statement at the neighbor level, you must configure it for all neighbors in a group. Otherwise, the group is automatically split into different groups.

In a confederation, when advertising a route to a confederation border router, any route from a different confederation sub-AS is considered external. When configuring the `advertise-external` statement for an AS confederation, it is recommended that EBGP peers belonging to different autonomous systems are configured in a separate EBGP peer group. This ensures consistency while BGP sends the best external route to peers in the configured peer group.

To configure the `advertise-external` statement on a route reflector, you must disable intracluster reflection with the `no-client-reflect` statement.

When a routing device is configured as a route reflector for a cluster, a route advertised by the route reflector is considered internal if it is received from an internal peer with the same cluster identifier or if both peers have no cluster identifier configured. A route received from an internal peer that belongs to another cluster, that is, with a different cluster identifier, is considered external.

The `conditional` option causes BGP to advertise the external route only if the route selection process reaches the point where the multiple exit discriminator (MED) metric is evaluated. As a result, an external route with an AS path longer than that of the active path is not advertised.

Junos OS also provides support for configuring a BGP export policy that matches on the state of an advertised route. You can match on either active or inactive routes.

Default

BGP does not advertise the external route with the highest local preference value to internal peers unless it is the best route.

Options

`conditional`—(Optional) Advertise the best external path only if the route selection process reaches the point at which the multiple exit discriminator (MED) metric is evaluated. The `conditional` option restricts advertisement to when the best external path and the active path are equal until the MED step of the route selection process. This implies that external routes with a longer AS path length than the active

path, for instance, are not advertised. The criteria used for selecting the best external path is the same whether or not the `conditional` option is configured.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.3.

advertise-from-main-vpn-tables

IN THIS SECTION

- Syntax | 2013
- Hierarchy Level | 2014
- Description | 2014
- Default | 2014
- Required Privilege Level | 2014
- Release Information | 2014

Syntax

```
advertise-from-main-vpn-tables;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols bgp],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols bgp],
[edit protocols bgp],
[edit routing-instances routing-instance-name protocols bgp]
```

Description

Advertise VPN routes from the main VPN tables in the master routing instance (for example, bgp.l3vpn.0, bgp.mvpn.0) instead of advertising VPN routes from the tables in the VPN routing instances (for example, *instance-name*.inet.0, *instance-name*.mvpn.0). Enable nonstop active routing (NSR) support for BGP multicast VPN (MVPN).

When this statement is enabled, before advertising a route for a VPN prefix, the path selection algorithm is run on all routes (local and received) that have the same route distinguisher (RD).

> **NOTE**: Adding or removing this statement causes all BGP sessions that have VPN address families to be removed and then added again. On the other hand, having this statement in the configuration prevents BGP sessions from going down when route reflector (RR) or autonomous system border router (ASBR) functionality is enabled or disabled on a routing device that has VPN address families configured.

Default

If you do not include this statement, VPN routes are advertised from the tables in the VPN routing instances.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3.

```

Description

Configure the routing table to export to BGP the best route learned by BGP even if Junos OS did not select this route to be an active route.

One way to achieve multivendor compatibility is to include the `advertise-inactive` statement in the external BGP (EBGP) configuration. By default, BGP stores the route information it receives from update messages in the Junos OS routing table, and the routing table exports only active routes into BGP, which BGP then advertises to its peers. The `advertise-inactive` statement causes Junos OS to advertise the best BGP route that is inactive because of IGP preference. When you use the `advertise-inactive` statement, the Junos OS device uses, for example, the OSPF route for forwarding, and the other vendor's device uses the EBGP route for forwarding. However, from the perspective of an EBGP peer in a neighboring AS, both vendors' devices appear to behave the same way.

NOTE: When BGP advertises a network layer reachability information (NLRI) with a label, and the advertised route resides in xxx.xxx.3 routing table such as inet.3, Junos OS automatically advertises such inactive routes even if you have not configured the `advertise-inactive` statement.

NOTE: The `advertise-inactive` statement does not help to advertise the inactive route from the VRF when the router is configured as a route reflector.

Default

By default, BGP stores the route information it receives from update messages in the Junos OS routing table, and the routing table exports only active routes into BGP, which BGP then advertises to its peers.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

protection context-identifier context-id],
[edit protocols mpls egress-protection context-identifier context-id],
[edit protocols mpls label-switched-path lsp-name egress-protection context-identifier context-
id]
```

Description

Configure the method for the interior gateway protocol (IGP) to advertise egress protection availability.

Egress protection availability is advertised in the IGP. Label protocols along with CSPF use this information to do egress protection.

Options

stub-alias Context identifier has an alias.

In the alias method, the LSP end-point address has an explicit backup egress node where the backup node can be learned or configured on the penultimate hop node (PHN) of a protected LSP. With this model, the PHN of a protected LSP sets up the bypass LSP tunnel to back up the

egress node by avoiding the primary egress node. This model requires a Junos OS upgrade in core nodes, but is flexible enough to support all traffic engineering constraints.

stub-proxy Context-identifier has a stub proxy node.

A stub node is one that only appears at the end of an AS path, which means it does not provide transit service. In this mode, known as the virtual or proxy mode, the LSP end-point address is represented as a node with bidirectional links, with the LSP's primary egress node and backup egress node. With this representation, the penultimate hop of the LSP primary egress point can behave like a PLR in setting up a bypass tunnel to back up the egress by avoiding the primary egress node. This model has the advantage that you do not need to upgrade Junos OS on core nodes and thereby helps operators to deploy this technology.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

```

Description

Disable the default behavior of suppressing AS routes.

If you include the `advertise-peer-as` statement in the configuration, BGP advertises routes learned from one external BGP (EBGP) peer back to another EBGP peer in the same autonomous system (AS) but not back to the originating peer.

Another way to disable the route suppression default behavior is with the `as-override` statement. If you include both the `as-override` and `no-advertise-peer-as` statements in the configuration, the `no-advertise-peer-as` statement is ignored.

Default

By default, Junos OS does not advertise the routes learned from one EBGP peer back to the same external BGP (EBGP) peer. In addition, the software does not advertise those routes back to any EBGP peers that are in the same AS as the originating peer, regardless of the routing instance.

Description

Enable the egress BGP peer to advertise SRv6 service to a remote provider edge (PE) device. BGP advertises the reachability of prefixes of a particular service from an egress PE device to ingress PE nodes through BGP messages. BGP egress nodes advertise a set of reachable prefixes when you enable BGP Layer 3 services over the SRv6 data plane.

```

Description

Enable the BGP long-lived graceful restart (LLGR) stale routes to be advertised to neighbors that do not advertise the LLGR capability. This setting applies to both routes that were marked LLGR-stale by this router, and LLGR-stale routes received from neighbors. Ideally, all routers in an autonomous system support the IETF draft specification before it was enabled. However, to facilitate incremental deployment, stale routes might be required to be advertised to neighbors that have not advertised the long-lived graceful restart capability under the following conditions: The neighbors must be internal (IBGP or Confederation) neighbors. The NO_EXPORT community must be attached to the stale routes. The stale routes must have their LOCAL_PREF attribute set to zero. If this technique for partial deployment is used, you must set LOCAL_PREF to zero for all LLGR routes throughout the autonomous system. This configuration trades off a small reduction in flexibility (ordering may not be preserved between competing LLGR routes) for consistency between routers that support and do not support this specification. Because consistency of route selection can be important for preventing forwarding loops, the latter consideration of routers that do not support this specification precedes.

Options

The remaining statement is explained separately. See CLI Explorer.

Required Privilege Level

advertise-zero-ethernet-tag

IN THIS SECTION

- Syntax | 2028
- Hierarchy Level | 2028
- Description | 2028
- Required Privilege Level | 2029
- Release Information | 2029

Syntax

```
advertise-zero-ethernet-tag;
```

Hierarchy Level

```
[edit routing-instances name protocols evpn]
```

Description

Advertise EVPN Type 2 (MAC/IP Advertisement) and EVPN Type 3 (Inclusive Multicast Ethernet Tag) routes with an Ethernet Tag ID value of 0. This statement only applies to `instance-type` EVPN routing instances and must have a valid `vlan-id` and `no-normalization` configured.

You use the `advertise-zero-ethernet-tag` configuration statement when you need a vlan-based service with a valid `vlan-id` providing Layer 3 gateway functionality while also providing RFC 7432 compliance for Layer 2 gateway functionality with control plane EVPN routes advertised with an Ethernet Tag ID value of 0.

The following is an excerpt from a sample configuration:

```
user@mx960> show configuration routing-instances evpna
instance-type evpn;
protocols {
    evpn {
            advertise-zero-ethernet-tag;
    }
}
vlan-id 600;
routing-interface irb.600;
no-normalization;
interface ge-0/0/1.600;
route-distinguisher 1:1;
vrf-target target:1:1;
```

NOTE: The `mod` based `df-election-type` uses the `vlan-id` in the designated forwarder (DF) calculation. This can cause an inconsistency in the DF election when one provider edge (PE) device is configured with `vlan-id none` and the other is configured with a valid `vlan-id`. Therefore, we recommend having the same `vlan-id` configuration under the EVPN routing instance to ensure a consistent DF election.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

- Release Information | 2038

Syntax

```
advpn {
    suggester {
        disable;
    }
    partner {
        connection-limit number;
        idle-threshold   packets/sec;
        idle-time        seconds;
        disable;
    }
}
```

Hierarchy Level

```
[edit security ike gateway gateway-name]
```

Description

Enable Auto Discovery VPN (ADVPN) protocol on the specified gateway. ADVPN dynamically establishes VPN tunnels between spokes to avoid routing traffic through the Hub. When you enable ADVPN, by default, the Junos OS enables both the suggester and partner roles on the device. You cannot use the same device with both the functions together. To use a specific role, you must explicitly disable the other.

Options

suggester VPN peer that can initiate a shortcut exchange to allow shortcut partners to establish dynamic security associations (SAs) with each other. Specify `disable` to disable this role on the gateway.

Both suggester and partner roles are enabled if `advpn` is configured without explicitly configuring `suggester` or `partner` keywords. We do not support suggester and partner roles on the same gateway. You must explicitly configure `disable` with the `suggester` or `partner` keyword to disable that particular role. You cannot disable both suggester and partner roles on the same gateway.

partner VPN peer that can receive a shortcut exchange suggesting that it should establish dynamic SAs with another peer. Specify `disable` to disable this role on the gateway.

The following options can be configured for the partner role:

connection-limit Maximum number of shortcut tunnels that can be created with different shortcut partners using a particular gateway. The maximum number, which is also the default, is platform-dependent.

Reducing the configured `connection-limit` value causes all active shortcut tunnels to be brought down. For example, if `connection-limit` is configured as 100 and you later reconfigure the number to 80, all active shortcut tunnels are brought down. Increasing the configured `connection-limit` value does not cause shortcut tunnels to go down.

idle-threshold Rate, in packets per second, below which the shortcut is brought down.

- **Range:** 3 through 5,000 packets per second.
- **Default:** 5 packets per second.

idle-time Duration, in seconds, after which the shortcut is deleted if the traffic remains below the `idle-threshold` value.

- **Range:** 60 seconds through 86,400 seconds.
- **Default:** 300 seconds.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3X48-D10. The range for the `idle-threshold` option and the range and default value for the `idle-time` option revised in Junos OS Release 12.3X48-D20.

Support for ADVPN with the iked process is added in Junos OS Release 23.4R1.

af-mode

IN THIS SECTION

- Syntax | 2039
- Hierarchy Level | 2039
- Description | 2039
- Default | 2039
- Required Privilege Level | 2040
- Release Information | 2040

Syntax

```
af-mode;
```

Hierarchy Level

```
[edit poe interface (all | interface-name)]
```

Description

Configure a PoE port on an EX6200 switch to support IEEE 802.3af only. The maximum power the port can deliver in either class or static mode is 15.4 W.

Default

PoE ports on an EX6200 switch support IEEE 802.3at (PoE+) by default.

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.3.

- Options | 2041
- Required Privilege Level | 2041
- Release Information | 2041

Syntax

```
af-name {
    peer-gnf {
        id peer-gnf-id;
        remote-af-name;
    }
    description af-description;
}
```

Hierarchy Level

```
[edit chassis network-slices guest-network-functions gnf id]
```

Description

Configure abstracted fabric (af) interface between a pair of guest network functions (GNFs). Abstracted fabric interface is a pseudo interface that represents a first class Ethernet interface behavior. An af interface is created on a GNF to communicate with the peer GNF when the two GNFs are connected to each other through the CLI.

NOTE: Only one af interface can be configured between a pair of GNFs.

Options

af-name	Name of the af interface being created on the GNF. • **Range:** af0 through af9
id *peer-gnf -id*	Name of the GNF peer connected using the af interface. • **Range:** 1 through 10
remote-af-name	Name of the af interface on the peer GNF.
description *af-description*	A description for the af interface.

Syntax

```
agent-address outgoing-interface;
```

Hierarchy Level

```
[edit snmp trap-options]
```

Description

Set the agent address of all SNMPv1 traps generated by this router or switch. Currently, the only option is **outgoing-interface**, which sets the agent address of each SNMPv1 trap to the address of the outgoing interface of that trap.

Options

outgoing-interface—Value of the agent address of all SNMPv1 traps generated by this router or switch. The **outgoing-interface** option sets the agent address of each SNMPv1 trap to the address of the outgoing interface of that trap.

- **Default:** disabled (the agent address is not specified in SNMPv1 traps).

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

agent-specifier

IN THIS SECTION

- Syntax | 2051
- Hierarchy Level | 2052
- Description | 2052
- Default | 2052
- Options | 2052
- Required Privilege Level | 2053
- Release Information | 2053

Syntax

```
agent-specifier {
    aci circuit-id-string ari remote-id-string {
        drop;
        delay seconds;
```

```
        terminate;
        dynamic-profile profile-name;
        routing-instance routing-instance-name;
        static-interface interface-name;
    }
}
```

Hierarchy Level

```
[edit protocols pppoe service-name-tables table-name service service-name]
```

Description

Specify the action taken by the interface for the specified agent circuit identifier/agent remote identifier (ACI/ARI) pair when the interface receives a PPPoE Active Discovery Initiation (PADI) control packet that includes the vendor-specific tag with ACI/ARI pair information. You can configure an ACI/ARI pair for a named service, `empty` service, or `any` service in a PPPoE service name table. A maximum of 8000 ACI/ARI pairs are supported per PPPoE service name table. You can distribute the ACI/ARI pairs in any combination among the named, `empty`, and `any` service entries in the service name table.

You can use an asterisk (*) as a wildcard character to match ACI/ARI pairs, the ACI alone, or the ARI alone. The asterisk can be placed only at the beginning, the end, or both the beginning and end of the identifier string. You can also specify an asterisk alone for either the ACI or the ARI. You cannot specify only an asterisk for both the ACI and the ARI. When you specify a single asterisk as the identifier, that identifier is ignored in the PADI packet.

For example, suppose you care about matching only the ACI and do not care what value the ARI has in the PADI packet, or even whether the packet contains an ARI value. In this case you can set the *remote-id-string* to a single asterisk. Then the interface ignores the ARI received in the packet and the interface takes action based only on matching the specified ACI.

Default

The default action is terminate.

Options

`aci` *circuit-id-string*—Identifier for the agent circuit ID that corresponds to the DSLAM interface that initiated the service request. This is a string of up to 63 characters.

`ari` *`remote-id-string`*—Identifier for the subscriber associated with the DSLAM interface that initiated the service request. This is a string of up to 63 characters.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

```

Description

On M40e, M120, and M320 edge routers with Flexible PIC Concentrator (FPC) input as FFPC and FPC output as SFPC, and on MX Series, T320, T640, and T1600 edge routers with Enhanced Intelligent Queuing (IQE) PICs, T4000 routers with Type 5 FPC and Enhanced Scaling Type 4 FPC, configure an aggregate hierarchical policer.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

firewall—To view this statement in the configuration.

firewall-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.5.

Support at the `[edit dynamic-profiles ... hierarchical-policer name]` hierarchy level introduced in Junos OS Release 11.4.

aggregate-label

IN THIS SECTION

- Syntax | **2067**
- Hierarchy Level | **2067**
- Description | **2067**
- Options | **2067**
- Required Privilege Level | **2067**
- Release Information | **2067**

Syntax

```
aggregate-label {
    community community-name;
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols bgp family inet labeled-unicast],
[edit logical-systems logical-system-name protocols bgp family inet6 labeled-unicast],
[edit logical-systems logical-system-name protocols bgp family inet-vpn unicast],
[edit logical-systems logical-system-name protocols bgp family inet-vpn6 unicast],
[edit protocols bgp family inet labeled-unicast],
[edit protocols bgp family inet6 labeled-unicast],
[edit protocols bgp family inet-vpn unicast],
[edit protocols bgp family inet6-vpn unicast]
```

Description

Specify matching criteria (in the form of a community) such that all routes which match are assigned the same VPN label, selected from one of the several routes in the set defined by this criteria. This reduces the number of VPN labels that the router must consider, and aggregates the received labels.

Options

`community` *`community-name`*—Specify the name of the community to which to apply the aggregate label.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Configuring Aggregate Labels for VPNs

aggregate (Protocols RSVP)

IN THIS SECTION

- Syntax | 2068
- Hierarchy Level | 2068
- Description | 2068
- Default | 2069
- Required Privilege Level | 2069
- Release Information | 2069

Syntax

```
(aggregate | no-aggregate);
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols rsvp peer-interface peer-interface-name],
[edit protocols rsvp peer-interface peer-interface-name]
```

Description

Control the use of RSVP aggregate messages on an interface or peer interface, as described below.

NOTE: Starting in Junos OS Release 15.2, the `aggregate` statement is deprecated at the `[edit protocols rsvp interface interface-name]` and `[edit logical-systems logical-system-name`

protocols rsvp interface *interface-name*] hierarchy levels, as RSVP message aggregation is enabled by default.

- aggregate—Use RSVP aggregate messages.
- no-aggregate—Do not use RSVP aggregate messages.

  Aggregate messages can pack multiple RSVP messages into a single transmission, thereby reducing network overhead and enhancing efficiency. The number of supportable sessions and processing overhead are significantly improved when aggregation is enabled.

  Not all routers connected to a subnet need to support aggregation simultaneously. Each RSVP router negotiates its intention to use aggregate messages on a per-neighbor basis. Only when both routers agree are aggregate messages sent.

To have refresh reduction and reliable delivery, you must include the aggregate and reliable statements.

Default

Aggregation is enabled.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

        ... aggregate-options ...
    }
    route destination-prefix {
        policy policy-name;
        ... aggregate-options ...
            algorithm number
                description description;
            }
         }
    }
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-instances routing-instance-name routing-
options],
[edit logical-systems logical-system-name routing-instances routing-instance-name routing-
options rib routing-table-name],
[edit logical-systems logical-system-name routing-options],
[edit logical-systems logical-system-name routing-options rib routing-table-name],
```

```
[edit routing-instances routing-instance-name routing-options],
[edit routing-instances routing-instance-name routing-options rib routing-table-name],
[edit routing-options],
[edit routing-options rib routing-table-name]
```

Description

Configure aggregate routes.

Options

aggregate-options—Additional information about aggregate routes that is included with the route when it is installed in the routing table. Specify zero or more of the following options in ***aggregate-options***. Each option is explained separately.

- ***active***— Removes inactive routes from the forwarding table.
- ***passive***— Retains inactive routes in the forwarding table.
- **as-path <*as-path*> <origin (egp | igp | incomplete)> <atomic-aggregate> <aggregator *as-number ip-address*>**;

- **(brief | full)**;
- **community [*community-ids*]**;
- **discard**;
- **(metric | metric2 | metric3 | metric4) *value* <type *type*>**;
- **(preference | preference2 | color | color2) *preference* <type *type*>**;
- **tag *metric* type *number***;

algorithm *number*—Specify an IGP algorithm for the aggregate route. IS-IS can advertise aggregate routes as SRv6 locators for locator summarization, In addition to the IPv6 aggregate prefix advertisement, IS-IS advertises the summary locator only if the node participates in the specified flexible algorithm.

- **Range**—Specify an algorithm from 0 through 255.

> **NOTE:**
> *IGP Algorithm Types*

defaults—Specify global aggregate route options. These options only set default attributes inherited by all newly created aggregate routes. These are treated as global defaults and apply to all the aggregate routes you configure in the `aggregate` statement. This part of the `aggregate` statement is optional.

route *destination-prefix*—Configure a nondefault aggregate route:

- **default**—For the default route to the destination. This is equivalent to specifying an IP address of **0.0.0.0/0**.
- ***destination-prefix/ prefix-length***—***destination-prefix*** is the network portion of the IP address, and ***prefix-length*** is the destination prefix length.
- **next-table *next-table***—Specify the name of the next routing table to the destination. Forwarding for the aggregate prefix is done using this table. When you configure **next-table** to **next-hop**, route lookup is redirected to the route table that the next hop points to.

description *description*—Configure a description for the aggregate aggregate route. The configured description will be stored in backend data-structures and is used as an aggregate description in telemetry streaming.

The `policy` statement is explained separately.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

    maximum-links maximum-links-limit;
}
```

Description

Configure properties for aggregated devices on the switch.

Configure properties for aggregated devices on the router. Aggregate Ethernet links are logical interfaces defined on the device that bundle together multiple physical interfaces into a single interface for the use of redundancy and bandwidth aggregation. When interconnecting devices you can create aggregate ethernet interfaces to bundle together multiple physical ethernet links to increase bandwidth and redundancy between devices.

Link aggregation enables you to group Ethernet interfaces to form a single link layer interface. Link Aggregation Control Protocol (LACP) is supported in chassis cluster deployments, where aggregated Ethernet interfaces and redundant Ethernet interfaces are supported simultaneously.

You must first configure the system to enable configuring the Aggregated Ethernet (ae) Interfaces. By default, Juniper devices do not have any aggregated ethernet interfaces created. To configure the device to support a given number of ae interfaces, you must define it on a per chassis basis using the `set chassis aggregated-devices devices {1-32}` in configuration mode. The number of devices you define will be the number of aggregated ethernet interfaces that the system will create which can be configured just like any other ethernet interface. Also you can view the interfaces created by using the `show interface terse` command. Once you have defined the number of aggregated ethernet devices on the chassis you can then continue to configure the LAG members on a per ethernet interface basis.

The remaining statements are explained separately. See CLI Explorer.

Default

Aggregated devices are disabled.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Release Information

Statement introduced for SRX devices in Junos OS Release 7.4.

Statement introduced in Junos OS Release 9.0.

Support for LACP link protection and system priority introduced in Junos OS Release 9.3.

aggregated-inline-services-options (Aggregated Inline Services)

IN THIS SECTION

Syntax | **2083**

- Hierarchy Level | 2083
- Description | 2083
- Required Privilege Level | 2084
- Release Information | 2084

Syntax

```
aggregated-inline-services-options {
    primary-interface interface-name;
    secondary-interface interface-name;
}
```

Hierarchy Level

```
[edit interfaces asix]
```

Description

Configure the members of an aggregated inline service interface bundle to provide 1:1 stateful LNS redundancy for an LNS sessions in a tunnel group.

BEST PRACTICE: Follow these guidelines:

- You must configure `unit 0 family inet` for each bundle; otherwise, the session fails to come up.
- The primary (active) and secondary (backup) interfaces must be on different MPCs. If you configure both interfaces on the same MPC, the subsequent configuration commit fails.
- The bandwidth configured at the `[edit chassis fpc slot pic number inline-services bandwidth]` hierarchy level must be the same for both member links.

- An si interface configured as a member of an aggregated inline service bundle cannot be configured as a member of another bundle group.
- An si interface configured as a member of an aggregated inline service bundle cannot also be used for any function that is not related to aggregated services; for example, it cannot be used for inline IP reassembly.
- When you configure an si interface as a member of an aggregated inline services bundle, you can no longer configure that si interface independently. You can configure only the parent bundle; the bundle's configuration is applied immediately to all member interfaces.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

[edit forwarding-options sampling instance instance-name family (inet |inet6 |mpls) output flow-
server hostname],
[edit forwarding-options sampling family (inet |inet6 |mpls) output flow-server hostname]
```

Description

For cflowd version 8 only, specify the type of data to be aggregated; cflowd records and sends only those flows that match the specified criteria.

Options

`autonomous-system`—Aggregate by autonomous system (AS) number.

`caida-compliant`—Record source and destination mask-length values in compliance with the Version 2.1b1 release of CAIDA's cflowd application. If this statement is not configured, the Junos OS records source

and destination mask length values in compliance with the *cflowd Configuration Guide*, dated August 30, 1999.

`destination-prefix`—Aggregate by destination prefix.

`protocol-port`—Aggregate by protocol and port number.

`source-destination-prefix`—Aggregate by source and destination prefix.

`source-prefix`—Aggregate by source prefix.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

aging-timer (Junos Fusion)

IN THIS SECTION

- Syntax | 2091
- Hierarchy Level | 2091
- Description | 2091
- Default | 2092
- Options | 2092
- Required Privilege Level | 2092
- Release Information | 2092

Syntax

```
aging-timer aging-timer;
```

Hierarchy Level

```
[edit chassis satellite-management]
```

Description

Configure the aging timer on the aggregation device in a Junos Fusion.

The aging timer is used on the aggregation device to specify the amount of time, in minutes, to maintain the device state of an unreachable satellite device before deleting the satellite device from the Junos Fusion.

If the unreachable satellite device is discovered before the aging timer expires, the satellite device is reactivated in the Junos Fusion without having to restore its device state.

Default

The default aging time is 10 minutes.

Options

The remaining statements are explained separately.

- **Range:** 2 through 60,000 minutes

```

Description

Enable the accumulated interior gateway protocol (AIGP) BGP attribute on a protocol family. Configuring AIGP on a particular family enables sending and receiving of the AIGP attribute on that family.

The AIGP attribute enables deployments in which a single administration can run several contiguous BGP autonomous systems (ASs). Such deployments allow BGP to make routing decisions based on the IGP metric. With AIGP enabled, BGP can select paths based on IGP metrics. This enables BGP to choose the shortest path between two nodes, even though the nodes might be in different ASs. The AIGP attribute is particularly useful in networks that use tunneling to deliver a packet to its BGP next hop. Such is the case with MPLS label-switched paths.

Options

disable—Explicitly disables AIGP.

- **Default:** Disabled, meaning that the device does not send an AIGP attribute and silently discards a received AIGP attribute.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1.

aigp-originate | 2097

aigp-adjust (Policy Action)

IN THIS SECTION

- Syntax | 2095
- Hierarchy Level | 2095
- Description | 2096
- Options | 2096
- Required Privilege Level | 2096
- Release Information | 2096

Syntax

```
aigp-adjust (add|divide|multiply|subtract) (user-value | distance-to-protocol-nexthop);
```

Hierarchy Level

```
[edit policy-options policy-statement policy-name term term-name then],
[edit policy-options policy-statement policy-name then]
```

Description

Specify this CLI policy action in an import or export policy to modify the accumulated interior gateway protocol (AIGP) BGP attribute. You can modify the AIGP attribute for one of the following reasons:

- Modify the AIGP metric on the route if it exists on the external BGP sessions between two ASBR routers where there is no interior gateway protocol (IGP)
- Scale up or down while transitioning from one IGP domain, such as OSPF to another IGP domain, such as IS-IS
- Make very minor adjustments on the AIGP from another AS domain or another vendor's routers

> **CAUTION**: AIGP is rated very high in the best route decision and comes only after the BGP local preference rule. Therefore, use the AIGP adjustment option with caution as it can have a huge impact on the network.

Options

add | divide | multiply | subtract	Specify the mathematical operation that needs to be performed on the original AIGP attribute for adjustment.
user-value	Specify an unsigned 64-bit value in decimal.
distance-to-protocol-nexthop	Use the current metric2 value in the routing table as specified in the routing policy. Configure this option in the export policy if you want full control of the advertised AIGP value and do not want BGP to add up the distance to the protocol nexthop.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.1.

aigp-originate

IN THIS SECTION

- Syntax | 2097
- Hierarchy Level | 2097
- Description | 2098
- Default | 2098
- Options | 2098
- Required Privilege Level | 2098
- Release Information | 2098

Syntax

```
aigp-originate distance;
```

Hierarchy Level

```
[edit logical-systems logical-system-name policy-options policy-statement policy-name term term-
name then],
[edit logical-systems logical-system-name policy-options policy-statement policy-name
then],
[edit policy-options policy-statement policy-name term term-name then],
[edit policy-options policy-statement policy-name then]
```

Description

Originate an accumulated interior gateway protocol (AIGP) BGP attribute for a given prefix by export policy, using the `aigp-originate` policy action.

To originate an AIGP attribure, you need configure the policy action on only one node. The AIGP attribute is readvertised if the neighbors are AIGP enabled with the `aigp` statement in the BGP configuration.

Default

If you omit the `aigp-originate` policy action, the node still readvertises the AIGP BGP attribute if AIGP is enabled in the BGP configuration. However, the node does not originate its own AIGP attribute for local prefixes.

As the route is readvertised by downstream nodes, the cost of the AIGP attribute reflects the IGP distance to the prefix (zero + IGP distance or configured distance + IGP distance).

Options

`distance`—(Optional) Associate an initial cost when advertising a local prefix with the AIGP BGP attribute.

- **Range:** 0 through 4,294,967,295
- **Default:** The initial cost associated with the AIGP attribute for a local prefix is zero. The *`distance`* option overrides the default zero value for the initial cost.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1.

Syntax

```
alarm {
    interface-type {
        alarm-name (ignore |red | yellow);
    }
}
```

Hierarchy Level

```
[edit chassis],
[edit chassis interconnect-device name],
[edit chassis node-group name]
```

Description

Configure the chassis alarms and whether they trigger a red or yellow alarm, or whether they are ignored. Red alarm conditions light the `RED ALARM` LED on either the router's craft interface or the switch's LCD screen and trigger an audible alarm if one is connected to the contact on the craft interface or LCD screen. Yellow alarm conditions light the `YELLOW ALARM` LED on either the router's craft interface or the switch's LCD screen and trigger an audible alarm if one is connected to the craft interface or LCD screen.

To configure more than one alarm, include multiple *`alarm-name`* lines.

Options

`alarm-name`—Alarm condition. For example, `input1`, `input2`

`ignore`—The specified alarm condition does not set off any alarm.

`interface-type`—Type of interface on which you are configuring the alarm: `psm`, `fpc`, `atm`, `ethernet`, `sonet`, or `t3`.

`red`—The specified alarm condition sets off a red alarm.

`yellow`—The specified alarm condition sets off a yellow alarm.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

        }
        description description;
    }
}
```

Hierarchy Level

```
[edit chassis]
```

Description

Configure an alarm input or output on the dedicated alarm port on the router. You can use the alarm input configuration to receive alarm inputs from the external devices such as sensors. You can use the alarm output configuration to relay the alarms in the router to external alarm devices. You can configure up to three alarm inputs and one alarm output.

Options

port-number Specify the port number for the alarm input or output. The system supports up to three alarm input ports (port number: 1 to 3). The system supports only one alarm output port (port number: 1)

active Applicable only to alarm inputs.

Configure a signal polarity for the alarm input based on the user environment. The alarm relay becomes operational when the input signal polarity is high or low based on this configuration. The following options are available.

- high
- low
- **Default:** low

admin-state Specify the administrative state of the alarms.

- disabled—Disable the alarm configuration. If you choose this option, the router will not trigger the alarm configured on this port. Disabling an alarm configuration does not delete the alarm. You can enable it when required.
- enabled—Enable the alarm configuration.
- **Default:** disabled

description *description* Provide a description for the alarm input or output. For example, you can provide a description to identify the device connected to the alarm port.

severity Applicable only to alarm inputs.

Configure an alarm severity. The system supports the following alarm severities.

- critical
- major
- minor
- warning

> **NOTE**: The system considers the alarm inputs configured with the critical or major severity as major alarms. The alarm inputs configured with the minor or warning severity are considered minor alarms.

- **Default:** critical

Required Privilege Level

- Description | 2121

- Options | 2121
- Required Privilege Level | 2121
- Release Information | 2122

Syntax

```
alarm-threshold {
    forward number;
    reverse number;
}
```

Hierarchy Level

```
[edit security gtp profile profile-name path-rate-limit message-type (create-req | delete-req |
echo-req | other)]
```

Description

Use the alarm-threshold parameter to configure the device to raise an alarm, when the GPRS tunneling protocol (GTP) control messages on a path have reached the configured limit.

From Junos OS Release 20.4R1 onwards, the `[edit security gprs gtp profile profile-name path-rate-limit message-type (create-req | delete-req | echo-req | other)]` hierarchy-level is replaced by `[edit security gtp profile profile-name path-rate-limit message-type (create-req | delete-req | echo-req | other)]`.

Options

number—To limit messages in forward or reverse direction.

- **Range:** For create request, delete request and other GTP control messages, the applicable range is 1 through 10,000 packets per second. For echo request, the applicable range is 1 through 10,000 packets per minute.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1X45-D10.

RELATED DOCUMENTATION

alarm-without-drop

IN THIS SECTION

- Syntax | 2122
- Hierarchy Level | 2122
- Description | 2123
- Required Privilege Level | 2123
- Release Information | 2123

Syntax

```
alarm-without-drop;
```

Hierarchy Level

```
[edit security screen ids-option screen-name]
```

Description

Direct the SRX device to generate an alarm when detecting an attack but not block the attack. Use this statement to allow an attack to enter a segment of your network that you have previously prepared to receive it (for example, a honeynet, which is a decoy network with extensive monitoring capabilities).

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

alarm-without-drop (IDS Screen Next Gen Services)

IN THIS SECTION

- Syntax | 2123
- Hierarchy Level | 2124
- Description | 2124
- Required Privilege Level | 2124
- Release Information | 2124

Syntax

```
alarm-without-drop;
```

Hierarchy Level

```
[edit services screen ids-option screen-name]
```

Description

Configure the IDS screen to log an alarm for an offending packet, but not drop the packet. The screen skips the rest of the screen checks. The packet is not counted as a dropped packet.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 19.3R2.

Description

Configure an Application Layer Gateway (ALG) on the device. An ALG runs as a service and can be associated in policies with specified types of traffic. ALGs are enabled by default.

Options

`bytes`—Maximum length in bytes of a single DNS message.

- **Range:** 512 through 8192 bytes
- **Default:** 512 bytes

`c-timeout` *`value-in-minutes`*—Specifies the timeout interval for Session Initiation Protocol (SIP) transactions in minutes.

- **Range:** 3 through 10 minutes
- **Default:** 3 minutes

`endpoint-registration-timeout` *`value-in-seconds`*—Specifies the timeout value in seconds for entries in the NAT table.

- **Range:** 10 through 50,000 seconds
- **Default:** 3600 seconds

`inactive-media-timeout` *`value-in-seconds`*—(MGCP) Specifies the maximum time duration that the temporary openings in the firewall (pinholes) remain open for media if no activity is detected.

- **Range:** 10 through 2550 seconds
- **Default:** 120 seconds

`inactive-media-timeout` *`value-in-seconds`*—(SCCP) Specifies the maximum time duration that the temporary openings in the firewall (pinholes) remain open for media if no activity is detected.

- **Range:** 10 through 600 seconds
- **Default:** 120 seconds

`inactive-media-timeout` *`value-in-seconds`*—(SIP) Specifies the maximum time duration that the temporary openings in the firewall (pinholes) remain open for media if no activity is detected.

- **Range:** 0 through 2550 seconds
- **Default:** 120 seconds

maximum-call-duration *`value-in-minutes`*—Specifies the maximum time duration at which the call ends and releases the media sessions.

- **Range:** 3 through 720 minutes
- **Default:** 720 minutes

`media-source-port-any`—Allow media traffic from any port number. By default, this feature is disabled, which allows a temporary opening in the firewall (pinhole) for media traffic to be opened.

`retain-hold-resource`—Enable the device to not free media resources for a Session Initiation Protocol (SIP) Application Layer Gateway (ALG), even when a media stream is placed on hold. By default, media stream resources are released when the media stream is held.

`transaction-timeout` *`value-in-seconds`*—Specifies timeout value for Media Gateway Control Protocol (MGCP) transactions. If the timeout value exceeds the limit, the transaction removed by MGCP transactions ager out processing.

- **Range:** 3 through 50 seconds
- **Default:** 30 seconds

`t1-interval` *`value-in-milliseconds`*—Specifies the maximum round-trip time (RTT) (in milliseconds) allowed for Session Initiation Protocol (SIP) transactions.

- **Range:** 500 through 5000 milliseconds
- **Default:** 500 milliseconds

`t4-interval` *`value-in-seconds`*—Specifies the maximum length of time (in seconds) that the network can take to clear messages between client and server Session Initiation Protocol (SIP) transactions.

- **Range:** 5 through 10 seconds
- **Default:** 5 seconds

Description

Define individual Application Layer Gateway (ALG).

The `twamp` application protocol is introduced Junos OS Release 18.2R1.

Options

ALG supports the following application protocols:

- `dns` —Domain Name Service
- `ftp` —File Transfer Protocol
- `ftp-data` —Trace FTP Data Session
- `gprs-gtp-c` —GPRS Tunneling Control Plane
- `gprs-gtp-u` —GPRS Tunneling User Plane
- `gprs-gtp-v0` —GPRS Tunneling Version 0
- `gprs-sctp` —GPRS Stream Control Protocol
- `http` —Hypertext Transfer Protocol
- `https` —Hypertext Transfer Protocol
- `ignore`—Ignore application type
- `ike-esp-nat` —IKE ESP NAT application protocol
- `mgcp-ca` —Media Gateway Control Protocol with Call Agent
- `mgcp-ua` —MGCP with User Agent
- `ms-rpc` —Microsoft RPC

- `none` —Bypass all ALG application protocols.
- `pptp` —Point-to-Point Tunneling Protocol
- `q931` —ISDN connection control protocol (Q.931)
- `ras` —Remote Access Service
- `realaudio` —RealAudio
- `rsh` —UNIX remote shell services
- `rtsp` —Real-Time Streaming Protocol
- `sccp` —Skinny Client Control Protocol
- `sip`—Session Initiation Protocol
- `smtp` —Simple Mail Transfer Protocol
- `sqlnet-v2` —Oracle SQLNET v2
- `ssh` —Secure Shell Protocol
- `sun-rpc` —Sun Microsystems RPC
- `talk`—TALK program
- `telnet` —Telnet Protocol
- `tftp` —Trivial File Transfer Protocol
- `twamp`—Two-Way Active Measurement Protocol

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

Syntax

```
alg-manager {
    clear-dont-frag-bit {
        traceoptions {
            flag {
                all {
                    extensive
                }
            }
        }
    }
}
```

Hierarchy Level

```
[edit security alg]
```

Description

Configure the Application Layer Gateway (ALG) manager.

Options

clear-dont-frag-bit Starting in Junos OS Release 15.1X49-D200, we've introduced the `clear-dont-frag-bit` option to disable the do not fragment flag from the packet IP header, which allows to split the packet after the NAT translation.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

security—To view this statement in the configuration.

```

Hierarchy Level

```
[edit protocols pim interface interface-name bfd-liveness-detection authentication],
[edit routing-instances routing-instance-name protocols pim interface interface-name bfd-
liveness-detection authentication]
```

Description

Specify the algorithm to use for BFD authentication.

Options

algorithm-name—Name of algorithm to use for BFD authentication:

- **simple-password**—Plain-text password. One to 16 bytes of plain text. One or more passwords can be configured.
- **keyed-md5**—Keyed Message Digest 5 hash algorithm for sessions with transmit and receive rates greater than 100 ms.

- **meticulous-keyed-md5**—Meticulous keyed Message Digest 5 hash algorithm.
- **keyed-sha-1**—Keyed Secure Hash Algorithm I for sessions with transmit and receive rates greater than 100 ms.
- **meticulous-keyed-sha-1**—Meticulous keyed Secure Hash Algorithm I.

alias (Interfaces)

IN THIS SECTION

- Syntax | 2147
- Hierarchy Level | 2147
- Description | 2147
- Options | 2147

Required Privilege Level | 2147
Release Information | 2148

Syntax

```
alias alias-name;
```

Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]
```

Description

Configure a textual description of a physical interface or the logical unit of an interface to be the alias of an interface name. The alias name can be a single line of text. If the text contains spaces, enclose it in quotation marks. If you configure an alias name, the alias name is displayed instead of the interface name in the output of all `show`, `show interfaces`, and other operational mode commands. In Junos OS Release 12.3R8 and later, display of the alias can be suppressed in favor of the actual interface name by using the `display no-interface-alias` parameter along with the show command.

Options

alias-name Text to denote an easily identifiable, meaningful alias name for the interface. If the text includes spaces, enclose the entire text in quotation marks.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.3.

```
        assigned-director-device-name;
    }
    interconnect-device interconnect-device-name {
        assigned-interconnect-device-name;
    }
    node-device node-device-name {
        assigned-node-device-name;
    }
```

Hierarchy Level

```
[edit fabric]
```

Description

(QFabric systems only) Specify the mapping of user defined names to QFabric system components. You can reassign names for Director devices, Interconnect devices, and Node devices.

The remaining statements are explained separately. See CLI Explorer.

NOTE: The following rules apply to QFabric component alias naming:

- Alias names must use alphabetic (A through Z and a through z), numeric (0 through 9), or dash (-) characters.
- The maximum length of an alias name is 30 characters.
- Alias names are case sensitive. For example, MY-NG-1 and my-ng-1 refer to different components.
- You cannot use the reserved names `all`, `fabric`, or `director-group` as an alias name.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.3.

Options `director-group` and `interconnect-device` introduced in Junos OS Release 12.2 for the QFX Series.

aliases (Virtual Chassis)

IN THIS SECTION

- Syntax | 2153
- Hierarchy Level | 2153
- Description | 2154
- Options | 2154
- Required Privilege Level | 2155
- Release Information | 2155

Syntax

```
aliases {
    serial-number serial-number {
        alias-name alias-name;
    }
}
```

Hierarchy Level

```
[edit virtual-chassis]
```

Description

Optionally create an alias for a member switch in a Virtual Chassis or Virtual Chassis Fabric (VCF). You can more clearly identify the member switches in your Virtual Chassis or VCF by assigning text labels (alias names) to them, associating the alias name with member switch serial numbers. Aliases are for administrative purposes only and have no effect on member switch operations.

The `show virtual-chassis` command displays assigned alias names in the `Alias-Name` output field.

Options

serial-number The permanent serial number for the member switch in the Virtual Chassis or VCF that you want to label with an alias name. Serial number values are case-sensitive.

The `show virtual-chassis` command displays the serial number for all members in the Virtual Chassis or VCF in the `Serial No` output field.

alias-name The text label you want to assign to the member switch.

For example, if you configure alias name `dc-floor-1` in a VCF for member switch 0 with serial number AB012345678 as follows:

```
[edit virtual-chassis aliases]
user@switch# set serial-number AB0123456789 alias-name dc-floor-1
```

then you'll see the alias **dc-floor-1** in the Alias-Name column in the output from the `show virtual-chassis` command:

show virtual-chassis

```
user@switch> show virtual-chassis
Preprovisioned Virtual Chassis Fabric
Fabric ID: 9d5d.5556.919a
Fabric Mode: Enabled
                                                                  Mstr
Member ID  Status   Serial No      Alias-Name     Model            prio    Role
0 (FPC 0)  Prsnt    AB0123456789   dc-floor-1     qfx5100-48s-6q   129     Master
.
```

```
.
.
```

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.1X53-D10.

all-regions

IN THIS SECTION

- Syntax | 2157
- Hierarchy Level | 2158
- Description | 2158
- Options | 2158
- Required Privilege Level | 2158
- Release Information | 2158

Syntax

```
all-regions {
    incoming;
    ingress-replication {
        create-new-ucast-tunnel;
        label-switched-path {
            label-switched-path-template (Multicast) {
                (default-template | lsp-template-name);
            }
        }
    }
    ldp-p2mp;
    rsvp-te {
        label-switched-path-template (Multicast) {
            (default-template | lsp-template-name);
        }
        static-lsp static-lsp;
    }
}
```

Hierarchy Level

```
[edit protocols mvpn inter-region-template template template-name]
```

Description

Specify the tunnel support for all regions that are not defined in the more specific regions. The `all-regions` statement supports different tunnel types such as incoming, ingress replication, ldp-p2mp, or rsvp-te. The incoming tunnel indicates that the tunnel type across the area boundary router (ABR) is not changed.

Options

incoming Specify the tunnel type to be the same across the ABR.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

allow

IN THIS SECTION

- Syntax | 2160
- Hierarchy Level | 2160
- Description | 2161
- Options | 2161
- Required Privilege Level | 2161
- Release Information | 2161

Syntax

```
allow (all | [ network/mask-length ]);
```

Hierarchy Level

```
[edit logical-systems name protocols bgp group name],
[edit logical-systems name routing-instances name protocols bgp group name],
[edit protocols bgp group name],
[edit routing-instances name protocols bgp group name],
```

```
[edit logical-systems name protocols bgp group name dynamic-neighbor dyn-name],
[edit logical-systems name routing-instances name protocols bgp group name dynamic-neighbor dyn-
name],
[edit logical-systems name tenants name routing-instances name protocols bgp group name dynamic-
neighbor dyn-name],
[edit protocols bgp group name dynamic-neighbor dyn-name],
[edit routing-instances name protocols bgp group name dynamic-neighbor dyn-name]
```

Description

Implicitly configure BGP peers, allowing peer connections from any of the specified networks or hosts. To configure multiple BGP peers, configure one or more networks and hosts within a single `allow` statement or include multiple `allow` statements.

You can configure authentication for all implicitly configured peers at `[edit protocols bgp group]` level and to configure different authentication values for each prefix, you must configure `allow` under `dynamic-neighbor` *`dyn-name`* hierarchy.

You can limit the number of BGP sessions belonging to a given subnet using the `peer-limit` statement.

> **NOTE**: When `set protocols bgp group` *`group-name`* `allow network` is configured to accept dynamic BGP sessions, `unconfigured-peer-graceful-restart` statement should be configured to avoid traffic drop during graceful restart or graceful Routing Engine switchover.

Options

all—Allow all addresses, which is equivalent to **0.0.0.0/0** (or **::/0**).

network/ mask-length—IPv6 or IPv4 network number of a single address or a range of allowable addresses for BGP peers, followed by the number of significant bits in the subnet mask.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Statement introduced under `[edit protocols bgp group group-name dynamic-neighbor dyn-name]` hierarchy in Junos OS Release 19.1.

allow-6pe-traceroute

IN THIS SECTION

- Syntax | 2162
- Hierarchy Level | 2162
- Description | 2162
- Required Privilege Level | 2163

Syntax

```
allow-6pe-traceroute;
```

Hierarchy Level

```
[edit system]
```

Description

Allow IPv4-mapped IPv6 source addresses in an ICMPv6 echo request TTL expired packets.

In a dual-stack IPv6 network connected over an IPv4 MPLS network, the P routers in the IPv4 MPLS backbone do not have an IPv6 family. Consequently, the transit P routers are not shown in the output when you do an IPv6 traceroute. To generate an ICMPv6 echo request and a TTL expired response

packet to and from the intermediate transit routers in the 6PE network, you must configure this statement along with the `allow-v4-mapped` statement.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

allow-active-leasequery (DHCP Local Server)

IN THIS SECTION

- Syntax | 2163
- Hierarchy Level | 2164
- Description | 2164
- Options | 2164
- Required Privilege Level | 2164
- Release Information | 2165

Syntax

```
allow-active-leasequery {
    idle-timeout seconds;
    timeout seconds;
}
```

Hierarchy Level

```
[edit system services dhcp-local-server],
[edit system services dhcp-local-server dhcpv6],
[edit logical-systems logical-system-name routing-instances routing-instance-name system
services ...],
[edit logical-systems logical-system-name system services ...],
[edit routing-instances routing-instance-name system services ...]
```

Description

Enable a DHCPv4 or DHCPv6 local server to listen for, process, and respond to active leasequery requests received on TCP connections on TCP port 67 for DHCPv4 and on TCP port 547 for DHCPv6.

NOTE: Because active leasequery is an extension of bulk leasequery, you must also configure bulk leasequery before you configure active leasequery.

Options

idle-timeout *seconds*

(Optional) Specify the number of seconds that pass with no activity before the TCP connection is terminated and restarted.

- **Range:** 10 through 3600
- **Default:** 60

timeout *seconds*

(Optional) Specify the number of seconds that TCP read/write operations can be blocked before the TCP connection is terminated and restarted.

- **Range:** 10 through 3600
- **Default:** 120

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

allow-bulk-leasequery (DHCP Local Server)

IN THIS SECTION

- Syntax | 2165
- Hierarchy Level | 2165
- Description | 2166
- Options | 2166
- Required Privilege Level | 2167
- Release Information | 2167

Syntax

```
allow-bulk-leasequery {
    max-connections number-of-connections;
    max-empty-replies number-of-replies;
    restricted-requestor;
    timeout seconds;
}
```

Hierarchy Level

```
[edit system services dhcp-local-server],
[edit system services dhcp-local-server dhcpv6],
```

```
[edit logical-systems logical-system-name routing-instances routing-instance-name system
services ...],
[edit logical-systems logical-system-name system services ...],
[edit routing-instances routing-instance-name system services ...]
```

Description

Enable a DHCPv4 or DHCPv6 local server to listen for, process, and respond to bulk leasequery requests received on TCP connections on TCP port 67 for DHCPv4 and on TCP port 547 for DHCPv6.

Options

max-connections *number-of-connections*

Specify the maximum number of concurrent TCP connections allowed in the logical system/routing instance. This setting helps you manage the resources that the `jdhcpd` daemon uses for bulk leasequery operations in the logical system/routing instance. The number of connections you specify for a logical system/routing instances must be less than the number of connections you specify for the global `accept-max-tcp-connections` statement.

- **Range:** 1 through 10
- **Default:** 3

max-empty-replies *number-of-replies*

Specify the maximum number of empty replies that the DHCP local server sends to a specific requestor. When the maximum number is reached, the DHCP server closes the connection.

An empty reply is a response sent from the DHCP local server that contains no bindings or has an option status code error. Empty replies are often the response to an unauthorized requestor that has sent an invalid or incorrect query that produces no binding information. By limiting the number of empty replies that the DHCP local server can send, you prevent the connection from being consumed by an unauthorized or malicious requester, and free up the DHCP local server to support legitimate requestors.

- **Range:** 1 through 100
- **Default:** 5

restricted-requestor

Specify that the DHCP local server responds to a bulk leasequery request by sending the binding information to restricted requestors only. This ensures that the requestor is the originator of the binding.

Restricted requestors are determined as follows:

- For DHCPv4 bulk leasequery requests, the giaddr of the requestor must match the giaddr of the client.
- For DHCPv6 bulk leasequery requests, the requestor's client ID in the bulk leasequery message must match the relay ID sent during binding creation.

timeout *seconds*

Specify the number of seconds that a connection on the TCP socket can be idle before the DHCP local server closes the connection. Closing inactive connections enables the DHCP local server to more efficiently apply resources in support of active TCP connections.

- **Range:** 1 through 1000
- **Default:** 120

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.1.

- Required Privilege Level | 2170
- Release Information | 2170

Syntax

```
allow-commands "regular-expression";
```

Hierarchy Level

```
[edit system scripts op file filename]
```

Description

Specify a regular expression that defines which operational mode commands to explicitly allow during execution of a local op script.

By default, when a user executes a script, the system does not permit the user to execute operational mode commands within a script for which their login class does not normally have permission to execute. You can explicitly enable the script to execute certain operational mode commands regardless of the permissions of the user invoking the script.

NOTE: The `allow-commands` statement does not support executing configuration mode commands.

> **NOTE**: Remote op scripts that are executed using the `op url` command do not support executing unauthorized operational mode commands even when you configure the `allow-commands` statement.

Required Privilege Level

maintenance—To view or add this statement in the configuration.

allow-dns-reply

IN THIS SECTION

- Syntax | 2171
- Hierarchy Level | 2171
- Description | 2171
- Required Privilege Level | 2171
- Release Information | 2171

Syntax

```
allow-dns-reply;
```

Hierarchy Level

```
[edit security flow]
```

Description

Allow an incoming Domain Name Service (DNS) reply packet without a matched request. By default, if an incoming UDP first-packet has dst-port 53, the device checks the DNS message packet header to verify that the query bit (QR) is 0, which denotes a query message. If the QR bit is 1, which denotes a response message, the device drops the packet, does not create a session, and increments the illegal packet flow counter for the interface. Using the `allow-dns-reply` directs the device to skip the check.

Required Privilege Level

security—To view this in the configuration.

security-control—To add this to the configuration.

allow-email (Security Fallback Block)

IN THIS SECTION

- Syntax | 2175
- Hierarchy Level | 2175
- Description | 2175
- Required Privilege Level | 2175
- Release Information | 2176

Syntax

```
allow-email;
```

Hierarchy Level

```
[edit security utm default-configuration]
[edit security utm feature-profile anti-virus juniper-express-engine profile profile-name
notification-options fallback-block]
[edit security utm feature-profile anti-virus kaspersky-lab-engine profile profile-name
notification-options fallback-block]
[edit security utm feature-profile anti-virus sophos-engine profile profile-name notification-
options fallback-block]
```

Description

Enable e-mail notification to notify a specified administrator when a fallback-block occurs.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

The Express and Kaspersky antivirus feature is not supported from Junos OS Release 15.1X49-D10 onwards. For previous releases, statement introduced in Junos OS Release 9.5. Support for Sophos engine added in Junos OS Release 11.1.

The `[edit security utm default-configuration]` hierarchy level is introduced in Junos OS Release 18.2R1.

allow-email (Security Virus Detection)

IN THIS SECTION

- Syntax | 2176
- Hierarchy Level | 2176
- Description | 2176
- Required Privilege Level | 2177
- Release Information | 2177

Syntax

```
allow-email;
```

Hierarchy Level

```
[edit security utm default-configuration]
[edit security utm feature-profile anti-virus profile notification-options virus-detect]
```

Description

Enable e-mail notification to notify a specified administrator when a virus is detected.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.1.

The `[edit security utm default-configuration]` hierarchy level is introduced in Junos OS Release 18.2R1.

allow-embedded-icmp

IN THIS SECTION

- Syntax | 2177
- Hierarchy Level | 2177
- Description | 2178
- Required Privilege Level | 2178
- Release Information | 2178

Syntax

```
allow-embedded-icmp;
```

Hierarchy Level

```
[edit security flow]
```

Description

Allow ICMP error packets to pass through the device even when there is no session match for the embedded packet. Once enabled, all packets encapsulated in ICMP pass through and no policy affects this behavior. This feature is useful when you have asymmetric routing in your network and you want to use traceroute and other ICMP applications on your device.

The default behavior is to inspect the IP packet which is embedded in the ICMP error packet. If the embedded packet is part of an existing session, the ICMP packet is allowed to pass through. If there is no match, it is dropped. Without the `allow-embedded-icmp` option configured, the default behavior applies.

Required Privilege Level

security—To view this in the configuration.

security-control—To add this to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3X48-D10.

RELATED DOCUMENTATION

allow-fragmentation (protocols mpls)

IN THIS SECTION

- Syntax | 2179
- Hierarchy Level | 2179
- Description | 2179
- Required Privilege Level | 2179
- Release Information | 2179

Syntax

```
allow-fragmentation;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols mpls path-mtu],
[edit protocols mpls path-mtu]
```

Description

Allow IP packets to be fragmented before they are encapsulated in MPLS.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

RELATED DOCUMENTATION

Enabling Packet Fragmentation

allow-fragmentation

IN THIS SECTION

Syntax | 2180
Hierarchy Level | 2180

- Description | 2180
- Default | 2180
- Required Privilege Level | 2181
- Release Information | 2181

Syntax

```
allow-fragmentation;
```

Hierarchy Level

```
[edit interfaces gr-fpc/pic/port unit logical-unit-number tunnel],
[edit logical-systems logical-system-name interfaces gr-fpc/pic/port unit logical-unit-number
tunnel]
```

Description

For a generic routing encapsulation (GRE) tunnel, enable fragmentation of GRE-encapsulated packets whose size exceeds the maximum transmission unit (MTU) value of a link that the packet passes through. The don't-fragment (DF) bit is not set in the outer IP header of GRE-encapsulated packets.

To enable the reassembly of fragmented GRE-encapsulated packets on GRE tunnel interfaces at the endpoint of the GRE tunnel, include the "reassemble-packets" on page 14100 statement for the interface.

> **NOTE**: The "reassemble-packets" on page 14100 statement is not supported on MPC10E line card in Junos OS Release 19.3.

Default

If you do not include the `allow-fragmentation` statement, fragmentation of GRE-encapsulated packets is disabled.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.2.

Statement introduced in Junos OS Release 19.3 for MPC10E line card.

allow-fragmentation (fti)

IN THIS SECTION

- Syntax | 2181
- Hierarchy Level | 2182
- Description | 2182
- Default | 2182
- Required Privilege Level | 2182
- Release Information | 2182

Syntax

```
allow-fragmentaion;
```

Hierarchy Level

```
[edit interfaces fti number unit logical-unit-number tunnel encapsulation (gre|udp|ipip)]
```

Description

For an encapsulated (UDP/GRE/IP-in-IP) tunnel, enable fragmentation of GRE-encapsulated packets whose size exceeds the maximum transmission unit (MTU) value of a link that the packet passes through. The don't-fragment (DF) bit is not set in the outer IP header of encapsulated packets.

Default

Don't Frafgment (DF) bit is set by default for the outer encapsulated IPv4 header.

Required Privilege Level

interface

Release Information

Statement introduced in Junos OS Evolved Release 23.2R1.

- Release Information | 2183

Syntax

```
(allow-icmp-without-flow | no-allow-icmp-without-flow);
```

Hierarchy Level

```
[edit security idp sensor-configuration flow]
```

Description

Allow an ICMP packet without matched request. By default the ICMP flow is enabled.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.2.

allow-ip-options (IDS MS-MPC)

IN THIS SECTION

- Syntax | 2184
- Hierarchy Level | 2184
- Description | 2184

- Default | 2184
- Options | 2185
- Required Privilege Level | 2185
- Release Information | 2185

Syntax

```
allow-ip-options {
    any;
    loose-source-route;
    route-alert;
    route-record;
    security;
    stream-id;
    strict-source-route;
    timestamp;
}
```

Hierarchy Level

```
[edit services ids rule rule-name term term-name then]
```

Description

Specify the type of IPv4 options that the IDS rule permits in the IP header of a packet. If the packet includes an option that is not configured, the packet is blocked. If the packet includes a configured option whose length is an illegal value, the packet is dropped. This IDS rule can only be assigned to a service set on an MS-MPC.

Default

If you do not include the `allow-ip-options` statement, packets with any type of IPv4 option are blocked.

Options

any	Allow all IPv4 options.
loose-source-route	Allow the Loose Source Route option.
route-alert	Allow the Router Alert option.
route-record	Allow the Record Route option.
security	Allow the Security option.
stream-id	Allow the Stream ID option.
strict-source-route	Allow the Strict Source Route option.
timestamp	Allow the Time Stamp option.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.1.

allow-ipv6-extension-header (IDS MS-MPC)

IN THIS SECTION

- Syntax | 2188
- Hierarchy Level | 2188
- Description | 2188
- Default | 2189
- Options | 2189
- Required Privilege Level | 2189
- Release Information | 2189

Syntax

```
allow-ipv6-extension-header {
    ah;
    any;
    dstopts;
    esp;
    fragment;
    hop-by-hop;
    mobility;
    routing;
}
```

Hierarchy Level

```
[edit services ids rule rule-name term term-name then]
```

Description

Specify the type of IPv6 extension headers that the IDS rule permits in a packet. If the packet includes an extension header that is not configured, the packet is blocked. If the packet includes configured

extension headers that are incorrect, the packet is dropped. This IDS rule can only be assigned to a service set on an MS-MPC.

Default

If you do not include the `allow-ipv6-extension-header` statement, packets with any type of extension header are blocked.

Options

ah	Allow Authentication Header extension header.
any	Allow all IPv6 extension headers.
dstopts	Allow Destination Options extension header.
esp	Allow Encapsulating Security Payload extension header.
fragment	Allow Fragment Header extension header.
hop-by-hop	Allow Hop-by-Hop Option extension header.
mobility	Allow Mobility Header extension header.
routing	Allow Routing Header extension header.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.1.

allow-l3vpn-traceroute-src-select

IN THIS SECTION

- Syntax | 2190
- Hierarchy Level | 2190
- Description | 2190
- Required Privilege Level | 2190
- Release Information | 2191

Syntax

```
allow-l3vpn-traceroute-src-select;
```

Hierarchy Level

```
[edit system]
```

Description

Select best source address for ICMP time-to-live (TTL) expiry error in case of Layer 3 VPNs. When a traceroute occurs over Layer 3 VPN and the TTL expired traffic is generated, the traceroute returns to the source through the routing instance. `allow-l3vpn-traceroute-src-select` determines the correct IP source address by reviewing the destination routing instance and destination IP address for Layer 3 VPN provider edge (PE) routers.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 18.4R1.

allow-leasequery (DHCP Local Server)

IN THIS SECTION

- Syntax | 2191
- Hierarchy Level | 2191
- Description | 2192
- Options | 2192
- Required Privilege Level | 2192
- Release Information | 2192

Syntax

```
allow-leasequery {
    restricted-requestor;
}
```

Hierarchy Level

```
[edit system services dhcp-local-server],
[edit system services dhcp-local-server dhcpv6],
[edit logical-systems logical-system-name routing-instances routing-instance-name system
services ...],
```

```
[edit logical-systems logical-system-name system services ...],
[edit routing-instances routing-instance-name system services ...]
```

Description

Enable a DHCPv4 or DHCPv6 local server to support individual leasequery operations by listening on the UDP socket and responding to leasequery requests received on UDP connections.

Options

restricted-requestor Specify that the DHCP local server responds to an individual leasequery request by sending the binding information to restricted requestors only. This ensures that the requestor is the originator of the binding.

Restricted requestors are determined as follows:

- For DHCPv4 individual leasequery requests, the giaddr of the requestor must match the giaddr of the client.
- For DHCPv6 individual leasequery requests, the requestor's client ID in the bulk leasequery message must match the relay ID sent during binding creation.

> **NOTE**: The `restricted-requestor` statement is not supported for the DHCPv6 `allow-leasequery` statement.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.1.

RELATED DOCUMENTATION

Configuring and Using DHCP Individual Leasequery

Configuring and Using DHCP Bulk Leasequery

allow-maximum (Multicast)

IN THIS SECTION

- Syntax | 2193
- Hierarchy Level | 2193
- Description | 2193
- Default | 2194
- Required Privilege Level | 2195
- Release Information | 2195

Syntax

```
allow-maximum;
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-instances routing-instance-name routing-
options multicast forwarding-cache],
[edit logical-systems logical-system-name routing-options multicast forwarding-cache],
[edit routing-instances routing-instance-name routing-options multicast forwarding-cache],
[edit routing-options multicast forwarding-cache]
```

Description

Allow the larger of global and family-level threshold values to take effect.

This statement is optional when you configure a forwarding cache or PIM state limits. When this statement is included in the configuration and both a family-specific and a global configuration are present, the higher limits take precedence.

For example:

```
[edit routing-options multicast forwarding-cache]
allow-maximum;
family inet {
    threshold {
        suppress 100;
        reuse 75;
    }
}
family inet6 {
    threshold {
        suppress 600;
        reuse 500;
    }
}
threshold {
    suppress 400;
    reuse 450;
}
```

```
user@host# show multicast forwarding-cache statistics

Instance: master Family: INET
Suppress Threshold                      400
Reuse Value                             400
Currently Used Entries                    0

Instance: master Family: INET6
Suppress Threshold                      600
Reuse Value                             500
Currently Used Entries                    0
```

This statement can be useful in single-stack devices on which IPv4 traffic is expected or IPv6 traffic is expected, but not both.

Default

By default, this statement is disabled.

When this statement is omitted from the configuration, a family-specific forwarding cache configuration and a global forwarding cache configuration cannot be configured together. Either the global-specific configuration or the family-specific configuration is allowed, but not both.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2.

RELATED DOCUMENTATION

allow-reverse-ecmp

IN THIS SECTION

- Syntax | 2201
- Hierarchy Level | 2202
- Description | 2202
- Required Privilege Level | 2202
- Release Information | 2202

Syntax

```
allow-reverse-ecmp
```

Hierarchy Level

```
[edit security flow]
```

Description

Enable ECMP support for reverse traffic. In this case, Junos OS for SRX Series Firewalls and vSRX Virtual Firewall instances use a hash algorithm to determine the interface to use for reverse traffic in a flow. This process is similar to asymmetric routing in which a packet traverses from a source to a destination in one path and takes a different path when it returns to the source.

If you do not enable this feature, the software selects a route in the ECMP set to the incoming interface for reverse traffic, which is the default behavior.

Required Privilege Level

security—To view this in the configuration.

security-control—To add this to the configuration.

Release Information

Statement introduced in Junos OS Release 17.3.

Hierarchy Level

```
[edit system scripts op]
```

Description

Enable the execution of Python op scripts from a remote site.

When you configure the `language python` or `language python3` statement at the `[edit system scripts]` hierarchy level, you can execute local Python scripts on a device running Junos OS. In order to execute Python op scripts from a remote site, you must also configure the `allow-url-for-python` statement.

To verify the integrity of the remote op script before it runs on the device, you can optionally confirm the checksum hash for the script. To determine the checksum, use the `file checksum` operational mode command. When you run the `op url` command you can provide the hash value for that script by using the `key` option. If the calculated and specified values do not match, script execution fails.

> **NOTE**: Starting in Junos OS Release 18.2R2 and 18.3R1, Junos OS supports only the SHA-256 hash function for script checksum hashes. Earlier releases support the *MD5*, *SHA-1*, and SHA-256 hash functions.

The `no-allow-url` statement takes precedence over the `allow-url-for-python` statement; if both statements are configured, you cannot execute Python op scripts from a remote site on the device.

Default

If you do not include the `allow-url-for-python` statement, you cannot execute Python op scripts from a remote site, and the `op url` command generates an error.

Required Privilege Level

maintenance—To view or add this statement in the configuration.

Release Information

Statement introduced in Junos OS Release 16.1R1.

allowed-mac

IN THIS SECTION

- Syntax | 2214
- Hierarchy Level | 2214
- Description | 2214
- Default | 2215
- Options | 2215
- Required Privilege Level | 2215
- Release Information | 2215

Syntax

```
allowed-mac {
                        mac-address-list;
}
```

Hierarchy Level

```
[edit ethernet-switching-options                secure-access-port                interface (all |
interface-name)]
```

Description

Specify particular MAC addresses to be added to the MAC address cache.

NOTE: Although this configuration restricts the addresses that can be added to the MAC address cache, it does not block the switch from receiving Layer 2 control packets—such as Link Layer Discovery Protocol (LLDP) packets—transmitted from MAC addresses that are not specified in the list of allowed MAC addresses. Control packets do not undergo the MAC address check and they are therefore included in the statistics of packets

received. However, they are not forwarded to another destination. They are trapped within the switch.

Default

Allowed MAC addresses take precedence over dynamic MAC values that have been applied with the `mac-limit` statement.

Options

mac-address-list—One or more MAC addresses configured as allowed MAC addresses for a specified interface or all interfaces.

Required Privilege Level

system—To view this statement in the configuration.
system–control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.0.

[edit logical-systems logical-systems-name protocols mpls interface interface-name],
[edit protocols mpls interface interface-name]
```

Description

(MX Series routers only) Enable you to switch an LSP away from a network node using a bypass LSP. This feature could be used in maintenance of active networks when a network device needs to be replaced without interrupting traffic passing through the network. The LSPs can be either static or dynamic.

This statement marks all OAM traffic transiting this interface in preparation for switching the traffic to an alternate path based on the OAM functionality. To switch traffic to the bypass LSP, you then need to configure the `switch-away-lsps` statement.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.2.

[edit routing-instances routing-instance-name forwarding-options dhcp-relay group group-name
overrides],
[edit routing-instances routing-instance-name forwarding-options dhcp-relay group group-name
interface interface-name overrides]
```

Description

Override the DHCP relay agent information option (option 82) in DHCP packets destined for a DHCP server. The use of this option causes the DHCP relay agent to perform one of the following actions, depending on how it is configured:

- If the DHCP relay agent is configured to add option 82 information to DHCP packets, it clears the existing option 82 values from the DHCP packets and inserts the new values before forwarding the packets to the DHCP server.
- If the DHCP relay agent is not configured to add option 82 information to DHCP packets, it clears the existing option 82 values from the packets, but does not add any new values before forwarding the packets to the DHCP server.

Required Privilege Level

ambient-temperature

IN THIS SECTION

- Syntax | 2224
- Hierarchy Level | 2224
- Description | 2224
- Default | 2225
- Options | 2225
- Required Privilege Level | 2226
- Release Information | 2226

Syntax

```
chassis ambient-temperature (25C|40C|55C);
```

Hierarchy Level

```
[edit chassis]
```

Description

Set the chassis ambient temperature and instruct the power manager to allocate power to the line cards according to the ambient temperature value.

On system initialization in a PTX Series router, the power manager reads the ambient temperature and allocates power to the line cards according to the power budget policy at that temperature. If the actual power consumption of any line card exceeds the configured value for more than three minutes, the power manager overrides the configured ambient temperature setting of that line card, and resets its

ambient temperature to the next higher level and reallocates power according to the new temperature setting. All the overshooting line cards remain in the dynamic ambient temperature mode until the next reboot, or until you override the configured ambient temperature with a CLI command. The power manager then resets the power budget of the FRUs according to the configured ambient temperature setting.

> **NOTE**: The `set chassis ambient-temperature` *`temperature`* and `show chassis ambient-temperature` commands are not supported on PTX10004, PTX10008, and PTX10016 routers because their power allocation is based on the default ambient temperature.

When an MX Series router or an EX9200 switch restarts, the system adjusts the power allocation or the provisioned power for the line cards on the basis of the configured ambient temperature. If enough power is not available, a minor chassis alarm is raised. However, the chassis continues to run with the configured ambient temperature. You can configure a new higher ambient temperature only after you make more power available by adding new power supply modules or by taking a few line cards offline. By using the provisioned power that is saved by configuring a lower ambient temperature, you can bring more hardware components online.

For MX960 Universal Routing Platform and the MX2000 line of routers, a maximum operating temperature of 40°C is recommended at an altitude of up to 6000 feet above sea level. The router can operate up to a maximum temperature of 46°C at sea level and can be set accordingly.

> **NOTE**: If ambient temperature is not set, then the line cards are allocated power according to the default ambient temperature.

Default

- MX Series routers—40°C
- PTX Series routers—40°C
- EX9200 switches—40°C
- EX9251 switches—40°C
- EX9253 switches—40°C

Options

25C Set the ambient temperature of the chassis to 25°C

40C Set the ambient temperature of the chassis to 40°C

55C Set the ambient temperature of the chassis to 55°C

> **NOTE**: Starting in Junos OS Evolved Release 19.1R1, the PTX10003-80C routers do not support configuration of the ambient temperature value 55C.

Required Privilege Level

chassis—To view this statement in the configuration.

chassis-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.1.

            vlan (vlan-id | vlan-name);
        }
    }
}
```

Hierarchy Level

For platforms without ELS:

```
[edit ethernet-switching-options]
```

For platforms with ELS:

```
[edit forwarding-options]
```

Description

Configure port mirroring. You can create a total of four port-mirroring configurations on the QFX Series, subject to the following limits:

- There can be no more than two configurations that mirror ingress traffic.
- There can be no more than two configurations that mirror egress traffic.

Default

Port mirroring is disabled and Junos OS creates no default analyzers.

Options

`all`—Mirror all the access interfaces. Using this option does not cause the QSFP+ or management interfaces to be mirrored.

> **CAUTION**: Configuring the `all` option in a QFabric system causes all the access interfaces on all the nodes to be mirrored. Be cautious about using this option on a QFabric system.

`analyzer-name`—Name of the analyzer. The name can include as many as 125 characters; must begin with a letter; and can include uppercase letters, lowercase letters, numbers, dashes, and underscores. No other special characters are allowed.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.1.

Option `output vlan` added in Junos OS Release 12.1 for the QFX Series.

Option `output ip-address` added in Junos OS Release 12.3 for the QFX Series for non-ELS platforms and added in 14.1X53-D10 for ELS platforms.

Statement introduced for the “Interface Privilege Level” in Junos OS Release 13.2X50-D10.

anchor-point (Pseudowire Subscriber Interfaces)

IN THIS SECTION

- Syntax | 2244
- Hierarchy Level | 2244
- Description | 2244
- Options | 2246
- Required Privilege Level | 2246
- Release Information | 2246

Syntax

```
anchor-point lt-device;
```

Hierarchy Level

```
[edit interfaces ps0]
```

Description

Specify the anchor-point, a logical tunnel (lt) interface that identifies the logical tunnel interface that terminates the MPLS pseudowire tunnel at the access node. The other end of the tunnel terminates on

the pseudowire subscriber logical interface, which is configured on an MX Series router that hosts subscriber management and enables you to perform subscriber management services at the interface.

The pseudowire is a virtual device that is stacked above the logical tunnel anchor point on the physical interface (the IFD), and supports a circuit-oriented Layer 2 protocol (either Layer 2 VPN or Layer 2 circuit). The Layer 2 protocol provides the transport and service logical interfaces, and supports the protocol family (IPv4, IPv6, or PPPoE).

NOTE: You cannot dynamically change an anchor point that has active pseudowire devices stacked above it. If you need to change such an anchor point, you must perform the following steps:

1. Deactivate the stacked pseudowires and commit. This may require bringing down any subscribers using the pseudowires.

```
[edit interfaces]
user@host# deactivate psnumber
user@host# commit
```

2. Change the anchor on the deactivated pseudowire and commit.

```
[edit interfaces]
user@host# set psnumber anchor-point lt-new-lt-interface-number
user@host# commit
```

3. Reactivate the stacked pseudowires and commit.

```
[edit interfaces]
user@host# activate psnumber
user@host# commit
```

NOTE: You cannot disable the underlying logical tunnel (lt) interface or redundant logical tunnel (rlt) interface when a pseudowire is anchored on that interface. If you want to disable the underlying interface, you must first deactivate the pseudowire.

1. Deactivate the stacked pseudowires and commit. This may require bringing down any subscribers using the pseudowires.

```
[edit interfaces]
user@host# deactivate psnumber
user@host# commit
```

2. Disable the underlying interface and commit.

```
[edit interfaces]
user@host# set interfaces underlying-interface-name disable
user@host# commit
```

Options

lt-device An lt device in the format `lt-`*fpc/pic/port*

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.1.

    priority priority;
    algorithm algorithm;
}
```

Hierarchy Level

```
[edit class-of-service adjustment-control-profiles profile-name application]
```

Description

Configure the shaping rate adjustment controls for the ANCP application.

Options

priority Priority of the ANCP application in the adjustment control profile.

- **Range:** 1 through 10; 1 being the highest priority.
- **Default:** 1

algorithm Rate adjustment algorithm used by the ANCP application.

- Values:
  - adjust-never—Do not perform rate adjustments.
  - adjust-always—Adjust the shaping rate unconditionally.
  - adjust-less—Adjust the shaping rate if it is less than the configured value.
  - adjust-less-or equal—Adjust the shaping rate if it is less than or equal to the configured value.
  - adjust-greater—Adjust the shaping rate if it is greater than the configured value.
  - adjust-greater-or-equal—Adjust the shaping rate if it is greater than or equal to the configured value.
- **Default:** adjust-always

annotate

IN THIS SECTION

- Syntax | 2253
- Description | 2253
- Options | 2253
- Required Privilege Level | 2253
- Release Information | 2254

Syntax

```
annotate <statement> <comment string>
```

Description

Add comments to a configuration. You can add comments only at the current hierarchy level.

Any comments you add appear only when you view the configuration by entering the "show" on page 16994 command in configuration mode or the `show configuration` command in operational mode.

NOTE: The software supports annotation up to the last level in the configuration hierarchy, including oneliners. However, annotation of parts (child statements or identifiers within a oneliner) of the oneliner is not supported. For example, in the following sample configuration hierarchy, annotation is supported up to the oneliner level 1 , but not supported for the metric child statement and its attribute *10*:

```
[edit protocols]
    isis {
        interface ge-0/0/0.0 {
            level 1 metric 10;
        }
    }
}
```

Options

statement Statement to which you are attaching the comment.

comment-string Text of the comment. You must enclose it in quotation marks. In the comment string, you can include the comment delimiters `/* */` or `#`. If you do not specify any, the comment string is enclosed with the `/* */` comment delimiters. If a comment for the specified *statement* already exists, it is deleted and replaced with the new comment.

Required Privilege Level

configure—To enter configuration mode, but other required privilege levels depend on where the statement is located in the configuration hierarchy.

Release Information

Command introduced before Junos OS Release 7.4.

anti-replay-window-size

IN THIS SECTION

- Syntax | 2255
- Hierarchy Level | 2256
- Description | 2256
- Required Privilege Level | 2256
- Release Information | 2256

Syntax

```
anti-replay-window-size anti-replay-window-size;
```

Hierarchy Level

```
[edit security ipsec],
[edit tenants name security ipsec]
```

Description

To enable the `anti-replay-window-size` option, you first need to configure the option for each VPN object or at the global level. You can configure the anti-replay window size in the range of 64 to 8192 (power of 2). If the anti-replay window size is not configured, the window size is 64 by default. If `anti-replay-window-size` command is configured at both the global and VPN object levels, the configuration on VPN object takes precedence over global configuration.

Note that you can increase the anti-replay window size if your device runs the IPsec VPN service using the IKED process. Devices running the KMD process do not support this feature.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 19.2R1.

RELATED DOCUMENTATION

Anti-Replay Window

anti-replay-window-size (Services IPsec VPN)

IN THIS SECTION

Syntax | 2257

- Hierarchy Level | 2257

- Required Privilege Level | 2257
- Release Information | 2257

Syntax

```
anti-replay-window-size bits;
```

Hierarchy Level

```
[edit services ipsec-vpn rule rule-name term term-name then]
```

Description

Specify the size of the IPsec antireplay window.

Options

bits—Size of the antireplay window, in bits.

- **Default:** 64 bits (AS PICs), 128 bits (Multiservices PICs and DPCs)
- **Range:** 64 through 4096 bits

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.0.

anti-replay-window-size (Services Service Set)

IN THIS SECTION

- Syntax | 2258
- Hierarchy Level | 2258
- Description | 2258
- Options | 2259
- Required Privilege Level | 2259
- Release Information | 2259

Syntax

```
anti-replay-window-size bits;
```

Hierarchy Level

```
[edit services service-set service-set-name ipsec-vpn-options]
```

Description

Specify the size of the IPsec antireplay window. This statement is useful for dynamic endpoint tunnels for which you cannot configure the `anti-replay-window-size` statement at the `[edit services ipsec-vpn rule rule-name term term-name then]` hierarchy level.

For static IPsec tunnels, this statement sets the antireplay window size for all the static tunnels within this service set. If a particular tunnel needs a specific value for antireplay window size, set the `anti-replay-window-size` statement at the `[edit services ipsec-vpn rule rule-name term term-name then]` hierarchy level. If antireplay check has to be disabled for a particular tunnel in this service set, set the `no-anti-replay` statement at the `[edit services ipsec-vpn rule rule-name term term-name then]` hierarchy level.

> **NOTE**: The `anti-replay-window-size` and `no-anti-replay` settings at the `[edit services ipsec-vpn rule rule-name term term-name then]` hierarchy level override the settings specified at the `[edit services service-set service-set-name ipsec-vpn-options]` hierarchy level.

Options

bits—Size of the antireplay window, in bits.

- **Default:** 64 bits (AS PICs), 128 bits (Multiservices PICs and DPCs)
- **Range:** 64 through 4096 bits

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.0.

```

Description

Configures the Content Security antispam feature for logical systems. The antispam feature examines transmitted e-mail messages to identify e-mail spam. When the device detects a message deemed to be spam, it blocks the e-mail message or tags the e-mail message header or subject with a preprogrammed string. Antispam filtering uses both a third-party server-based Spam Block List (SBL), and optionally created local allowlists (benign) and blocklists (malicious) for filtering against e-mail messages.

You can also configure the default Content Security configuration for antispam feature profile. If you do not configure any option in the antispam feature profile, the values configured in the default Content Security configuration are applied. In the default Content Security profile, the antispam type is configured as SBL instead of none. This configuration enables the SBL option. However, to use this

feature, enable the SBL server using the `[edit security utm default-configuration anti-spam sbl sbl-default-server]` command.

> **NOTE**: A license check for the antispam configuration is performed at the time of commit and provides a warning if a valid license is not installed on the device. Once a valid license is installed on the device then the custom antispam profile or the default antispam profile is able to process the traffic. If a license is expired or is not installed, the antispam service does not process the traffic.

Options

anti-spam	Configures the Content Security antispam feature for logical system.
address-blacklist	Enter an address blocklist custom object for local list spam filtering.
address-whitelist	Enter an address allowlist custom object for local list spam filtering.
sbl	Antispam filtering allows you to use both a third-party server-based SBL, and optionally created local allowlists and blocklists for filtering against e-mail messages.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 18.3R1.

Support for configuration in tenant systems introduced in Junos OS Release 19.2R1.

Description

Configure Content Security antispam features. You can also configure the default Content Security configuration for antispam feature profile. If you do not configure any option in the antispam feature profile, the values configured in the default Content Security configuration are applied.

The antispam feature examines transmitted e-mail messages to identify e-mail spam. When the device detects a message deemed to be spam, it blocks the e-mail message or tags the e-mail message header or subject with a preprogrammed string. Antispam filtering uses both a third-party server-based Spam Block List (SBL) and optionally created local allowlists (benign) and blocklists (malicious) for filtering against e-mail messages.

> **NOTE**: A license check for the antispam configuration is performed at the time of a commit and will provide a warning if a valid license is not installed on the device. Once a valid license is installed on the device then a custom antispam profile or the default profile will be able to process traffic. If a license is expired or is not installed, the antivirus service will not process traffic.

In the default Content Security profile, the antispam type is configured as SBL instead of none. This configuration enables SBL. However, to use this feature, you must enable the SBL server using the `[edit security utm default-configuration anti-spam sbl sbl-default-server]` command.

Starting in Junos OS Release 23.1R1, we've introduced the `server` statement at the `[edit security utm default-configuration anti-spam sbl]` hierarchy level to configure the SBL server details for antispam. Earlier to Junos OS Release 23.1R1, the antispam and antivirus used the same `server` statement at [edit security Content Security default-configuration anti-virus sophos-engine] hierarchy level for the SBL server configuration. For antispam, it is recommended to configure SBL server at the `[edit security utm default-configuration anti-spam sbl server]` hierarchy level rather than at the `[edit security utm default-configuration anti-virus sophos-engine server]` hierarchy level.

Starting in Junos OS Release 23.1R1, content security supports antivirus Sophos Live Protection version 2.0. The new version of Sophos antivirus uses HTTPS connection instead of DNS transport channel for device to server communication. Hence, we've deprecated the `ip` statement at the `[edit security utm default-configuration anti-virus sophos-engine server]` hierarchy level.

Options

anti-spam	Configure antispam feature.
address-blacklist	Enter an address blocklist custom object for local list spam filtering.
address-whitelist	Enter an address-allowlist custom-object for local list spam filtering.
ip	Specify the antispam first-hop DNS server IP address.
routing-instance	Specify the name of the routing instance.
sbl	Antispam filtering allows you to use both a third-party server-based spam block list (SBL) and to optionally create your own local allowlists and blocklists for filtering against e-mail messages.
traceoptions	Defines tracing operations for Content Security antispam features.
source-address	Specify the source IP address used to connect SBL server.
type	Antispam type.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

security—To view this statement in the configuration.

[edit tenants tenant-name security utm utm-policy policy-name]
```

Description

Configures a Content Security policy for the antispam SMTP protocol and attach this policy to a security profile to implement it. The device can block and drop detected spam at either the connection level or the e-mail level. When the SMTP sender is identified as a spam sender based on its IP address, the SMTP connection is rejected and dropped. When a particular e-mail sender is identified as spam sender based on its sender address, the e-mail is rejected and dropped.

```
[edit security utm feature-profile]
[edit security utm default-configuration]
```

Description

Configure Content Security Sophos antivirus features. You can also configure the default Content Security configuration for antivirus feature profile. If you do not configure any option in the antivirus feature profile, the values configured in the default Content Security configuration are applied. Antivirus, one of several features including content filtering, antispam, and Web filtering, makes up Juniper's Content Security suite, provides the ability to prevent threats at the gateway before they enter the network.

> **NOTE**: A license check for the antivirus configuration is performed at the time of a commit and will provide a warning if a valid license is not installed on the device. Once a valid license is installed on the device then a custom antivirus profile or the default profile will be able to process traffic. If a license is expired or is not installed, the antivirus service will not process traffic.

Options

`anti-virus`	Configure antivirus feature.
`mime-whitelist`	This is the comprehensive list for those MIME types that can bypass antivirus scanning.
`sophos-engine`	The antivirus engine that is used on the device. You can only have one engine type running and you must restart the device if you change engines.
`fallback-options`	Fallback options tell the system how to handle the errors.
`notification-options`	There are multiple notification options you can configure to trigger when a virus is detected.
`fallback-non-block`	Notifications for fallback nonblocking actions.
`virus-detection`	Notification to send when a virus is detected.
`pattern-update`	You can configure the security device to regularly update the pattern file automatically, or you can update the file manually.
`scan-options`	Antivirus sophos-engine scan options.
`server`	Sophos Antivirus (SAV) and antispam first hop DNS server.
`sxl-retry`	Number of retry attempts to the remote Sophos Extensible List (SXL) server when a request timeout occurs.

- **Range:** 0 through 5

`sxl-timeout` Timeout value for responses to a Sophos checksum or URI query.

- **Range:** 1 through 5

`trickling` HTTP trickling is a mechanism used to prevent the HTTP client or server from timing-out during a file transfer or during antivirus scanning.

`traceoptions` Define tracing operations for Content Security antivirus features.

`url-whitelist` Antivirus URL allowlist. A URL allowlist is a unique custom list that you define in which all the URLs or IP addresses in that list for a specified category are always bypassed for scanning.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

The Express and Kaspersky antivirus feature is not supported from Junos OS Release 15.1X49-D10 onwards. For previous releases, statement introduced in Junos OS Release 9.5.

The `[edit security utm default-configuration]` hierarchy level is introduced in Junos OS Release 18.2R1.

anti-virus (Content Security Policy)

Description

Use this command to configure flow-based antivirus policy and machine learning scan. After configuring the antivirus policy, you must apply it to the network firewall policy using the `set security policies from-zone from-zone to-zone to-zone policy policy-name then permit application-services anti-virus-policy av-policy` command.

Options

policy Configure the antivirus policy details.

- policy-name—Name of the antivirus policy.
- action—Action taken when file meets verdict threshold.
- default-notification—Notification log when file does not meet the verdict threshold.

fallback-options Defines what to do when error conditions occur or when there is a lack of resources. The following fallback options are available:

- action—Permit or block the file regardless of its threat level.
- invalid-content-size—Permit or block the file when content size exceed supported range
- out-of-resources—Permit or block the file when service is out of resources
- service-not-ready—Permit or block the file when service is not yet ready
- notification—Add or do not add this event to the log file.

http-client-notify

(message | file | redirect-url) Notification action taken for contents with verdict meet threshold. This command allows you to configure HTTP URL redirection for a customized client notification based on detected virus with the block action.

machine-learning-scan

Configure the machine learning scan options.

- action—Permit or block the file regardless of its threat level.
- apply-groups—Groups that these machine learning scan settings apply.
- apply-groups-except—Groups that these machine learning scan settings do not apply.
- default-notification—Notification log when file does not meet the verdict threshold.
- notification—Add or do not add this event to the log file.

verdict-threshold

The verdict-threshold defines the number at which you want to label a file as virus. For example, if you set verdict-threshold to 7, then any file with verdict number of 7 or greater is considered virus. verdict-threshold can be any number between 1 and 10, inclusive.

traceoptions

Configure anti-virus trace options. When the trace is set in the configuration, the “flags” are defined for the actual debug that you want to perform. This command allows you to trace the antivirus configuration and is typically used for troubleshooting.

- apply-groups name—Groups that these trace option settings apply.
- apply-groups-except name—Groups that these trace option settings do not apply.
- file— Defines the trace file characteristics. Valid options are:
  - trace-file-name—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory /var/log. Valid values range from 1 and 1024 characters. The name cannot include spaces, /, or % characters. The default filename is security.

  - files—Maximum number of trace files that can accumulate. Valid values range from 2 to 1000. The default value is 3.
  - match—The criteria that you want the system to use when logging information to the file. You can enter a regular expression. Wildcard (*) characters are accepted.
  - no-world-readable—Only the system administrator can read the trace file.
  - size—Maximum size to which the trace file can grow. Once the file reaches the specified size, it is compressed and renamed filename0.gz, the next file is named filename1.gz, and so on. Valid values range from 10240 to 1,073,741,824.
  - world-readable—Any user can read the trace file.
- flag—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:
  - all—Trace everything.
  - content—Trace the content the SRX is buffering to the client and to the cloud.
  - daemon—Trace the Juniper Advanced Threat Prevention Cloud (ATP Cloud) daemon.
  - http—Trace HTTP protocol operations
  - identification—Trace the file type identification. Examples of file types are .exes, .java, .tar and so forth.
  - imap—Trace IMAP protocol operations
  - parser—Trace the interface between the Juniper ATP Cloud daemon and the module that parses the HTTP protocol and extracts the file content.
  - plugin—Trace the Juniper ATP Cloud plugin to view session checks, packet processing and actions taken against a file or URL.
  - policy—Trace the Juniper ATP Cloud security policy.
  - smb—Trace SMB protocol operations
  - smtp—Trace SMTP protocol operations
- level—Specify level of tracing to perform. The option you configure enables tracing of events at that level and all higher (more restrictive) levels. You can specify any of the following levels:

- all—Match messages of all levels.
- error—Match error conditions.
- info—Match informational messages.
- notice—Match notice messages about conditions requiring special handling.
- verbose—Match verbose messages. This is the lowest (least restrictive) severity level; when you configure verbose, messages at all higher levels are traced. Therefore, the result is the same as when you configure all.
- warning—Match warning messages.

- no-remote-trace—Disable remote tracing.

update Configure antivirus package download and install options.

- automatic— Scheduled download and install.
- interval—Schedule automatic download interval in minutes . Range is 5 to 60 minutes.
- off—Disable automatic antivirus download and install.
- ignore-server-validation—Do not check server certificate.
- proxy profile—Configure proxy profile.
- url—HTTP/HTTPS URL of antivirus package download.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 23.4R1.

The `machine-learning-scan` option is introduced in Junos OS Release 24.2R1.

[edit routing-instances routing-instance-name protocols rip group group-name neighbor neighbor-
name]
```

Description

Disable strict sender address checks.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.0.

any (VPLS Multihoming)

IN THIS SECTION

- Syntax | 2282
- Hierarchy Level | 2282
- Description | 2283
- Default | 2283
- Required Privilege Level | 2283
- Release Information | 2283

Syntax

```
any;
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-instances instance-name protocols vpls multi-
homing active-interface],
[edit logical-systems logical-system-name routing-instances instance-name protocols vpls multi-
homing site site-name active-interface],
[edit routing-instances instance-name protocols vpls multi-homing active-interface],
[edit routing-instances instance-name protocols vpls multi-homing site site-name active-
interface]
```

Description

Specify that any multihomed interface can be used as the primary interface by the VPLS site. Depending on the order in which interfaces are listed in the PE router's configuration, the first operational interface in the set of configured interfaces is chosen to be the primary interface.

> **NOTE**: In the VPLS documentation, the word *router* in terms such as *PE router* is used to refer to any device that provides routing functions.

For FEC 128, use the `[edit routing-instances instance-name protocols vpls multi-homing active-interface]` hierarchy level.

Default

This is the default behavior.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 7.5.

anycast-prefix

IN THIS SECTION

- Syntax | 2285
- Hierarchy Level | 2285
- Description | 2285
- Default | 2286
- Options | 2286
- Required Privilege Level | 2286
- Release Information | 2286

Syntax

```
anycast-prefix ip-prefix/<prefix-length>;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols amt relay family inet],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols amt
relay family inet],
[edit protocols amt relay family inet],
[edit routing-instances routing-instance-name protocols amt relay family inet]
```

Description

Specify an IP address prefix to use for the Automatic Multicast Tunneling (AMT) relay anycast address. The prefix is advertised by unicast routing protocols to route AMT discovery messages to the router from nearby AMT gateways. The IP address that the prefix is derived from can be configured on any

interface in the system. Typically, the router's **lo0.0** loopback address prefix is used for configuring the AMT anycast prefix in the default routing instance, and the router's **lo0.*n*** loopback address prefix is used for configuring the AMT anycast prefix in VPN routing instances. However, the anycast address can be either the primary or secondary **lo0.0** loopback address.

Default

None. The anycast prefix must be configured.

Options

ip-prefix/<prefix-length>—IP address prefix.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.2.

Configuring the AMT Protocol

apn

IN THIS SECTION

- Syntax | 2287
- Hierarchy Level | 2287
- Description | 2287
- Options | 2287
- Required Privilege Level | 2288

Release Information | 2288

Syntax

```
apn pattern-string {
    imsi-prefix imsi-prefix-digits {
        action (APN GTP) {
            drop;
            pass;
            selection (ms|net|vrf);
        }
    }
}
```

Hierarchy Level

```
[edit security gtp profile profile-name]
```

Description

Use the APN function to allow or deny access to specific access point names (APNs). By default, the device permits all APNs. To enable APN filtering, you must specify one or more APNs. To specify an APN, you need to know the domain name of the network (for example, example.com) and, the operator ID. Because the domain name (network ID) portion of an APN can potentially be very long and contain many characters, you can use the wildcard (*) as the first character of the APN string.

From Junos OS Release 20.4R1 onwards, the `[edit security gprs gtp profile profile-name]` hierarchy level is replaced by `[edit security gtp profile profile-name]`.

Options

- *pattern-string*—To specify APN pattern string, such as “example.net.mcc123.mnc456.gprs”.
- *imsi-prefix-digits*—To specify an IMSI prefix.

  The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.0. Support.

Syntax

```
apn-control-group <apn-ctrl-grp-name>
```

Hierarchy Level

```
[edit security gtp]
```

Description

Use this configuration to group all the APNs with the same rate limiting requirements and apply the group to the GTP profile.

Release Information

Statement introduced in Junos OS Release 21.2R1.

RELATED DOCUMENTATION

Understanding GTP APN Filtering

apn-control (Security GTP)

IN THIS SECTION

- Syntax | 2289
- Hierarchy Level | 2290
- Description | 2290
- Options | 2290
- Release Information | 2291

Syntax

```
apn-control  apn-ctrl-name
{ apn apn-string}
{rate-limit
  {alarm-threshold threshold}
   {drop-threshold threshold}
    { message <v0msg-list-name|v1msg-list-name|v3msg-list-name>}
}
```

Hierarchy Level

```
[edit security gtp]
```

Description

Use this command to configure APN control profile using APN string. You can apply the APN control profile to GTP profile for ARL.

Options

- `Apn` *apn-string*—You can specify APN using APN string. APN string consists of Network Identifier (NI) and Operator Identifier (OI). You can specify APN in the below formats:
  - <NI>: for example internet, internet.public
  - <NI>.<OI>: for example internet.mnc005.mcc244.gprs, internet.public.mnc005.mcc244.gprs

  APN string configuration supports wild card "*" in place of OI. You can specify APN as <NI>."*" and configure the matching APN string. You don't need to specify the OI when you configure APN using wild card "*".

  Range–The length range of the apn-string is 1 through 100.

- `rate-limit`—Use the rate-limit option to limit the GTP messages per second. Once the threshold is reached, this configuration either drops the messages or raises an alarm.
  - `alarm-threshold` *threshold*–This configuration raises an alarm when the apn-messages per second reaches the threshold.

    Range:–1 through 80000

  - `drop-threshold`–This configuration drops the apn-messages when the apn-messages per second reaches the threshold.

    Range:–1 through 80000

  - `message <v0|v1|v2>`–This configuration rate-limits the messages using message type specified in the message-list. You can configure any message type in a message list. While applying the message-list to APN control profile, make sure that the message type configured in the list is a GTP-C message which is related to a GTP session context.

    If the message-lists are not configured, aggregated rate limit uses the default messages.

Table 2: Default aggregated rate limit messages for various GTP versions.

GTP version	Default aggregated rate limit messages
GTPv0	Create PDP Request
	Create AA PDP Request
	Update PDP Request
	Delete PDP Request
	Delete AA PDP Request
GTPv1	Create PDP Request
	Update PDP Request
	Delete PDP Request
GTPv2	Create Session Request
	Create Bearer Request
	Modify Bearer Request
	Delete Session Request
	Delete Bearer Request

appfw-profile (System)

IN THIS SECTION

- Syntax | 2295
- Hierarchy Level | 2295
- Description | 2295
- Options | 2295
- Required Privilege Level | 2295
- Release Information | 2296

Syntax

```
appfw-profile {
    maximum amount;
    reserved amount;
}
```

Hierarchy Level

```
[edit security application-firewall profile profile-name]
[edit tenants tenant-name security application-firewall]
```

Description

Specify the application firewall profile quota of a logical system and tenant systems.

As a primary administrator, you can create a security profile and specify the kinds and amounts of resources that are to be allocated to a logical system to which the security profile is bound. A security profile is used for share the device resources, including policies, zones, addresses and address books, flow sessions, and various forms of NAT, among all the logical systems appropriately. You can dedicate various amounts of a resource to the logical systems and also allow the logical systems to compete for use of the free resources.

Options

- `maximum` *`amount`*—Specify the maximum allowed quota value.

  `Range`: 0 through 1024

- `reserved` *`amount`*—Specify a reserved quota value that guarantees that the resource amount specified is always available to the logical system.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.4.

The `edit tenant tenant-name security application-firewall` level is introduced in Junos OS Release 18.4R1.

Application Firewall Overview

appfw-rule

IN THIS SECTION

- Syntax | 2296
- Hierarchy Level | 2296
- Description | 2297
- Options | 2297
- Required Privilege Level | 2297
- Release Information | 2297

Syntax

```
appfw-rule {
    maximum amount;
    reserved amount;
}
```

Hierarchy Level

```
[edit system security-profile security-profile-name ]
[edit tenants tenant-name security application-firewall ]
```

Description

Specify the number of application firewall rule configurations that a primary administrator can configure for a primary logical system or user logical system, when the security profile is bound to the logical systems and tenant systems.

Tasks performed by the primary administrator are:

- Uses security profiles to provision logical systems with resources.
- Binds security profiles to the primary logical system and the user logical systems.
- Configures more than one security profile, and allocating different numbers of resources in various profiles.

Only the primary administrator can create security profiles and bind them to logical systems.

Options

- `maximum` *`amount`*—A maximum allowed quota. If a logical system requires more of a resource than its reserved amount allows, it can use resources configured for the global maximum amount if they are available—that is, if they are not allocated to other logical systems. The maximum allowed quota specifies the portion of the free global resources that the logical system can use. The maximum allowed quota does not guarantee that the amount specified for the resource in the security profile is available. Logical systems compete for global resources.
- `reserved` *`amount`*—A reserved quota that guarantees that the resource amount specified is always available to the logical system.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.4.

The `edit tenant` *`tenant-name`* `security application-firewall` level is introduced in Junos OS Release 18.4R1.

```

Hierarchy Level

```
[edit system security-profile security-profile-name ]
[edit tenants tenant-name security application-firewall]
```

Description

Specify the number of application firewall rule set configurations that a primary administrator can configure for a primary logical system or user logical system when the security profile is bound to the logical systems and tenant systems.

The primary administrator:

- Uses security profiles to provision logical systems with resources
- Binds security profiles to the primary logical system and the user logical systems

- Can configure more than one security profile, allocating different numbers of resources in various profiles

Only the primary administrator can create security profiles and bind them to logical systems.

Options

- `maximum` *`amount`*—A maximum allowed quota. If a logical system requires more of a resource than its reserved amount allows, it can use resources configured for the global maximum amount if they are available—that is, if they are not allocated to other logical systems. The maximum allowed quota specifies the portion of the free global resources that the logical system can use. The maximum allowed quota does not guarantee that the amount specified for the resource in the security profile is available. Logical systems compete for global resources.
- `reserved` *`amount`*—A reserved quota that guarantees that the resource amount specified is always available to the logical system.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.4.

The `edit tenant` *`tenant-name`* `security application-firewall` level is introduced in Junos OS Release 18.4R1.

[edit services application-identification]
```

Description

Configure application definition.

You can create custom application signatures by specifying a name, protocol, port where the application runs, and match criteria. You can create ICMP-based, address-based, IP protocol-based, and Layer 7-based custom application signatures. Custom applications are created to to identify applications over Layer 7 and transiting or temporary applications, and to achieve further granularity of known applications.

Custom application definitions can be used for applications that are not part of the Juniper Networks predefined application database.

Options

application *application-name*

Name of the custom application signature. Must be a unique name with a maximum length of 63 characters.

> **NOTE**: Application names are case insensitive.

cacheable Enable caching of application identification results. By enabling this option, you can cache the application detection result in an ASC table. If there is an entry in the ASC table, based on the destination IP address, protocol, and the port, we can identify AppID without again sending packet to engine. This option is not supported for address-based, IP protocol-based, and ICMP-based custom application signatures.

description Description of the application.

priority Priority of custom applications over the predefined applications.

- **Values:** high

order *number* Specify the order for the custom application. Lower order has higher priority. This option is used when multiple custom applications of the same type match the same traffic. However, you cannot use this option to prioritize among different type of applications such as TCP stream-based applications against TCP port-based applications or IP address-based applications against port-based applications.

priority [high | low] Specify the priority over other signature applications.

type Specify if application is a well-known application such as HTTP and FTP.

risk Custom application risk value should range from 1 to 5 to keep in sync with the predefined applications. The default value is 1 when the risk is not configured. Configuring risk value for custom application signatures is not supported.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

trace—To view this statement in the configuration.

trace-control—To add this statement to the configuration.

Hierarchy Level

```
[edit applications]
```

Description

Configure application properties at the [applications] hierarchy level.

Options

- `application-protocol` *`protocol-name`*—Specify the name of the application protocol.
- `description` *`text`*—Describe the application.
- `destination-port` *`port-identifier`*—Specify a TCP or UDP destination port number.
- `do-not-translate-A-query-to-AAAA-query`—Set the statement to control the translation of A query to AAAA query.
- `do-not-translate-AAAA-query-to-A-query`—Set the statement to control the translation of AAAA query to A query.

- `ether-type` *`value`*—Specify the Ethernet packet type value.
- `icmp-code` *`value`*—Specify the Internet Control Message Protocol (ICMP) code value.

  Range: 0 through 255.
- `icmp-type` *`value`*—Specify the ICMP packet type value.

  Range: 0 through 255.
- `icmp6-code` *`value`*—Specify the ICMP6 code value.

  Range: 0 through 255.
- `icmp6-type` *`value`*—Specify the ICMP6 packet type value.

  Range: 0 through 255.
- `inactivity-timeout (`*`seconds`*` | never)`—Specify the amount of time the application is inactive before it times out in seconds.

  Range: 4 through 129,600 seconds.

  Default: For TCP, 1800 seconds; for UDP, 60 seconds.
- `protocol` *`value`*—Specify the networking protocol name or number.
- `rpc-program-number` *`value`*—Specify the remote procedure call (RPC) or Distributed Computing Equipment (DCE) value.
- `source-port` *`port-number`*—Specify a TCP or UDP source port number.
- `term` *`term-name`*—Specify the individual application protocol.
  - `alg` *`application`*—Specify the name of the application protocol.
  - `destination-port` *`port-identifier`*—Specify a TCP or UDP destination port number.
  - `icmp-code` *`value`*—Specify the ICMP code value.

    Range: 0 through 255.
  - `icmp-type` *`value`*—Specify the ICMP packet type value.

    Range: 0 through 255.
  - `icmp6-code` *`value`*—Specify the ICMP6 code value.

    Range: 0 through 255.
  - `icmp6-type` *`value`*—Specify the ICMP6 packet type value.

Range: 0 through 255.

- `inactivity-timeout (seconds | never)`—Specify the amount of time the application is inactive before it times out in seconds.

  Range: 4 through 129,600 seconds.

  Default: For TCP, 1800 seconds; for UDP, 60 seconds.

- `protocol number`—Specify the networking protocol name or number.
- `rpc-program-number number`—Specify the RPC or DCE value.
- `source-port port-number`—Specify a TCP or UDP source port number.
- `uuid hex-vale`—Specify the universal unique identifier (UUID) for objects.

- `uuid hex-value`—Specify the UUID for objects.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

application-bypass (Juniper Secure Connect)

IN THIS SECTION

- Syntax | 2314
- Hierarchy Level | 2314
- Description | 2314
- Options | 2315
- Required Privilege Level | 2315
- Release Information | 2315

Syntax

```
application-bypass {
    term name {
        description description;
        protocol protocol;
        domain-name domain-name
     }
}
```

Hierarchy Level

```
[edit security remote-access client-config name]
```

Description

Define Juniper Secure Connect remote client configuration parameters for bypassing certain applications based on domain names and protocols without passing through the remote access VPN tunnel. Administrator configures these parameters on the SRX Series Firewall which are pushed to client application after its successful authentication.

Options

application-bypass Define application-bypass configuration.

term Define an application-bypass entry; specify a term *name*.

- Values:
  - Format: Must be a string beginning with a number or letter and consisting of letters, numbers, dashes and underscores. Supports upto 50 term entries.

description Text description of remote-access application-bypass profile

domain-name Specify domain-name to bypass VPN tunnel.

- Values:
  - `contains`—Match any domain name containing the suffix value. Example: *example.com*.
  - `fqdn`—Match fully qualified domain name. Example: *hr.example.com*.
  - `wildcard`—Match any subdomain. Example: *.example.com*.

protocol Specify protocol to bypass VPN tunnel

- Values:
  - `all`—Bypass both TCP and UDP traffic.
  - `tcp`—Bypass only TCP traffic.
  - `udp`—Bypass only UDP traffic.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 23.1R1.

        }
        flag flag;
        no-remote-trace;
    }
}
```

Hierarchy Level

```
[edit security]
```

Description

Specify the profile options, rule set and rule specifications, and trace options to be used for application firewall implementations.

You can configure the application firewall by defining a collection of rule sets. These rule sets can be defined independently and shared across network security policies. A rule set defines the rules that match the application ID detected, based on the application signature.

The application firewall support in the security policies provides additional security control for dynamic applications.

Starting in Junos OS Release 18.2R1, the application firewall (AppFW) functionality is deprecated. As a part of this change, the `[edit security application-firewall]` hierarchy and all the configuration options under this hierarchy are deprecated— rather than immediately removed—to provide backward compatibility and an opportunity to bring your configuration into compliance with the new configuration.

Options

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.1. Updated with the `ssl-encryption` and `reject` options in Junos OS Release 12.1X44-D10. Updated with the `block-message` option in Junos OS Release 12.1X45-D10.

The `tenant` option is introduced for Junos OS Release 18.4R1.

    rule-set rule-set-name;
}
```

Hierarchy Level

```
[edit security policies from-zone zone-name to-zone zone-name policy policy-name then permit
application-services]
```

Description

Specify the rule sets configured as part of application firewall to be applied to permitted traffic in a security policy.

The application firewall is defined by a collection of rule sets. You can implement an application firewall by defining one or more application firewall rule sets and creating rules for each rule set that permit, reject, or deny traffic based on the application ID. These rule sets can be defined independently and shared across network security policies. Then you configure a security policy to invoke the application firewall service and specify the rule set to be applied to permitted traffic.

Starting in Junos OS Release 18.2R1, the application firewall (AppFW) functionality is deprecated. As a part of this change, the `[edit security application-firewall]` hierarchy and all the configuration options under this hierarchy are deprecated— rather than immediately removed—to provide backward compatibility and an opportunity to bring your configuration into compliance with the new configuration.

Options

`rule-set` *`rule-set-name`*—Name of the rule set that contains application firewall specification rules.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Syntax

```
application-group group-name {
    application-groups application-group-name;
    applications application-name;
}
```

Hierarchy Level

```
[edit services application-identification]
```

Description

Configure a custom application group for application identification.

Applications can be grouped under predefined and custom application groups. You can add number of applications or application groups that you want to include in your custom application group.

You can configure an application group to associates related applications under a single name for simplified, consistent reuse in configuring application-based policies.

Options

group-name	Name of the group. This name is used in policy configuration statements in place of multiple predefined applications, user-defined applications, or other groups.
application-groups *application-group-name*	Name of an application group to be assigned to this group. There is no maximum number of groups that can be assigned to a group. Use multiple commands to assign multiple groups.
applications *application-name*	Name of an application to be assigned to this group. An application can remain unassigned or be assigned to a group, but it cannot be assigned to more than one group. There is no maximum number of applications that can be assigned to a group. Use multiple commands to assign multiple groups.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.2.

application-groups (PCC Rules)

IN THIS SECTION

- Syntax | 2327
- Hierarchy Level | 2327
- Description | 2327

- Options | 2327
- Required Privilege Level | 2328
- Release Information | 2328

Syntax

```
application-groups [application-group-name];
```

Hierarchy Level

```
[edit unified-edge pcef pcc-rules rule-name from],
[edit services pcef pcc-rules rule-name from]
```

Description

Specify one or more application groups to define the match criteria for the policy and charging control (PCC) rule. You can specify a maximum of 10 application groups in a PCC rule.

> **NOTE**: You must also include the `flows` statement. If you do not want to filter subscriber traffic based on service data flow filters, use `flows any`.

If you are using Junos OS Subscriber Aware, specify the name of the application group at the `[edit unified-edge pcef pcc-rules rule-name from]` hierarchy level.

If you are using Junos OS Broadband Subscriber Management, specify the name of the application group at the `[edit services pcef pcc-rules rule-name from]` hierarchy level.

Options

application-group-name Name of an application group that is used to detect IP packet flows.

- **Range:** 1 through 63 characters.

NOTE: The referenced application groups must have been previously configured in the `[edit services application-identification]` hierarchy level.

Required Privilege Level

For Junos OS Subscriber Aware:

unified-edge—To view this statement in the configuration.

unified-edge-control—To add this statement to the configuration.

For Junos OS Broadband Subscriber Management:

services—To view this statement in the configuration.

services–control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.1.

Support at the `[edit services pcef pcc-rules rule-name from]` hierarchy level introduced for Junos OS Broadband Subscriber Management in Junos OS Release 17.2 on MX Series.

Support for Next Gen Services for Junos OS Broadband Subscriber Management introduced in Junos OS Release 19.3R2 on MX Series.

```

Description

Configure application identification to identify applications regardless of the application port or protocol that is used to transmit the application.

Use this option to configure various options for the application identification such as application signatures, application groups, signature package download option, enable and deactivating application system cache, application traffic throughput, micro applications, application identification inspection limit, trace options and so on to use the application identification functionality.

Once the application is determined, other AppSecure service modules are configured to monitor and control traffic for tracking, prioritization, access control, detection, and prevention based on the application ID of the traffic.

Options

application *application-name*	Configure application definition. You can create custom application signatures by specifying a name, protocol, port where the application runs, and match criteria.
application-group *group-name*	Configure a custom application group for application identification.
application-system-cache-timeout *value*	Specify the timeout value in seconds for the application system cache (ASC) entries.
download	Configure automatic download for the application identification services application package.

enable-cdn-application-detection

Enable application identification (AppID) to classify a web application hosted on a content delivery network (CDN).

enable-performance-mode max-packet-threshold *number*

Set the deep packet inspection (DPI) in performance mode for application identification.

global-offload-byte-limit *byte-limit-number*

Specify the maximum number of byte limit before concluding the classification for identifying an application.

> **NOTE**: The byte limit excludes the IP header and the TCP/UDP header lengths.

- **Range:** 0 through 4294967295
- **Default:** 10000

imap-cache-size *number*

Configure to limit the maximum number of entries in the IMAP cache.

imap-cache-timeout *time-period*

Specify the timeout value for the entries in the IMAP cache cache.

inspection-limit

Specify the maximum number of byte limit before concluding the classification for identifying an application in TCP and UDP sessions.

> **NOTE**: The byte limit excludes the IP header and the TCP/UDP header lengths.

tcp byte-limit *byte-limit-number*

Specify the byte limit.

- **Range:** 0 through 4294967295
- **Default:** 6000
- **Default:** For Junos OS Release 15.1X49-D200, the default value is 10000.

tcp packet-limit *packet-limit-number*

Specify the packet limit.

- **Range:** 0 through 4294967295
- **Default:** 0

udp byte-limit *byte-limit-number*

Specify the byte limit.

- **Range:** 0 through 4294967295
- **Default:** 0

udp packet-limit *packet-limit-number*

Specify the packet limit.

- **Range:** 0 through 4294967295
- **Default:** 10
- **Default:** For Junos OS Release 15.1X49-D200, the default value is 20.

max-memory *value*

Specify maximum memory limit for the deep packet inspection (DPI).

- **Range:** 1 through 200000 MB

micro-apps

Enable micro-application detection with application identification feature.

no-application-identification;

Disable the application identification of applications running on nonstandard ports. By default, application identification is enabled on the device.

no-application-system-cache

Disable application system cache. ASC is enabled by default when a session is created

interval *interval-number;*

Specify the interval, in minutes, for statistics collection.

traceoptions

pecify the trace file information.

no-application-statistics

Configure this configuration statement to disable the application statistics in the AppTrack session.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.2.

Custom application definition option introduced in Junos OS Release 15.1X49-D40.

`Risk` option introduced in Junos OS Release 19.1R1.

`micro-app` option introduced in Junos OS Release 19.2R1.

`global-offload-byte-limit` and `inspection-limit` options are introduced in Junos OS Release 19.4R1 and 15.1X49-D200.

Configuration statement `no-application-statistics` is added in Junos OS Release 21.1R1.

- Syntax | 2336
- Hierarchy Level | 2337
- Description | 2337
- Options | 2337
- Required Privilege Level | 2337
- Release Information | 2337

Syntax

```
application-identification {
    max-packet-memory-ratio percentage-value;
    max-reass-packet-memory-ratio percentage-value;
    max-tcp-session-packet-memory value;
    max-udp-session-packet-memory value;
}
```

Hierarchy Level

```
[edit security idp sensor-configuration]
```

Description

Enable to identify the TCP/UDP application session running on nonstandard ports to match the application properties of transiting network traffic.

Options define the allocation of IDP memory to application identification for packet and reassembler use.

Options

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.2. Packet memory percentages added in Junos OS Release 12.1X44-D20.

Description

Configure application identification to identify applications regardless of the application port or protocol that is used to transmit the application.

Use this option to configure various options for the application identification such as application signatures, application groups, signature package download option, enable and deactivating application system cache, application traffic throughput, micro applications, application identification inspection limit, trace options and so on to use the application identification functionality.

Once the application is determined, other AppSecure service modules are configured to monitor and control traffic for tracking, prioritization, access control, detection, and prevention based on the application ID of the traffic.

Options

application *application-name*

Configure application definition. You can create custom application signatures by specifying a name, protocol, port where the application runs, and match criteria.

application-group *group-name*

Configure a custom application group for application identification.

application-system-cache-timeout *value*

Specify the timeout value in seconds for the application system cache (ASC) entries.

download

Configure automatic download for the application identification services application package.

enable-cdn-application-detection

Enable application identification (AppID) to classify a web application hosted on a content delivery network (CDN).

enable-performance-mode max-packet-threshold *number*

Set the deep packet inspection (DPI) in performance mode for application identification.

global-offload-byte-limit *byte-limit-number*

Specify the maximum number of byte limit before concluding the classification for identifying an application.

> **NOTE**: The byte limit excludes the IP header and the TCP/UDP header lengths.

- **Range:** 0 through 4294967295
- **Default:** 10000

imap-cache-size *number*

Configure to limit the maximum number of entries in the IMAP cache.

imap-cache-timeout *time-period*

Specify the timeout value for the entries in the IMAP cache cache.

inspection-limit

Specify the maximum number of byte limit before concluding the classification for identifying an application in TCP and UDP sessions.

> **NOTE**: The byte limit excludes the IP header and the TCP/UDP header lengths.

tcp byte-limit *byte-limit-number*

Specify the byte limit.

- **Range:** 0 through 4294967295
- **Default:** 6000
- **Default:** For Junos OS Release 15.1X49-D200, the default value is 10000.

tcp packet-limit *packet-limit-number*

Specify the packet limit.

- **Range:** 0 through 4294967295
- **Default:** 0

udp byte-limit *byte-limit-number*

Specify the byte limit.

- **Range:** 0 through 4294967295
- **Default:** 0

udp packet-limit *packet-limit-number*

Specify the packet limit.

- **Range:** 0 through 4294967295
- **Default:** 10
- **Default:** For Junos OS Release 15.1X49-D200, the default value is 20.

max-memory *value*

Specify maximum memory limit for the deep packet inspection (DPI).

- **Range:** 1 through 200000 MB

micro-apps

Enable micro-application detection with application identification feature.

micro-app-max-transactions

Set the number of micro-applications transaction finals to terminate application classification.

- **Range:** 1 through 25
- **Default:** 5

no-application-identification;

Disable the application identification of applications running on nonstandard ports. By default, application identification is enabled on the device.

no-application-system-cache

Disable application system cache. ASC is enabled by default when a session is created

interval ***interval-number;***	Specify the interval, in minutes, for statistics collection.
traceoptions	Specify the trace file information.
no-application-statistics	Configure this configuration statement to disable the application statistics in the AppTrack session.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.1.

Support for Next Gen Services introduced in Junos OS Release 19.3R2 and 19.4R1 on MX Series routers MX240, MX480 and MX960.

Release Information

Statement introduced in Junos OS Release 9.5.

The `[edit security utm default-configuration]` hierarchy level is introduced in Junos OS Release 18.2R1.

application-screen (Security H323)

IN THIS SECTION

- Syntax | 2359
- Hierarchy Level | 2360
- Description | 2360
- Options | 2360
- Required Privilege Level | 2360
- Release Information | 2360

Syntax

```
application-screen {
    message-flood {
```

```
        gatekeeper {
            threshold rate;
        }
    }
    unknown-message {
        permit-nat-applied;
        permit-routed;
    }
}
```

Hierarchy Level

```
[edit logical-systems name security alg h323],
[edit logical-systems name tenants name security alg h323],
[edit security alg h323],
[edit services alg h323],
[edit tenants name security alg h323]
```

Description

Configure the security screens for the H.323 protocol Application Layer Gateway (ALG) to handle unknown-messages and protect H.323 server.

Options

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

application-screen (Security MGCP)

IN THIS SECTION

- Syntax | 2361
- Hierarchy Level | 2361
- Description | 2362
- Options | 2362
- Required Privilege Level | 2362
- Release Information | 2362

Syntax

```
application-screen {
    connection-flood {
        threshold rate;
    }
    message-flood {
        threshold rate;
    }
    unknown-message {
        permit-nat-applied;
        permit-routed;
    }
}
```

Hierarchy Level

```
[edit logical-systems name security alg mgcp],
[edit logical-systems name tenants name security alg mgcp],
```

```
[edit security alg mgcp],
[edit services alg mgcp],
[edit tenants name security alg mgcp]
```

Description

Configure the security screens for the Media Gateway Control Protocol (MGCP) Application Layer Gateway (ALG) to handle unknown-messages and protect MGCP server.

Options

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

RELATED DOCUMENTATION

mgcp | 10693

application-screen (Security SCCP)

IN THIS SECTION

- Syntax | 2363
- Hierarchy Level | 2363
- Description | 2363
- Options | 2363

Required Privilege Level | 2363
Release Information | 2364

Syntax

```
application-screen {
    call-flood {
        threshold rate;
    }
    unknown-message {
        permit-nat-applied;
        permit-routed;
    }
}
```

Hierarchy Level

```
[edit logical-systems name security alg sccp],
[edit logical-systems name tenants name security alg sccp],
[edit security alg sccp],
[edit services alg sccp],
[edit tenants name security alg sccp]
```

Description

Configure the security screens for the Skinny Client Control Protocol (SCCP) Application Layer Gateway (ALG) to handle unknown-messages and protect SCCP server.

Options

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

application-screen (Security SIP)

IN THIS SECTION

- Syntax | 2364
- Hierarchy Level | 2365
- Description | 2365
- Options | 2365
- Required Privilege Level | 2365
- Release Information | 2365

Syntax

```
application-screen {
    protect {
        deny {
            all {
                timeout value-in-seconds;
            }
            destination-ip address;
            timeout value-in-seconds;
        }
    }
    unknown-message {
```

```
        permit-nat-applied;
        permit-routed;
    }
}
```

Hierarchy Level

```
[edit logical-systems name security alg sip],
[edit logical-systems name tenants name security alg sip],
[edit security alg sip],
[edit services alg sip],
[edit tenants name security alg sip]
```

Description

Configure the security screens for the Session Initiation Protocol (SIP) Application Layer Gateway (ALG) to handle unknown-messages and protect SIP server.

IPv6 is supported on the SIP ALG along with Network Address Translation Protocol Translation (NAT-PT) mode and NAT64 address translation.

The type of the <destination-ip-address> is changed from IPv4 address to IP prefix to support all kinds of IP addresses, and correspondingly a prefix is supported to allow multiple IP addresses.

Options

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

application (Security Alarms)

IN THIS SECTION

- Syntax | 2366
- Hierarchy Level | 2366
- Description | 2366
- Options | 2367
- Required Privilege Level | 2367
- Release Information | 2367

Syntax

```
application {
    duration interval;
    size count;
    threshold value;
}
```

Hierarchy Level

```
[edit security alarms potential-violation policy]
```

Description

Configure alarms for a number of policy violations to an application within a specified time period.

Options

- `duration` *`interval`*—Indicate the duration of counters.
- **Range:** 1 through 3600 seconds.
- **Default:** 1 second.
- `size` *`count`*—Indicate the number of applications for which policy violation checks can be done concurrently.
- **Range:** 1 through 10240.
- **Default:** 1024.
- `threshold` *`value`*—Indicate the maximum number of application matches required to raise an alarm.
- **Range:** 1 through 4294967295.
- **Default:** 1000.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.2.

Security Policies Overview

application (Security Custom Attack)

IN THIS SECTION

Syntax | 2368

- Hierarchy Level | 2368
- Description | 2368
- Options | 2368
- Required Privilege Level | 2368
- Release Information | 2368

Syntax

```
application application-name;
```

Hierarchy Level

```
[edit security idp custom-attack attack-name attack-type chain protocol-binding]
[edit security idp custom-attack attack-name attack-type signature protocol-binding]
```

Description

Allow IDP to match the attack for a specified application.

Options

application-name—Name of the application.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.3.

application (Security Destination NAT)

IN THIS SECTION

- Syntax | 2369
- Hierarchy Level | 2369
- Description | 2369
- Options | 2370
- Required Privilege Level | 2370
- Release Information | 2370

Syntax

```
application {
    [application];
    any;
}
```

Hierarchy Level

```
[edit logical-systems name security nat destination rule-set rule-set-name rule rule-name match],
[edit logical-systems name tenants name security nat destination rule-set rule-set-name rule
rule-name match],
[edit security nat destination rule-set rule-set-name rule rule-name match],
[edit services nat destination rule-set rule-set-name rule rule-name match],
[edit tenants name nat destination rule-set rule-set-name rule rule-name match]
```

Description

Specify an application name to match the rule. You can specify multiple application names, but the number of application terms must not exceed 3072.

Options

application-name—Name of the application.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1X47-D10.

RELATED DOCUMENTATION

application (Security IDP)

IN THIS SECTION

- Syntax | 2370
- Hierarchy Level | 2371
- Description | 2371
- Options | 2371
- Required Privilege Level | 2371
- Release Information | 2371

Syntax

```
application application-name;
```

Hierarchy Level

```
[edit security idp idp-policy policy-name rulebase-ips rule rule-name match]
```

Description

Specify an application or an application set name to match.

Options

application-name—Name of the application.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.2.

application (Security Policies)

IN THIS SECTION

- Syntax | 2372
- Hierarchy Level | 2372
- Description | 2372
- Options | 2372
- Required Privilege Level | 2372
- Release Information | 2373

Syntax

```
application {
    [application];
    any;
}
```

Hierarchy Level

```
[edit security policies from-zone zone-name to-zone zone-name policy policy-name match]
```

```
[edit security policies global policy policy-name match]
```

Description

Specify the IP or remote procedure call (RPC) application or set of applications to be used as match criteria.

Starting in Junos OS Release 19.1R1, configuring the `application` statement at the `[edit security policies from-zone zone-name to-zone zone-name policy policy-name match]` hierarchy level is optional if the `dynamic-application` statement is configured at the same hierarchy level.

Options

application-name-or-set Name of the predefined or custom application or application set used as match criteria.

any Any predefined or custom applications or application sets.

> **NOTE**: A custom application that does not use a predefined destination port for the application will not be included in the `any` option, and must be named explicitly.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

application (Security Policies) | 2371

application-services (Security Forwarding Process)

IN THIS SECTION

- Syntax | 2375
- Hierarchy Level | 2375
- Description | 2375
- Options | 2376
- Required Privilege Level | 2376
- Release Information | 2377

Syntax

```
application-services {
    enable-gtpu-distribution;
    inline-fpga-crypto (disabled | enabled);
    maximize-alg-sessions;
    maximize-idp-sessions {
        weight (firewall | idp);
    }
    packet-ordering-mode (Application Services) {
        (hardware | software);

    }
}
```

Hierarchy Level

```
[edit security forwarding-process]
```

Description

You can configure SRX4100, SRX4200, SRX5400, SRX5600, and SRX5800 devices to switch from an integrated firewall mode to maximize Intrusion Detection and Prevention (IDP) mode to run IDP

processing in tap mode and increase the capacity of processing with the `maximize-idp-sessions` option. Inline tap mode can only be configured if the forwarding process mode is set to `maximize-idp-sessions`, which ensures stability and resiliency for firewall services. You also do not need a separate tap or span port to use inline tap mode. When you maximize IDP, you are decoupling IDP processes from firewall processes, allowing the device to support the same number of firewall and IDP sessions, also run the IDP processing in tap mode.

You can configure maximum Application Layer Gateway (ALG) sessions by using the `maximize-alg-sessions` option. The session capacity number for Real-Time Streaming Protocol (RTSP), FTP, and Trivial File Transfer Protocol (TFTP) ALG varies per flow SPU. For SRX5000 line devices the session capacity is 10,240 per flow SPU. You must reboot the device (and its peer in chassis cluster mode) for the configuration to take effect. The `maximize-alg-sessions` option now enables you to increase defaults as follows:

- TCP proxy connection capacity: 40,000 per flow SPU

  Flow session capacity is reduced to half per flow SPU; therefore the aforementioned capacity numbers will not change on central point flow.

Enable GPRS tunneling protocol. GTP-U session distribution is a UE (User equipment) based distribution, generating tunnel based GTP-U session and distributing them across SPUs on a UE basis.

Before 15.1X49-D40, GTP-U sessions are distributed by GGSN IP address always.

15.1X49-D40 onward, the GTP-U distribution is disabled and fat GTP-U sessions are distributed as normal UDP.

Use the `enable-gtpu-distribution` command to enable GTP-U session distribution.

Use the `inline-fpga-crypto (disabled | enabled)` to enable or disable inline FPGA crypto

Options

The remaining statements are explained separately. See the CLI Explorer.

Required Privilege Level

security—To view this in the configuration.

security-control—To add this to the configuration.

Release Information

Statement introduced in Junos OS Release 9.6. Statement updated in Junos OS Release 10.4. Statement updated in Junos OS Release 15.1X49-D40 with the `enable-gtpu-distribution` option. Statement updated in Junos OS Release 20.4R1 with the `inline-fpga-crypto (disabled | enabled)` option.

        profile-name profile-name;
    }
}
```

Hierarchy Level

```
[edit security policies from-zone zone-name to-zone zone-name policy policy-name then permit]
```

Description

Enable application services within a security policy. You can enable service such as application firewall, IDP, Content Security, SSL proxy, and so on by specifying them in a security policy permit action, when the traffic matches the policy rule.

Options

advanced-anti-malware-policy	Specify advanced-anti-malware policy name.
application-firewall	Specify the rule sets configured as part of application firewall to be applied to the permitted traffic.
application-traffic-control	Specify the rule sets configured as part of AppQoS, application-aware quality of service, to be applied to the permitted traffic.
casb-policy	Specify CASB policy name.
gprs-gtp-profile	Specify GPRS tunneling protocol profile name.
gprs-sctp-profile	Specify GPRS stream control protocol profile name.
idp	Apply Intrusion detection and prevention (IDP) as application services.
redirect-wx	Specify the WX redirection needed for the packets that arrive from the LAN.
reverse-redirect-wx	Specify the WX redirection needed for the reverse flow of the packets that arrive from the WAN.
security-intelligence-policy	Specify security-intelligence policy name.
security-intelligence	Specify the security intelligence feed post action. The following feeds are supported: • add-destination-identity-to-feed • add-destination-ip-to-feed • add-source-identity-to-feed • add-source-ip-to-feed
security-metadata-streaming-policy	Enable metadata streaming of the traffic permitted by the security policy.

uac-policy

Enable Unified Access Control (UAC) for the security policy. This statement is required when you are configuring the SRX Series Firewall to act as a Junos OS Enforcer in a UAC deployment.

captive-portal *captive-portal*

Specify the preconfigured security policy for captive portal on the Junos OS Enforcer to enable the captive portal feature. The captive portal policy is configured as part of the UAC policy. By configuring the captive portal feature, you can redirect traffic destined for protected resources to the IC Series device or to the URL you configure on the Junos OS Enforcer.

Content Security-policy *Content Security-policy*

Specify Content Security policy name. The Content Security policy configured for antivirus, antispam, content-filtering, traffic-options, and Web-filtering protocols is attached to the security policy to be applied to the permitted traffic.

web-proxy *profile-name*

Specify secure Web proxy profile name. The secure Web proxy profile is configured with dynamic application and external proxy server details. This profile is attached to the security policy and applied on the permitted traffic.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement modified in Junos OS Release 11.1.

[edit routing-instances routing-instance-name protocols ospf area area-id interface interface-
name],
[edit routing-instances routing-instance-name protocols ospf area area-id virtual-link]
```

Description

Configure application (flexible algorithm) specific attributes such as te-attributes: te-metric, delay-metric, or admin-groups.

NOTE: The Junos OS and Junos OS Evolved implementation of OSPF application-specific link attribute supports flexible algorithm application only.

Options

attribute-group *name*

Indicates an application-specific link attribute for the link. The attribute-group enables multiple applications to share the same attribute.

- admin-group—Define an admin-group for the attribute group. You can commit this configuration only if an application is associated with the attribute group.
- advertise-interface-delay—Specify to fetch the delay values from the interface configuration hierarchy, that is, legacy delay values. You can commit this configuration only if the following criteria match:
  - An application is associated with the attribute group.
  - The `delay-metric` option is not configured in the hierarchy. The `delay-metric` and `advertise-interface-delay` configuration options must be mutually exclusive.
  - Either of the following configurations: `[edit protocols ospf interface delay-metric` or `delay-measurement` are present.
- application flex-algorithm—Configure application-specific attributes. For example, flexible algorithm specific te-attributes such as te-metric, delay-metric, or admin-groups.
- delay-metric—Define a delay-metric for the attribute group. You can commit this configuration only if an application is associated with the attribute group.
- te-metric—Define a te-metric for the attribute group. You can commit this configuration only if an application is associated with the attribute group.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS and Junos OS Evolved Release 22.2R1.

RELATED DOCUMENTATION

application-status

IN THIS SECTION

- Syntax | 2392
- Hierarchy Level | 2392
- Description | 2392
- Default | 2393
- Options | 2393
- Required Privilege Level | 2393
- Release Information | 2393

Syntax

```
application-status (any | error)
```

Hierarchy Level

```
[edit system syslog console]
```

Description

Enable logging of application start or stop status. During system reboot, by default, the systemd process logs messages for applications to the journal log. By default, application stop and start status are written to the journal log. Only application stop and start errors are logged to the console.

This configuration statement allows each application's stop and start application status logs to be logged to the console. You configure the `any` option to allow all systemd application stop and start messages to be written to the console, not just error messages. You configure the `error` option to return to the default setting.

Default

Write only application stop and start error messages to the console.

Options

(any | error)

- any—Write all application stop and start status messages to the console.
- error—Write only application stop and start error messages to the console.
- Default: error

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Evolved Release 23.1R1.

RELATED DOCUMENTATION

System Log Explorer

application-system-cache

IN THIS SECTION

- Syntax | 2394
- Hierarchy Level | 2394
- Description | 2394
- Options | 2394
- Required Privilege Level | 2395

Release Information | 2395

Syntax

```
application-system-cache;
```

Hierarchy Level

```
application-system-cache {
    no-miscellaneous-services;
    security-services;
}
```

Description

Enable application system cache (ASC) to save the mapping between an application type and the corresponding destination IP address, destination port, protocol type, and service.

ASC is enabled by default when a session is created. You can manually turn this caching off using the `set services application-identification no-application-system-cache` command. You can re-enable the ASC by using the `delete services application-identification application-system-cache` command.

You can enable the ASC for faster application identification process and disable it for performance benefits and security.

Note the differences in the default behavior of ASC for services starting from Junos OS Release 18.2R1:

- Security services including security policies, application firewall (AppFW), application tracking (AppTrack), application quality of service (AppQoS), Juniper ATP Cloud, IDP, and Content Security do not use the ASC by default.
- Miscellaneous services including advanced policy-based routing (APBR) use the ASC for application identification by default.

Options

no-miscellaneous-services	Disable the ASC for miscellaneous services such as APBR and AppTrack.

security-services Enable the ASC for security services such as security policies, application firewall (AppFW), Juniper ATP Cloud, IDP, and Content Security.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.2. The options `no-miscellaneous-services` and `security-services` are introduced in Junos OS Release 18.2R1.

RELATED DOCUMENTATION

Understanding the Application System Cache

application-system-cache-timeout (Services)

IN THIS SECTION

- Syntax | 2395
- Hierarchy Level | 2396
- Description | 2396
- Options | 2396
- Required Privilege Level | 2396
- Release Information | 2396

Syntax

```
application-system-cache-timeout value;
```

Hierarchy Level

```
[edit services application-identification]
```

Description

Specify the timeout value in seconds for the application system cache (ASC) entries.

ASC saves the mapping between an application type and the corresponding destination IP address, destination port, protocol type, and service. By default, the ASC saves the mapping information for 3600 seconds.

> **NOTE**: On SRX Series Firewalls, when you change the timeout value for the application system cache entries using the command `set services application-identification application-system-cache-timeout`, the cache entries need to be cleared to avoid inconsistency in timeout values of existing entries.

> **NOTE**: ASC is not cleared when the IDP policy is loaded. Users need to manually clear or wait for the cache entries to expire.

Options

value—Timeout value for the application system cache entries.

- **Range:** 0 through 1,000,000 seconds
- **Default:** 3600 seconds

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.2. Support.

RELATED DOCUMENTATION

Understanding the Application System Cache

application-tracking

IN THIS SECTION

- Syntax | 2397
- Hierarchy Level | 2397
- Description | 2398
- Options | 2398
- Required Privilege Level | 2399
- Release Information | 2399

Syntax

```
application-tracking {
    (first-update | first-update-interval minutes);
    disable (Application Tracking);
    session-update-interval minutes;
log-session-create;
log-session-close;
session-update-interval session-update-interval;
no-volume-updates;
}
```

Hierarchy Level

```
[edit security]
```

Description

Enable application tracking (AppTrack).

After application identification identifies the application, AppTrack collects statistics for the application usage on the device, and when the session closes, AppTrack generates a message that provides the byte and packet counts and duration of the session, and sends details to the host device such as Security Threat Response Manager (STRM). STRM retrieves the data and provides flow-based application visibility details.

Options

first-update Generate application tracking initial message when a session is created. This option overrides the `first-update-interval` option if both are specified.

first-update-interval Interval when the first update message is sent (minutes).

> **NOTE**: The `first-update-interval` setting is disregarded if the `first-update` option is set to log the first message at session start.

- ***minutes*** Maximum number of minutes after session start for the first update message to be sent. This value must be smaller than the `session-update-interval` setting.
  - **Default:** 1

disable Disable application tracking.

session-update-interval Frequency in which application tracking update messages are generated (minutes).

log-session-create Use this configuration statement to enable application tracking session.

log-session-close Use this configuration statement to re-enable AppTrack session after closing the session.

session-update interval ***session-update-interval*** Configure the interval between session update messages for long-lived sessions being monitored by AppTrack. Byte count, packet count, and start and end times are updated and logged when the amount of time between session start or the previous update and the current time exceeds the interval.

no-volume-updates Use this configuration statement to disable AppTrack volume update.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.2. Support for `disable` added in Junos OS Release 11.4.

Configuration statement `log-session-create`, `log-session-close`, `session-update-interval` *`session-update-interval`*, and `no-volume-updates` are added in Junos OS Release 21.1R1.

- Required Privilege Level | 2425
- Release Information | 2425

Syntax

```
apply-groups [$node]
```

Hierarchy Level

```
[edit chassis cluster]
```

Description

Apply node-specific parameters to each node in a chassis cluster.

You can use the `[edit groups]` option to create a unique configuration between the cluster members by defining a unique hostname for each node and assigning a unique IP address for the fxp0 interface on each node.

Each group is named after the node it is applied to (node 0 and node 1) and once you apply the configured groups using the `apply-groups` statement, only the group that matches the node name is applied.

The configuration you specified under group node 0 will be active only on node 0 and the configuration you specified under group node 1 will be active only on node 1.

Options

${node} Each node (node0 or node1) in a chassis cluster.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.0.

apply-macro

IN THIS SECTION

- Syntax | 2430
- Hierarchy Level | 2430
- Description | 2430
- Options | 2431
- Required Privilege Level | 2431
- Release Information | 2431

Syntax

```
apply-macro apply-macro-name {
    parameter-name parameter-value;
}
```

Hierarchy Level

All hierarchy levels

Description

Use custom syntax in your configuration, which is expanded into standard Junos OS configuration statements during the commit process using the instructions defined in the corresponding commit script macro.

Macros work by locating `apply-macro` statements that you include in the *candidate configuration* and using the values specified in the `apply-macro` statement as parameters to a set of instructions (the macro) defined in a commit script. The commit script alters your configuration from one that contains custom syntax into a full configuration containing standard Junos OS statements.

In effect, your custom configuration syntax serves a dual purpose. The syntax allows you to simplify your configuration tasks, and it provides data (or *hooks*) that are used by commit script macros.

You can include the `apply-macro` statement at any level of the configuration hierarchy. You can include multiple `apply-macro` statements at each level of the configuration hierarchy; however, each must have a unique name.

Options

apply-macro-name Name of the `apply-macro` statement.

parameter-name One or more parameters. Parameters can be any text you want to include in your configuration.

parameter-value A value that corresponds to the parameter name. Parameter values can be any text you want to include in your configuration.

Required Privilege Level

configure—To enter configuration mode; other required privilege levels depend on where the statement is located in the configuration hierarchy.

Release Information

Statement introduced in Junos OS Release 7.4.

Overview of Creating Custom Configuration Syntax with Commit Script Macros

apply-path

IN THIS SECTION

- Syntax | 2432
- Hierarchy Level | 2432
- Description | 2432
- Options | 2432

Required Privilege Level | 2433
Release Information | 2433

Syntax

```
apply-path path;
```

Hierarchy Level

```
[edit logical-systems logical-system-name policy-options prefix-list name],
[edit policy-options prefix-list name]
```

Description

Expand a prefix list to include all prefixes pointed to by a defined path. Using the `apply-path` statement eliminates most of the effort required to maintain a group prefix list. You can use this expanded list in defining policies and firewalls.

You can also use the `apply-path` configuration statement with SNMP, as long as the path uses the following configuration: `apply-path "policy-options prefix-list list-name <*>"`. This is the only `apply-path` configuration originally supported for SNMP. As of Junos OS Release 16.1, support for one other SNMP `apply-path` configuration is added: `apply-path "access radius-server <*>"`.

> **NOTE**: The wildcard regex format of the type `" et<*> "` for `apply-path` configuration statement at the `[edit policy-options prefix-list]` hierarchy is not supported.

Options

path—String of elements composed of identifiers or configuration keywords that points to a set of prefixes. Use a space to delimit multiple elements. As long as the last path element is not a leaf, that is, terminal, statement, you can include wildcards (enclosed in angle brackets) to match more than one identifier. No elements can be added after a leaf statement, including wildcards.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Support for `apply-path "access radius-server <*>"` configuration for SNMP added in Junos OS Release 16.1.

Support for the `prefix-list` match condition added in Junos OS Evolved Release 20.2R1 for PTX10003.

apply-secondary-as-giaddr

IN THIS SECTION

- Syntax | 2433
- Hierarchy Level | 2434
- Description | 2434
- Required Privilege Level | 2434
- Release Information | 2435

Syntax

```
apply-secondary-as-giaddr;
```

Hierarchy Level

For platforms without ELS:

```
[edit forwarding-options helpers bootp],
[edit forwarding-options helpers bootp interface]
```

For platforms with ELS:

```
[edit forwarding-options dhcp-relay overrides]
[edit forwarding-options dhcp-relay group name interface name overrides]
```

Description

Configures the interfaces on a switch that are DHCP relay agents to be enabled for smart DHCP relay. Smart DHCP relay enables you to configure alternative IP addresses for the gateway interface so that if the server fails to reply to the requests sent from the primary gateway address, the switch can resend the requests using the alternative gateway addresses. To use this feature, you must configure an IRB interface or Layer 3 subinterface with multiple IP addresses and configure that interface to be a relay agent. This feature is not supported for EVPN-VXLAN deployments.

Depending on where you configure this statement, it enables smart relay on all the interfaces that are relay agents or on specific interfaces. To enable smart relay on all the interfaces that are relay agents, configure this statement at the following locations:

- Junos OS with ELS: configure it under `edit forwarding-options dhcp-relay overrides`.
- Junos OS without ELS: configure it directly under the **bootp** statement.

To enable smart relay on specific interfaces that are relay agents, configure this statement at the following locations:

- Junos OS with ELS: configure it under `edit forwarding-options dhcp-relay group` *`name`* `interface` *`name`* `overrides`.
- Junos OS without ELS: configure it directly under the **interface** statement.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.1X53-D26.

- Release Information | 2436

Syntax

```
apply-to-half-close-state;
```

Hierarchy Level

```
[edit security flow tcp-session time-wait-state]
```

Description

Configure the TCP session timeout in a half-closed state. This enables the system to apply the configured session timeout on receiving only one FIN packet (either client-to-server or server-to-client). When this is not configured, the default behavior takes effect—applying the configured TCP session timeout on receiving both the FIN packets. The default session timeout remains 150 seconds.

Required Privilege Level

security—To view this in the configuration.

security-control—To add this to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1X46-D10.

- Syntax | 2438
- Hierarchy Level | 2438
- Description | 2439
- Options | 2439
- Required Privilege Level | 2440
- Release Information | 2440

Syntax

```
archival {
    configuration {
        archive-sites {
            file://<path>/<filename>;
            ftp://username@host<:port>url-path password password;
            http://username@host<:port>url-path password password;
            pasvftp://username@host<:port>url-path password password;
            scp://username@host<:port>url-path password password;
        }
        transfer-interval interval;
        transfer-on-commit;
    }
    routing-instance routing-instance;
}
```

Hierarchy Level

```
[edit system]
```

Description

Configure copying of the currently active configuration to an archive site. An archive site can be a file, or an FTP, HTTP, passive FTP, or SCP location.

Options

configuration

Configure the router or switch to periodically transfer its currently active configuration (or after each commit). Parameters include `archive-sites`, `transfer-interval`, and `transfer-on-commit`.

> **NOTE**: The `[edit system archival]` hierarchy is not available on QFabric systems.

archive-sites

Specify where to transfer the current configuration files. When specifying a URL in a Junos OS statement using an IPv6 host address, you must enclose the entire URL in quotation marks (" ") and enclose the IPv6 host address in brackets ([ ]). For example: **"scp:// *username*<:*password*>@[*ipv6-host-address*]<:*port*>/ *url-path*"**.

If you specify more than one archive site, the router or switch attempts to transfer the configuration files to the first archive site in the list, moving to the next only if the transfer fails. The destination filename is saved in the following format, where *n* corresponds to the number of the compressed configuration rollback file that has been archived:

```
router-name_YYYYMMDD_HHMMSS_juniper.conf.n.gz
```

The time included in the destination filename is always in Coordinated Universal Time (UTC) regardless of whether the time on the router or switch is configured as UTC or the local time zone. The default time zone on the router or switch is UTC.

transfer-interval

The frequency, in minutes, for transferring the current configuration to an archive site. Valid intervals are 15 to 2880 minutes.

transfer-on-commit

Configure the router or switch to transfer its currently active configuration to an archive site each time you commit a candidate configuration.

routing-instance

Defines the routing instance through which a server is reachable.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Backing Up Configurations to an Archive Site

archive (All System Log Files)

IN THIS SECTION

- Syntax | 2440
- Hierarchy Level | 2441
- Description | 2441
- Options | 2441
- Required Privilege Level | 2442
- Release Information | 2442

Syntax

```
archive <files number> <size size> <start-time time> <transfer-interval interval>
<binary-data | no-binary-data> <world-readable | no-world-readable>;
```

Hierarchy Level

```
[edit system syslog file filename]
```

Description

Configure archiving properties for all system log files.

Options

`files number`—Maximum number of archived log files to retain. When the Junos OS logging utility has written a defined maximum amount of data to a log file ***logfile***, it closes the file, compresses it, and renames it ***logfile*.0.gz** (the amount of data is determined by the `size` statement at this hierarchy level). The utility then opens and writes to a new file called ***logfile***. When the new file reaches the maximum size, the ***logfile*.0.gz** file is renamed to ***logfile*.1.gz**, and the new file is closed, compressed, and renamed ***logfile*.0.gz**. By default, the logging facility creates up to ten archive files in this manner. Once the maximum number of archive files exists, each time the active log file reaches the maximum size, the contents of the oldest archive file are lost (overwritten by the next oldest file).

- **Range:** 1 through 1000
- **Default:** 10 files

`size size`—Maximum amount of data that the Junos OS logging utility writes to a log file ***logfile*** before archiving it (closing it, compressing it, and changing its name to ***logfile*.0.gz**). The utility then opens and writes to a new file called ***logfile***.

- **Syntax:** *x* `k` to specify the number of kilobytes, *x* `m` for the number of megabytes, or *x* `g` for the number of gigabytes
- **Range:** 64 KB through 1 GB

Default:

- - 128 KB for EX Series switches
  - 1 MB for M Series, MX Series, and T Series routers, OCX Series, and the QFX3500 switch, and SRX Series Firewalls and vSRX Virtual Firewall.
  - 10 MB for TX Matrix and TX Matrix Plus routers

`binary-data | no-binary-data`—Mark file as containing binary data. This allows proper archiving of binary files, such as WTMP files (login records for UNIX based systems)..

- **Default:** `no-binary-data`

`world-readable | no-world-readable`—Grant all users permission to read archived log files, or restrict the permission only to the `root` user and users who have the Junos OS `maintenance` permission.

- **Default:** `no-world-readable`

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Syntax

```
archive <archive-sites (ftp-url  <password password>)> <binary-data binary-data> <files number>
<no-binary-data  no-binary-data> <size size> <start-time "YYYY-MM-DD.hh:mm"> <transfer-
interval minutes> <world-readable | no-world-readable>;
```

Hierarchy Level

```
[edit system syslog file filename]
```

Description

Configure archiving properties for a specific system log file.

Options

archive-sites ***site-name***—FTP URL representing the destination for the archived log file (for information about how to specify valid FTP URLs, see Format for Specifying Filenames and URLs in Junos OS CLI Commands). If more than one site name is configured, a list of archive sites for the system log files is created. When a file is archived, the router attempts to transfer the file to the first URL in the list, moving to the next site only if the transfer does not succeed. The log file is stored at the archive site with the filename specified at the **[edit system syslog]** hierarchy level.

files ***number***—Maximum number of archived log files to retain. When the Junos OS logging utility has written a defined maximum amount of data to a log file ***logfile***, it closes the file, compresses it, and renames it ***logfile*.0.gz** (the amount of data is determined by the **size** statement at this hierarchy level). The utility then opens and writes to a new file called ***logfile***. When the new file reaches the maximum size, the ***logfile*.0.gz** file is renamed to ***logfile*.1.gz**, and the new file is closed, compressed, and renamed ***logfile*.0.gz**. By default, the logging facility creates up to ten archive files in this manner. Once the maximum number of archive files exists, each time the active log file reaches the maximum size, the contents of the oldest archive file are lost (overwritten by the next oldest file).

- **Range:** 1 through 1000
- **Default:** 10 files

password ***password***—Password for authenticating with the site specified by the **archive-sites** statement.

binary-data | no-binary-data—Mark file as containing binary data. This allows proper archiving of binary files, such as WTMP files (login records for UNIX based systems)..

- **Default:** `no-binary-data`

size ***size***—Maximum amount of data that the Junos OS logging utility writes to a log file ***logfile*** before archiving it (closing it, compressing it, and changing its name to ***logfile*.0.gz**). The utility then opens and writes to a new file called ***logfile***.

- **Syntax:** ***x*k** to specify the number of kilobytes, ***x*m** for the number of megabytes, or ***x*g** for the number of gigabytes
- **Range:** 64 KB through 1 GB
- **Default:** 128 KB for J Series routers; 1 MB for M Series, MX Series, and T Series routers, and the QFX3500 switch; 10 MB for TX Matrix and TX Matrix Plus routers

start-time "*YYYY-MM-DD.hh:mm*"—Date and time in the local time zone for a one-time transfer of the active log file to the first reachable site in the list of sites specified by the **archive-sites** statement.

transfer-interval ***interval***—Interval at which to transfer the log file to an archive site.

- **Range: 5** through **2880** minutes

world-readable | no-world-readable—Grant all users permission to read archived log files, or restrict the permission only to the **root** user and users who have the Junos OS **maintenance** permission.

- **Default: no-world-readable**

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

start-time and **transfer-interval** statements introduced in Junos OS Release 8.5.

archive-sites

IN THIS SECTION

- Syntax | 2446
- Hierarchy Level | 2447
- Description | 2447
- Options | 2447
- Required Privilege Level | 2447
- Release Information | 2447

Syntax

```
archive-sites site-name {
    password password;
}
```

Hierarchy Level

```
[edit accounting-options file filename]
```

Description

Configure an archive site. If more than one site name is configured, an ordered list of archive sites for the accounting-data log files is created. When a file is archived, the router or switch attempts to transfer the file to the first URL in the list, moving to the next site only if the transfer does not succeed. The log file is stored at the archive site with a filename of the format ***router-name_log-filename_timestamp***. When you configure file archival by using the `archive-states` statement, the transfer file utility uses the default routing instance to connect to the destination server. If the default routing instance is unable to connect to the destination server, the transfer file utility does not work.

Starting in Junos OS Release 18.4R1, when you configure file archival by using the `archive-sites` statement, the transfer file utility does not work if you have enabled the management instance.

To delete an archive site, use the `delete` command instead of `set`.

Options

site-name—Any valid FTP/HTTP/SCP/SFTP URL to a destination.

password *password*—Password for logging into the archive site.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

multicast | ipv6-multicast)]
```

Description

Specify the area identifier for this routing device to use when participating in OSPF routing. All routing devices in an area must use the same area identifier to establish adjacencies.

Specify multiple `area` statements to configure the routing device as an area border router. An area border router does not automatically summarize routes between areas. Use the `area-range` statement to configure route summarization. By definition, an area border router must be connected to the backbone area either through a physical link or through a virtual link. To create a virtual link, include the `virtual-link` statement.

To specify that the routing device is directly connected to the OSPF backbone, include the `area 0.0.0.0` statement.

All routing devices on the backbone must be contiguous. If they are not, use the `virtual-link` statement to create the appearance of connectivity to the backbone.

You can also configure any interface that belongs to one or more topologies to advertise the direct interface addresses without actually running OSPF on that interface. By default, OSPF must be configured on an interface in order for direct interface addresses to be advertised as interior routes.

> **NOTE**: If you configure an interface with the `passive` statement, it applies to all the topologies to which the interface belongs. You cannot configure an interface as passive for only one specific topology and have it remain active for any other topologies to which it belongs.

Options

area-id—Area identifier. The identifier can be up to 32 bits. It is common to specify the area number as a simple integer or an IP address. Area number 0.0.0.0 is reserved for the OSPF backbone area.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Support for the `realm` statement introduced in Junos OS Release 9.2.

Support for the `realm` statement introduced in Junos OS Release 9.2 for EX Series switches.

Support for the `no-eligible-remote-backup` statement introduced in Junos OS Release 15.1.

Description

(Area border routers only) For an area, summarize a range of IP addresses when sending summary link advertisements (within an area). To summarize multiple ranges, include multiple `area-range` statements.

For a not-so-stubby area (NSSA), summarize a range of IP addresses when sending NSSA link-state advertisements. The specified prefixes are used to aggregate external routes learned within the area when the routes are advertised to other areas. To specify multiple prefixes, include multiple `area-range` statements. All external routes learned within the area that do not fall into one of the prefixes are advertised individually to other areas.

Default

By default, area border routing devices do not summarize routes being sent from one area to other areas, but rather send all routes explicitly.

Options

exact—(Optional) Summarization of a route is advertised only when an exact match is made with the configured summary range.

mask-length—Number of significant bits in the network mask.

network—IP address. You can specify one or more IP addresses.

override-metric ***metric***—(Optional) Override the metric for the IP address range and configure a specific metric value.

restrict—(Optional) Do not advertise the configured summary. This hides all routes that are contained within the summary, effectively creating a route filter.

- **Range:** 1 through 16,777,215

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Description

For Ethernet, Fast Ethernet, and Gigabit Ethernet interfaces only, configure Address Resolution Protocol (ARP) table entries mapping IP addresses to MAC addresses. IPv4 networks use ARP to map IP network addresses to physical (MAC) addresses. An address is resolved when the host device receives a proper ARP reply in response to the ARP request that it sent to a broadcast Ethernet address. The resolved addresses are stored in the ARP table for a configurable period of time. When an entry is close to expiration, it triggers the host to broadcast another ARP request to update the entry for that address. Only the intended receiver responds to the broadcast request; other recipients silently drop the request packet.

You can enable backup VRRP routers to learn ARP requests for VRRP-IP to VRRP-MAC address translation. You can also set the time interval between ARP updates.

NOTE: By default, an ARP policer is installed that is shared among all the Ethernet interfaces on which you have configured the `family inet` statement. By including the `arp` statement at the `[edit interfaces interface-name unit logical-unit-number family inet policer]` hierarchy level, you can apply a specific ARP-packet policer to an interface. This feature is not available on EX Series switches.

When you need to conserve IP addresses, you can configure an Ethernet interface to be unnumbered by including the `unnumbered-address` statement at the `[edit interfaces interface-name unit logical-unit-number family inet]` hierarchy level.

NOTE: For EX-Series switches, set only the time interval between ARP updates.

Options

aging-timer Time interval in minutes between ARP updates. In environments where the number of ARP entries to update is high (for example, on routers only, metro Ethernet environments), increasing the time between updates can improve system performance.

- **Range:** 1 through 240

arp-retries *count*

Configures the maximum number of retries the device attempts for ARP. The default retry attempts for ARP is 4.

ip-address

IP address to map to the MAC address. The IP address specified must be part of the subnet defined in the enclosing `address` statement.

mac *mac-address*

MAC address to map to the IP address. Specify the MAC address as six hexadecimal bytes in one of the following formats: *nnnn*.*nnnn*.*nnnn* or *nn*:*nn*:*nn*:*nn*:*nn*:*nn*. For example, `0000.5e00.5355` or `00:00:5e:00:53:55`.

multicast-mac *mac-address*

Multicast MAC address to map to the IP address. Specify the multicast MAC address as six hexadecimal bytes in one of the following formats: *nnnn*.*nnnn*.*nnnn* or *nn*:*nn*:*nn*:*nn*:*nn*:*nn*. For example, `0000.5e00.5355` or `00:00:5e:00:53:55`.

publish

(Optional) Have the router or switch reply to ARP requests for the specified IP address. If you omit this option, the router or switch uses the entry to reach the destination but does not reply to ARP requests.

> **NOTE**: For unicast MAC addresses only, if you include the `publish` option, the router or switch replies to proxy ARP requests.

gratuitous-arp-delay

Configure a delay for gratuitous ARP requests at the system level. By default, Junos OS sends gratuitous ARP requests immediately after network-related configuration changes are made on an interface (for example, a VLAN ID, MAC address, IP address change, or Aggregated Ethernet deployment). This might lead to the Packet Forwarding Engine dropping some initial request packets if the configuration updates have not been fully processed. To avoid such request packets being dropped, you can configure a delay in gratuitous ARP requests.

- Values:
  - *seconds*—Configure the ARP request delay in seconds. We recommend configuring a value in the range of 3 through 6 seconds.

gratuitous-arp-on-ifup

Add this statement to the `[edit system arp]` hierarchy to configure Junos OS to automatically issue a gratuitous ARP announcement when an interface is online.

interfaces aging-timer *minutes*

Specify the ARP aging timer in minutes for a logical interface of family type `inet`. The ARP aging timer is the time between ARP updates.

- **Default:** 20
- **Range:** 1 through 600,000

non-subscriber-no-reply Configure the device to reply to ARP requests from subscribers only. Do not reply to ARP requests from non-subscribers.

passive-learning Configure backup VRRP routers or switches to learn the ARP mappings (IP-to-MAC address) for hosts sending the requests. By default, the backup VRRP router drops these requests; therefore, if the primary router fails, the backup router must learn all entries present in the ARP cache of the primary router. Configuring passive learning reduces transition delay when the backup router is activated. Learning of ARP mappings (IP-to-MAC address) by backup VRRP routers or switches for hosts sending the requests is disabled unless this statement is configured.

purging Purge obsolete ARP entries from the cache when an interface or link goes offline.

respond-out-of-subnet Respond to ARP requests from a source that is not directly attached to the local subnet.

> **NOTE**: See PR 1710699 for details on support for the `respond-out-of-subnet` option.

unicast-mode-on-expire Send a unicast ARP request instead of the default broadcast request when an ARP cache entry ages out. When you include this option, the host device sends the requests only to the expected (currently cached) address. The ARP retry requests are unicast at intervals of 5 seconds. When you do not configure the `unicast-mode-on-expire` option, ARP retries are broadcast at intervals of 800 milliseconds.

This option reduces the amount of broadcast traffic normally sent to resolve expiring addresses. It also supports a special use case where access nodes are configured not to forward broadcast ARP requests towards customer CPEs for security reasons and instead translate ARP broadcasts to unicast requests.

> **NOTE**: This option affects only the update requests. Initial ARP requests are broadcast as usual.

arp-detect

IN THIS SECTION

- Syntax | 2463
- Hierarchy Level | 2464
- Description | 2464
- Options | 2464
- Required Privilege Level | 2464
- Release Information | 2465

Syntax

```
arp-detect milliseconds;
```

Hierarchy Level

```
[edit forwarding-options next-hop]
```

Description

Define the length of time (in milliseconds) for an SPU to wait for an acknowledgement from the Routing Engine that an ARP request has been received from the SPU. If the Routing Engine fails to respond within the specific time interval, the SPU considers that the Routing Engine CPU utilization is high at that moment, and initiates the ARP throttling. ARP throttling is initiated on the logical interface, where the incoming packet had triggered the ARP request.

Configuring a shorter ARP detect time interval results in triggering of ARP throttling more frequently. Frequent ARP throttling is useful for lowering Routing Engine CPU utilization caused by excessive ARP requests.

For example, when you configure the `set forwarding-options nexthop arp-detect 300` option, the nexthop resolution request must be acknowledged by the Routing Engine within 300 milliseconds. If the SPU does not get an acknowledgment from the Routing Engine in 300 milliseconds, the logical interface which had received the packet that triggered the nexthop request, changes into ARP throttle state. While the ARP throttle state is active for that interface, traffic entering into that interface does not trigger new nexthop resolution requests.

> **CAUTION**: We recommend that only advanced Junos OS users attempt to configure ARP throttle and ARP detect feature. Because, improper configuration might result in high CPU utilization of Routing Engine affecting other processes on your device.

Options

milliseconds—Number of seconds the SPU waits before receiving a response from Routing Engine.

- **Range:** 1 through 10000 milliseconds
- **Default:** 10000 milliseconds

Required Privilege Level

security—To view this statement in the configuration.

arp-inspection

IN THIS SECTION

- Syntax | 2467
- Hierarchy Level | 2467
- Description | 2467
- Default | 2468
- Required Privilege Level | 2468
- Release Information | 2468

Syntax

```
arp-inspection {
    forwarding-class class-name;
}
```

Hierarchy Level

- For platforms with ELS:

```
[edit vlans vlan-name forwarding-options dhcp-security],
[edit forwarding-options dhcp-relay ]
```

- For platforms without ELS:

```
[edit ethernet-switching-options   secure-access-port vlan (all | vlan-name)],
[edit forwarding-options dhcp-relay ]
```

Description

Perform dynamic ARP inspection (DAI) on all VLANs or on the specified VLAN.

When DAI is enabled, the switch logs invalid ARP packets that it receives on each interface, along with the sender's IP and MAC addresses. ARP probe packets, which have the sender IP address 0.0.0.0, are validated by DAI.

NOTE: If you configure DAI at the `[edit vlans vlan-name forwarding-options dhcp-security]` hierarchy level:

- DAI can be configured only for a specific VLAN, not for a list or a range of VLAN IDs.
- DHCP snooping is automatically enabled on the specified VLAN.
- The `forwarding-class` statement is not available at the `[edit vlans vlan-name forwarding-options dhcp-security]` hierarchy level.

See *Enabling Dynamic ARP Inspection (ELS)* for more information about this configuration.

> **NOTE**: On EX9200 switches, DAI is not supported in an MC-LAG scenario.

The remaining statement is explained separately.

Default

Disabled.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.0.

Hierarchy level `[edit vlans vlan-name forwarding-options dhcp-security]` introduced in Junos OS Release 13.2X50-D10. (See Using the Enhanced Layer 2 Software CLI for information about ELS.)

Syntax

```
arp-l2-validate
```

Hierarchy Level

```
[edit interfaces irb]
```

Description

Enables periodic checking of ARP Layer 3 addressing and MAC Layer 2 addressing tables, and fixes entries if they become out of sync.

Normally, the ARP and MAC address tables stay synchronized. However, you can configure this option on the `irb` interface of the switch to help avoid traffic loss in network conditions that might cause unresolved inconsistencies to occur between the ARP and MAC address tables, such as:

- When link flapping occurs in a multichassis link aggregation (MC-LAG) group, and the network is attempting to achieve convergence. In this case, frequent MAC table updates are happening, and occasionally a corresponding ARP table update might be lost.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

- Release Information | 2476

Syntax

```
policer name {
    filter-specific;
        logical-interface-policer;
        physical-interface-policer;
        if-exceeding {
        (bandwidth-limit bits per second | bandwidth-percent percent);
        burst-size-limit bytes;
    then <discard> <forwarding-class forwarding-class> <loss-priority (high | low | medium-high
| medium-low)> <out-of-profile>;
}
```

Hierarchy Level

```
[edit firewall]
```

Description

Apply a policer to an interface. Configure policer rate limits and actions. The traffic to the Routing Engine is controlled by applying the policer on ARP. This prevents network congestion caused by broadcast storms.

A policer applies two types of rate limits on traffic:

- Bandwidth—The number of bits per second permitted, on average
- Maximum burst size—The maximum size permitted for bursts of data that exceed the given bandwidth limit

Options

name	Policer name.
filter-specific	Policer is filter-specific.
logical-interface-policer	Policer is a logical interface policer.
physical-interface-policer	Policer is a physical interface policer.

The remaining statements are explained separately. See CLI Explorer.

arp-prefix-limit (Host Fast Reroute)

IN THIS SECTION

- Syntax | 2477
- Hierarchy Level | 2477
- Description | 2477
- Default | 2478
- Options | 2478
- Required Privilege Level | 2478
- Release Information | 2479

Syntax

```
arp-prefix-limit number;
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-instances instance-name routing-options
interface interface-name],
[edit routing-instances instance-name routing-options interface interface-name]
```

Description

Override the ARP prefix limit for the specified host fast-reroute (HFRR) profile.

When you configure HFRR, an optional ARP prefix limit sets a maximum for the number of ARP routes and, therefore FRR routes created for each HFRR profile in the routing table. This limit prevents ARP attacks from exhausting the virtual memory on the routing devices.

There are two configuration statements (`global-arp-prefix-limit` and `arp-prefix-limit`) that set the ARP prefix limit, one at the global `[edit routing-options host-fast-reroute]` hierarchy level and the other at the `[edit routing-instances instance-name routing-options interface interface-name]` hierarchy level, respectively. The global `global-arp-prefix-limit` statement sets a default ARP prefix limit for all HFRR profiles

configured on the routing device. The `arp-prefix-limit` statement overrides the `global-arp-prefix-limit` for that HFRR profile for that protected interface.

Warning system log messages begin when the ARP routes in an HFRR profile reaches 80% of the configured limit. When the number crosses the 100% threshold, the HFRR profile is deactivated. When this happens, all ARP/FRR routes are deleted from the routing table. FRR routes are deleted from forwarding table as well.

After the HFRR profile is deactivated, a blackout timer is started. The timeout value of this timer is the ARP cache timeout (kernel timeout) + the supplementary blackout timer.

There are global and per-HFRR CLI statements (`global-supplementary-blackout-timer` and `supplementary-blackout-timer`) to configure the supplementary blackout timer. The global value is at the `[edit routing-options host-fast-reroute]` hierarchy level and applies to all HFRR profiles on the routing device. The value for the routing-instance interface is at the `[edit routing-instances` *`instance-name`* `routing-options interface` *`interface-name`*`]` hierarchy level, and overrides the global value for that HFRR profile only.

When the blackout timer expires, the HFRR profile is reactivated, and the Junos OS relearns the ARP routes and re-creates the HFRR routes. If the ARP prefix limit is not exceeded again, the HFRR routes will be up.

If an HFRR profile is in the deactivated state, a reevaluation of the ARP state is preformed during every commit operation or whenever the routing process (rpd) is restarted with the `restart routing` command.

Default

If you omit the-`arp-prefix-limit` statement, the `global-arp-prefix-limit` takes effect for all HFRR profiles on the device. If you omit both of these statements, there is no ARP prefix limit for host fast reroute.

Options

number Maximum number of ARP HFRR routes allowed.

- **Range:** 1 through 10,000 HFRR routes

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.2.

- Options | 2481
- Required Privilege Level | 2481
- Release Information | 2481

Syntax

```
arp-system-cache-limit number;
```

Hierarchy Level

```
[edit system]
```

Description

Specify the ARP cache next-hop limit at the system (global) level to restrict the number of next-hop routes. To configure the limit at the interface level, use the "arp-max-cache" on page 2471 statement.

The default behavior of ARP is to remove the cache entry if it is not used within a certain period of time, and not to allow the cache to grow too large. You can also manage the number of ARP cache next-hop entries by configuring a limit to the maximum number of next hops that can be created.

Options

number Indicates the maximum number of routes to be held in the ARP cache.

- **Default:**
  - 20,000 (ACX Series routers, EX2200, EX2200-C, EX3200, and EX3300 switches, SRX Series Firewalls)
  - 75,000 (EX4200, EX4300, EX4500, EX4550, and EX6210 switches, MX Series routers)
  - 100,000 (Other platforms)
- **Range:** 1 through 2,000,000

Required Privilege Level

- Required Privilege Level | 2483
- Release Information | 2483

Syntax

```
arp-throttle seconds;
```

Hierarchy Level

```
[edit forwarding-options next-hop]
```

Description

Define the time duration (in seconds) for Address Resolution Protocol (ARP) request throttling to remain active when it is triggered.

When ARP throttling is triggered, it is active for a given logical interface. For the configured duration of time, the ARP throttling remains active, and the traffic entering into the specific interface does not

trigger ARP nexthop resolution requests, which are being sent to the Routing Engine from the specific SPU.

When you configure a longer time duration, the ARP throttling can protect the Routing Engine by preventing too many ARP requests being triggered by incoming traffic.

For example, if there is a large amount of traffic destined to a directly connected, unresolved IP address, chances of getting frequent ARP requests is very high, which eventually results into a high CPU load on the Routing Engine. By setting a longer time interval of the ARP throttle, the Routing Engine is protected from numerous ARP requests.

For example, when you configure the `set forwarding-options nexthop arp-throttle 15` option, and the interface state changes to throttle state, the nexthop requests triggered by incoming traffic into this interface, will not be sent. After 15 seconds, interface changes back from throttle to normal state. Then the nexthop requests triggered by the incoming traffic into this interface are sent to the Routing Engine again.

Options

seconds—Time interval (in seconds) for Address Resolution Protocol (ARP) request throttling to remain active when it is triggered.

- **Range:** 10 through 100 seconds
- **Default:** 10 seconds

Required Privilege Level

- Release Information | 2488

Syntax

```
as-list name {
    members [ members ... ];
}
```

Hierarchy Level

```
[edit logical-systems name policy-options],
[edit policy-options]
```

Description

Define a policy to specify a list of BGP autonomous systems (AS) to configure acceptable AS ranges for EBGP groups that can be used for bringing up BGP peers while establishing a BGP session. BGP accepts a peer request based on the specified AS range and rejects a peer request if the AS does not fall into the specified range. This allows you to control BGP peering when the neighbor's exact IP address is not known.

Options

name Specify a name to identify a BGP as-list.

members Specify a single autonomous system number or a range of autonomous system numbers in plain numbers.

Required Privilege Level

[edit routing-instances routing-instance-name protocols bgp group group-name neighbor address]
```

Description

Compare the AS path of an incoming advertised route with the AS number of the BGP peer under the group and replace all occurrences of the peer AS number in the AS path with its own AS number before advertising the route to the peer.

> **NOTE**: The `as-override` statement is specific to a particular BGP group. This statement does not affect peers from the same remote AS configured in different groups.

Enabling the AS override feature allows routes originating from an AS to be accepted by a router residing in the same AS. Without AS override enabled, the routing device refuses the route advertisement once the AS path shows that the route originated from its own AS. This is done by default to prevent route loops. The `as-override` statement overrides this default behavior.

Note that enabling the AS override feature may result in routing loops. Use this feature only for specific applications that require this type of behavior, and in situations with strict network control. One application is the IGP protocol between the provider edge routing device and the customer edge routing device in a virtual private network.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

[edit routing-options rib routing-table-name (aggregate | generate | static) (defaults | route)]
```

Description

Associate BGP autonomous system (AS) path information with a static, aggregate, or generated route.

In Junos OS Release 9.1 and later, the numeric range for the AS number is extended to provide BGP support for 4-byte AS numbers as defined in RFC 4893, *BGP Support for Four-octet AS Number Space*. RFC 4893 introduces two new optional transitive BGP attributes, AS4_PATH and AS4_AGGREGATOR. These new attributes are used to propagate 4-byte AS path information across BGP speakers that do not support 4-byte AS numbers. RFC 4893 also introduces a reserved, well-known, 2-byte AS number, AS 23456. This reserved AS number is called AS_TRANS in RFC 4893. All releases of Junos OS support 2-byte AS numbers.

In Junos OS Release 9.2 and later, you can also configure a 4-byte AS number using the AS-dot notation format of two integer values joined by a period: <*16-bit high-order value in decimal*>.<*16-bit low-order value in decimal*>. For example, the 4-byte AS number of 65,546 in plain-number format is represented as 1.10 in the AS-dot notation format. You can specify a value in the range from 0.0 through 65535.65535 in AS-dot notation format.

Default

No AS path information is associated with static routes.

Options

aggregator—(Optional) Attach the BGP **aggregator** path attribute to the aggregate route. You must specify the last AS number that formed the aggregate route (encoded as two octets) for ***as-number***, followed by the IP address of the BGP system that formed the aggregate route for ***ip-address***.

as-path—(Optional) AS path to include with the route. It can include a combination of individual AS path numbers and AS sets. Enclose sets in brackets ([ ]). The first AS number in the path represents the AS immediately adjacent to the local AS. Each subsequent number represents an AS that is progressively farther from the local AS, heading toward the origin of the path. You cannot specify a regular expression for ***as-path***. You must use a complete, valid AS path.

atomic-aggregate—(Optional) Attach the BGP **atomic-aggregate** path attribute to the aggregate route. This path attribute indicates that the local system selected a less specific route instead of a more specific route.

origin egp—(Optional) BGP origin attribute that indicates that the path information originated in another AS.

origin igp—(Optional) BGP origin attribute that indicates that the path information originated within the local AS.

origin incomplete—(Optional) BGP origin attribute that indicates that the path information was learned by some other means.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

[edit protocols evpn]
```

Description

Enable assisted replication (AR) in an EVPN network.

AR helps to optimize broadcast, unknown unicast, and multicast (BUM) traffic in EVPN networks. To enable AR, you configure devices in the EVPN network to operate as AR replicator and AR leaf devices. Use the statements in this hierarchy to define and set up AR replicators and AR leaf devices.

AR replicator devices help perform BUM traffic replication and forwarding tasks for AR leaf devices. When an AR leaf device receives BUM traffic, instead of always using ingress replication to the EVPN core, it forwards the traffic on an AR overlay tunnel to an AR replicator device that can better handle the replication load. The AR replicator device then replicates and forwards the traffic to other ingress replication overlay tunnels. You configure a loopback interface IP address on each AR replicator device for the AR overlay tunnel.

AR devices can interoperate with devices in the EVPN network that don’t support or are not configured into an AR device role.

Options

leaf Configure a device as an AR leaf device.

replicator Configure a device as an AR replicator device.

These statements and their options are explained in more detail separately.

assisted-replication {
    (fallback-replicator-ip fallback-replicator-ip | strict);
    replicator-ip replicator-ip;;
}
```

Hierarchy Level

```
[edit policy-options policy-statement name then]
```

Description

Configure routing policy actions in a routing policy for an assisted replication (AR) leaf device to deterministically steer multicast flows to specific AR replicator devices in an EVPN network.

Assign the routing policy to an EVPN instance on the AR leaf device using the `deterministic-ar-policy` statement at the `[edit routing-instances name protocols evpn assisted-replication leaf]` hierarchy level.

> **NOTE**: AR is a multicast traffic flow optimization feature where an ingress leaf device sends one copy of a multicast stream to another device called an AR replicator in the EVPN network. AR replicators are devices that can efficiently handle replicating and forwarding multicast streams to the other multicast receivers in the network. See *Assisted Replication Multicast Optimization in EVPN Networks* for details on how AR works and how to configure AR leaf and AR replicator devices.

When you assign routing policies with these actions on an AR leaf device, you control how the device load-balances multicast flows among the available AR replicator devices. The AR leaf device directs flows that match the routing policy's `from` conditions to the AR replicator device or devices you specify with this statement in the policy's `then` clause.

In the policy `from` clause, you can specify to match an IGMPv2 or MLDv1 multicast flow with either or both of the following parameters:

- A multicast group address.
- A bridge domain or VLAN-mapped virtual network identifier (VNI).

You can set match conditions for a source-specific multicast (SSM) IGMPv3 or MLDv2 multicast flow with any combination of the following parameters:

- A multicast group address.
- A bridge domain or VLAN-mapped virtual network identifier (VNI).
- A multicast source device address.

When you configure the `then` clause of the policy with the `assisted-replication` action statement we describe on this page, you must specify the `replicator-ip` option with the address of an AR replicator in the network.

You can configure the policy to direct matching flows strictly to that preferred AR replicator by including the `strict` option, which we call **strict mode**. In strict mode, if the preferred AR replicator goes down, the leaf device drops the matching traffic (even if the network has other available AR replicators).

By default, if you don't configure the `strict` option, the AR leaf device uses **loose mode**. In loose mode, you can include the `fallback-replicator-ip` option to configure the AR leaf device to use a fallback AR replicator if the preferred AR replicator goes down.

Also, consider the following cases in loose mode:

- You specify a fallback replicator, but both the preferred AR replicator and the fallback replicator go down.
- You don't specify a fallback replicator, and the preferred AR replicator goes down.

In those cases, if the AR leaf device detects other available AR replicators in the network, the device uses the default AR replicator load balancing method to distribute multicast traffic among the remaining available AR replicators.

Otherwise, if the AR leaf device doesn't detect any other AR replicators in the network, the device defaults to ingress replication behavior (replicates and forwards the multicast traffic itself to any interested receivers in the EVPN core).

Options

replicator-ip *replicator-ip*

(Required) Set a preferred AR replicator to which the AR leaf device directs the multicast flows that match the conditions in the policy statement's `from` clause.

The *`replicator-ip`* parameter is the secondary loopback address you assign for the AR replicator function when you configure a device as an AR replicator. For example:

```
[edit]
user@ar-replicator1# set interfaces lo0 unit 0 family inet address AR-IP-address

[edit]
```

```
user@ar-replicator1# set protocols evpn assisted-replication replicator inet AR-IP-address
```

See the "replicator" on page 14387 statement and the instructions in *Configure an AR Replicator Device*.

fallback-replicator-ip *fallback-replicator-ip*

(Optional) Set a fallback AR replicator to which the AR leaf device redirects the matching flows if the preferred AR replicator goes down.

The *fallback-replicator-ip* parameter is the AR replicator secondary loopback address of the device you want to use as the fallback device, similar to the address you specify with the `replicator-ip` option explained above.

strict

(Optional) Strictly use only the AR replicator(s) you specify with the `replicator-ip` option. The device doesn't redirect any flows to any other AR replicator if the specified AR replicator goes down; it drops any traffic the policy matches.

> **NOTE**: The `strict` and `fallback-replicator-ip` options are mutually exclusive.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Syntax

```
associate-lsp lsp-name {
    from from-ip-address;
}
```

Hierarchy Level

```
[edit protocols mpls label-switched-path lsp-name oam]
```

Description

Configure associated bidirectional label-switched paths (LSPs) on the two ends of an LSP for sending and receiving GAL and G-Ach OAM messages.

Options

from *from-ip-address* (Optional) Source address for the associated LSP configuration.

If omitted, this is derived from the `to` address of the ingress LSP configuration.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1.

association-timeout

IN THIS SECTION

- Syntax | 2515
- Hierarchy Level | 2515
- Description | 2515
- Options | 2515
- Required Privilege Level | 2516
- Release Information | 2516

Syntax

```
association-timeout time-in-minutes;
```

Hierarchy Level

```
[edit security sctp profile profile-name]
```

Description

Use the association-timeout parameter to set the association timeout for Stream Control Transmission Protocol (SCTP).

From Junos OS Release 20.4R1 onwards, the `[edit security gprs sctp profile profile-name]` hierarchy level is replaced by `[edit security sctp profile profile-name]`.

Options

time-in-minutes Number of minutes of association time that elapse before the session is terminated.

- **Range:** 10 through 6000 (100 hours).
- **Default:** 300 minutes (5 hours).

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.2. The association timeout range increased in Junos OS Release 12.1X45-D10.

asymmetric-hold-time

IN THIS SECTION

- Syntax | 2516
- Hierarchy Level | 2517
- Description | 2517
- Default | 2517
- Required Privilege Level | 2517
- Release Information | 2517

Syntax

```
asymmetric-hold-time;
```

Hierarchy Level

```
[edit protocols vrrp]
```

Description

Enable the VRRP primary router to switch over to the backup router immediately, without waiting for the priority hold time to expire, when a tracked route or interface goes down. When the route or interface comes back online, the original primary router that is now acting as the backup router waits for the priority hold time to expire before it reasserts primary role.

Default

`asymmetric-hold-time` is disabled.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.5.

- Syntax | 2518
- Hierarchy Level | 2518

- Description | 2518
- Default | 2518
- Required Privilege Level | 2518
- Release Information | 2518

Syntax

```
asymmetric-hold-time;
```

Hierarchy Level

```
[edit protocols vrrp]
```

Description

Configure a VRRP primary to fail over to a backup immediately—without waiting for the priority hold time to expire—when a tracked route goes down. Otherwise, the primary waits for the hold time to expire before it initiates a failover when a tracked interface or route goes down.

When the tracked interface or route comes up again, the new backup (original primary) router waits for the priority hold time to expire before it reasserts primary role.

Default

asymmetric-hold-time is disabled.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS 11.3.

```
options dhcp-relay dhcpv6...],
[edit routing-instances routing-instance-name forwarding-options dhcp-relay ...],
[edit routing-instances routing-instance-name forwarding-options dhcp-relay dhcpv6...]
```

Description

Set an asymmetric lease time for an address that is sent to the DHCP client instead of the actual lease time granted by the DHCP local server. The asymmetric lease time is shorter than the granted lease. Asymmetric leases require the DHCP client to renew the lease more frequently, at shorter intervals. If the client does not renew the short lease before it expires, the address is released sooner than if the original lease had been sent to the client, conserving address resources. Although you can configure the asymmetric lease on either the DHCP relay agent or the DHCP local server, in most situations, configuring the asymmetric lease on the relay agent is more useful.

Options

seconds Length of the short lease duration for the DHCPv4 client.

- **Range:** 600 through 65,534

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement in the configuration.

asynchronous-notification

IN THIS SECTION

- Syntax | 2523
- Hierarchy Level | 2523
- Description | 2523
- Default | 2524
- Required Privilege Level | 2524
- Release Information | 2524

Syntax

```
(asynchronous-notification | no-asynchronous-notification);
```

Hierarchy Level

```
[edit interfaces ge-fpc/pic/port gigether-options]
```

Description

The **asynchronous-notification** feature allows supported interfaces to generate and transfer link down alarms. This feature triggers the laser off (LOS) signal on an interface based on specific events and conditions and sends the LOS alarm to its peer (CE).

When you configure the **asynchronous-notification** knob on an interface, the LOS signal will be triggered under the following conditions:

- **RPD CCC Down Event**: If the RPD (Routing and Policy Database) detects a CCC (Cross-Connect Circuit) down event, indicating a loss of connectivity for the associated service.
- **Interface Encapsulation:** If the interface encapsulation is set to ethernet-ccc, ethernet-vpls, or vlan-ccc.

The LOS alarm will be sent to the peer CE (Customer Edge) device in these cases. This functionality is particularly useful for port-based services.

> **NOTE**: You can only configure the "asynchronous-notification" knob at the Interface Device (IFD) level. The RPD determines the CCC down event on a per Interface Logical (IFL) basis, while the Packet Forwarding Engine (PFE) sets the LOS alarm on the port. Also, This feature is not recommended for IFL-based services.
>
> Also, the asynchronous-notification cannot be configured on aggregated Ethernet (ae) interfaces or their member links. Therefore, the LOS functionality triggered by the knob will not be available on ae interfaces.

By enabling the **asynchronous-notification** feature, you will receive timely notifications about link down events, allowing you to take appropriate actions or perform troubleshooting to ensure seamless network connectivity and service availability.

Default

Support for notification of link down alarm generation and transfer is not enabled.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.3.

IN THIS SECTION

- Syntax | 2554
- Hierarchy Level | 2554
- Description | 2554
- Options | 2554
- Required Privilege Level | 2555

Release Information | 2555

Syntax

```
attributes {
    preference (dsl | pon);
}
```

Hierarchy Level

```
[edit system access-line]
```

Description

Selects the set of access line attributes (TLVs) that is saved and processed when the router receives both DSL TLVs and PON TLVs in ANCP port status messages or in PPPoE-IA tags. The default line type is PON. You select the `dsl` options to prefer the DSL TLVs. For example, you might do this when the PON TLVs are unreliable, perhaps because of some issue with the OLT. The `preference` option has no effect when the BNG receives attributes of only one access line type from the OLT.

NOTE: The OLT might redundantly report the PON access line attributes both in PON TLVs and by overloading DSL TLVs. In this case, the DSL-Type TLV (0x91) is set to OTHER and PON rates for the access line are presented in the DSL TLVs, Actual-Net-Data-Rate-Upstream (0x81) and Actual-Net-Data-Rate-Downstream (0x82).

Options

preference dsl Specifies that the router saves and processes DSL TLVs from the DSL-Line-Attributes TLV 0x04. The router discards the PON-Access-Line-Attributes TLV (0x12) and the PON TLVs that it contains.

preference pon Specifies that the router saves and processes PON TLVs from the PON-Line-Attributes TLV 0x12. The router discards the DSL-Access-Line-Attributes TLV (0x04) and the DSL TLVs that it contains.

- **Default:** pon

attributes-match (Event Policy)

IN THIS SECTION

- Syntax | 2558
- Hierarchy Level | 2559
- Description | 2559
- Required Privilege Level | 2559
- Release Information | 2559

Syntax

```
attributes-match {
    event1.attribute-name equals event2.attribute-name;
    event.attribute-name matches regular-expression;
    event1.attribute-name starts-with event2.attribute-name;
}
```

Hierarchy Level

```
[edit event-options policy policy-name]
```

Description

Execute an event policy only if the attributes of two events are correlated or if the attribute of one event matches a regular expression.

If the `attributes-match` statement includes the `equals` or `starts-with` options, or if it includes a `matches` option that includes a clause for an event that is not specified at the `[edit event-options policy policy-name events]` hierarchy level, you must include one or more `within` statements in the same policy configuration.

You can include event policy variables within the statement to differentiate between a trigger event attribute and a correlated event attribute. You can use variables of the following forms:

- {$$.*attribute-name*}—The double dollar sign ($$) notation represents the event that is triggering a policy. When combined with an attribute name, the variable resolves to the value of the attribute associated with the triggering event.
- {$*event*.*attribute-name*}—The single dollar sign with the event name ($*event*) notation represents the most recent event that matches *event*. When combined with an attribute name, the variable resolves to the value of the attribute associated with that event.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

maintenance—To view or add this statement in the configuration.

Release Information

Statement introduced in Junos OS Release 7.5.

            vendor-attribute vsa-number;
        }
    }
}
```

Hierarchy Level

```
[edit access profile profile-name radius]
```

Description

Specify how the router or switch processes RADIUS attributes.

Options

"exclude" on page 6617

Configure the router or switch to exclude the specified attributes from being sent in the specified type of RADIUS message. Exclusion can be useful, for example, for attributes that do not change values over the lifetime of a subscriber. By not sending these attributes, you reduce the packet size without losing information. Contrast this behavior with that provided by the `ignore` statement.

The options for this statement are explained separately. Click the linked statement for details.

ignore

Configure the router or switch to ignore the specified attributes in RADIUS Access-Accept messages. Standard attributes and VSAs received in RADIUS messages take precedence over internally provisioned attribute values. Ignoring the attributes enables your internally provisioned values to be used instead. Contrast this behavior with that provided by the `exclude` statement.

Starting in Junos OS Release 18.1R1, you can specify RADIUS standard attributes with the attribute number. You can specify vendor-specific attributes (VSAs) with the IANA-assigned vendor ID and the VSA number. With this flexible configuration method, you can configure any standard attribute and VSA supported by your platform to be ignored. The

configuration has no effect if you can configure unsupported attributes, vendors, and VSAs.

The legacy method allows you to configure only those attributes and VSAs for which the statement syntax includes a specific option. Consequently, you can use the legacy method to ignore only a subset of all attributes that can be received in Access-Accept messages.

- Values:
  - dynamic-iflset-name—Ignore Juniper Networks VSA 26-130, Qos-Set-Name.
  - framed-ip-netmask—Ignore RADIUS attribute 9, Framed-IP-Netmask.
  - idle-timeout—Ignore RADIUS attribute 28, Idle-Timeout.
  - input-filter—Ignore Juniper Networks VSA 26-10, Ingress-Policy-Name.
  - logical-system-routing-instance—Ignore Juniper Networks VSA 26-1.
  - output-filter—Ignore Juniper Networks VSA 26-11, Egress-Policy-Name.
  - session-timeout—Ignore RADIUS attribute 27, Session-Timeout.
  - standard-attribute *number*—RADIUS standard attribute number supported by your platform. You can enclose multiple values in square brackets to specify a list of attributes. If you configure an unsupported attribute, that configuration has no effect. Range: 1 through 255.
  - vendor-attribute *vsa-number*—Number identifying a VSA belonging to the specified vendor; both must be supported by your platform. You can enclose multiple values in square brackets to specify a list of VSAs. If you configure an unsupported VSA, that configuration has no effect. Range: 1 through 255.
  - vendor-id *id-number*—IANA vendor ID supported by your platform. If you configure an unsupported vendor ID, that configuration has no effect. Range: 1 through 16777215.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Security Policies Overview

auth-entry

IN THIS SECTION

- Syntax | 2565
- Hierarchy Level | 2565
- Description | 2565
- Options | 2565
- Required Privilege Level | 2566
- Release Information | 2566

Syntax

```
auth-entry {
    maximum amount;
    reserved amount;
}
```

Hierarchy Level

```
[edit system security-profile]
```

Description

Specify the number of firewall authentication entries that user logical system administrators and primary logical system administrators can configure for their logical systems if the security profile is bound to the logical systems.

The primary administrator:

- uses security profiles to provision logical systems with resources.
- binds security profiles to user logical systems and the primary logical system.
- can configure more than one security profile, specifying different amounts of resource allocations in various profiles.

Only the primary administrator can create security profiles and bind them to logical systems.

Options

- `maximum` *`amount`*—A maximum allowed quota. If a logical system requires more of a resource than its reserved amount allows, it can utilize resources configured for the global maximum amount if they are available—that is, if they are not allocated to other logical systems. The maximum allowed quota specifies the portion of the free global resources that the logical system can use. The maximum allowed quota does not guarantee that the amount specified for the resource in the security profile is available. Logical systems compete for global resources.
- `reserved` *`amount`*—A reserved quota that guarantees that the resource amount specified is always available to the logical system.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.2.

auth-only-browser

IN THIS SECTION

- Syntax | 2566
- Hierarchy Level | 2567
- Description | 2567
- Options | 2567
- Required Privilege Level | 2567
- Release Information | 2567

Syntax

```
auth-only-browser <auth-user-agent [user-agent] >;
auth-only-browser;
```

Hierarchy Level

```
[edit security policies from-zone zone-name to-zone zone-name policy policy-name then permit
firewall-authentication pass-through]
[edit security policies from-zone zone-name to-zone zone-name policy policy-name then permit
firewall-authentication user-firewall]
```

Description

Configure firewall authentication to ignore non-browser HTTP/HTTPS traffic. This feature allows you to ensure that unauthenticated users issuing access requests through HTTP/HTTPS browsers are presented with a captive portal interface to allow them to authenticate. By default, firewall authentication responds to all HTTP/HTTPS traffic.

It can happen that non-browser HTTP/HTTPS services running in the background can trigger captive portal authentication, creating a race condition that suppresses presentation of the captive portal interface to the HTTP/HTTPS browser user.

When **auth-only-browser** is configured, non-browser HTTP traffic is dropped to allow for captive portal to be presented to unauthenticated users who request access using a browser.

Options

auth-user-agent ***user-agent***

Allow the SRX Series device to use the user-agent strings that you specify to verify that the browser traffic is HTTP/HTTPS traffic. Firewall authentication checks the strings against the User-Agent field in the browser header. You can specify only one value for this parameter. It must not contain spaces and it does not need to be enclosed in parenthesis. For example, **auth-user-agent** might specify Opera1 as one of its values.

You can use the **auth-user-agent** parameter alone for pass-through or user-firewall authentication or in conjunction with **auth-only-browser**.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1X49-D90.

auth-user-agent [user-agent];
```

Hierarchy Level

```
[edit security policies from-zone zone-name to-zone zone-name policy policy-name then permit
firewall-authentication pass-through]
[edit security policies from-zone zone-name to-zone zone-name policy policy-name then permit
firewall-authentication pass-through auth-only-browser]
[edit security policies from-zone zone-name to-zone zone-name policy policy-name then permit
firewall-authentication user-firewall]]
[edit security policies from-zone zone-name to-zone zone-name policy policy-name then permit
firewall-authentication user-firewall auth-only-browser]
```

Description

Specify a user-agent value to be used to verify that the user's browser traffic is HTTP/HTTPS traffic. Firewall authentication checks the value against the User-Agent field in the browser header. For example, the **auth-user-agent** parameter might specify Opera1 to be verified against the brower's User-Agent field for a match.

You can use the **auth-user-agent** parameter alone for pass-through or user-firewall authentication or in conjunction with **auth-only-browser**.

The **auth-only-browser** directs firewall authentication to ignore non-browser HTTP/HTTPS traffic to ensure that unauthenticated users using an HTTP/HTTPS browser are authenticated by captive portal before they are granted access to protected resources. It can happen that non-browser HTTP/HTTPS services running in the background can trigger captive portal authentication creating a race condition that suppresses presentation of the captive portal interface to the HTTP/HTTPS browser user.

Options

user-agent A string to be matched against values specified in the browser's User-Agent header field that identifies the traffic as HTTP/HTTPS browser traffic. You can specify only one user-agent value for a security policy configuration. The value must not contain spaces. You do not need to enclose the string in parenthesis. The length of a string must be 17 characters or less.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

```

```
name],
[edit routing-instances routing-instance-name protocols ospf area area-id virtual-link]
```

Description

Configure an authentication key (password). Neighboring routers use the password to verify the authenticity of packets sent from this interface.

All routers that are connected to the same IP subnet must use the same authentication scheme and password.

The remaining statements are explained separately. See CLI Explorer.

Options

simple-password *key*

Configures a simple authentication password string, defined by *key*.

md5

Configure an MD5 password.

- *key-identifier*—MD5 key identifier. Range is from 0 through 255. Default is 0.
- `key` *key-values*—One or more MD5 key strings. The MD5 key values can be from 1 through 16 characters long. You can specify more than one key value within the list. Characters can include ASCII strings. If you include spaces, enclose all characters in quotation marks (“ ”).
- `start-time` *time*—MD5 start date and time, in the format *YYYY-MM-DD.hh:mm*.

multi-active-md5

Configure authentication type MD5 with multi active keys

- *key-identifier*—multi active MD5 key identifier. Range is from 0 through 255. Default is 0.
- `key` *key-values*One or more MD5 key strings. The MD5 key values can be from 1 through 16 characters long. You can specify more than one key value within the list. Characters can include ASCII strings. If you include spaces, enclose all characters in quotation marks (“ ”).
- `delete-if-not-inuse`—Delete this key if not in use. This option added under `multi-active-md5` for an OSPF interface marks the key as old. If a new key is available on an OSPFv2 interface and once all the neighbors on the OSPFv2 interface use the new key, then OSPFv2 stops sending OSPFv2 packets with key that is marked as `delete-if-not-inuse`.

keychain *keychain*

For each keychain, you must specify a name. For example, ospf_auth. You can have multiple keychains on a routing device. For example, you can have a keychain for OSPF, a keychain for BGP, and a keychain for LDP.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

The option `keychain` *`keychain`* `introduced in Junos OS and Junos OS Evolved Release 23.4R1.`

    key (ascii-text key | hexadecimal key);
}
```

Hierarchy Level

```
[edit services (IPsec VPN) ipsec-vpn rule rule-name term term-name then manual direction direction]
```

Description

Configure IPsec authentication parameters for a manual security association (SA).

Options

algorithm Hash algorithm that authenticates packet data. The algorithm can be one of the following:

- **hmac-md5-96** Produces a 128-bit digest.
- **hmac-sha1-96** Produces a 160-bit digest.
- **hmac-sha-256-128** Produces a 256-bit digest, truncated to 128 bits.

key Type of authentication key. The key can be one of the following:

- **ascii-text key** ASCII text key. For `hmac-md5-96`, the key is 16 ASCII characters; for `hmac-sha1-96`, the key is 20 ASCII characters.
- **hexadecimal key** Hexadecimal key. For `hmac-md5-96`, the key is 32 hexadecimal characters; for `hmac-sha1-96`, the key is 40 hexadecimal characters.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Description

Configure an authentication algorithm type.

NOTE: Keep the following points in mind when you configure the authentication algorithm in an IPsec proposal:

- When both ends of an IPsec VPN tunnel contain the same IKE proposal but different IPsec proposals, an error occurs and the tunnel is not established in this scenario. For example, if one end of the tunnel contains router 1 configured with the authentication algorithm as hmac-sha- 256-128 and the other end of the tunnel contains router 2 configured with the authentication algorithm as hmac-md5-96, the VPN tunnel is not established.

- When both ends of an IPsec VPN tunnel contain the same IKE proposal but different IPsec proposals, and when one end of the tunnel contains two IPsec proposals to check whether a less secure algorithm is selected or not, an error occurs and the tunnel is not established. For example, if you configure two authentication algorithms for an IPsec proposal as hmac-sha-256-128 and hmac-md5-96 on one end of the tunnel, router 1, and if you configure the algorithm for an IPsec proposal as hmac-

md5-96 on the other end of the tunnel, router 2, the tunnel is not established and the number of proposals mismatch.

- When you configure two IPsec proposals at both ends of a tunnel, such as the `authentication-algorithm hmac-sha-256-128` and `authentication- algorithm hmac-md5-96` statements at the [`edit services ipsec-vpn ipsec proposal` *`proposal-name`*] hierarchy level on one of the tunnel, router 1 (with the algorithms in two successive statements to specify the order), and the `authentication-algorithm hmac-md5-96` and `authentication-algorithm hmac-sha-256-128` statements at the [`edit services ipsec-vpn ipsec proposal` *`proposal-name`*] hierarchy level on one of the tunnel, router 2 (with the algorithms in two successive statements to specify the order, which is the reverse order of router 1), the tunnel is established in this combination as expected because the number of proposals is the same on both ends and they contain the same set of algorithms. However, the authentication algorithm selected is hmac-md5-96 and not the stronger algorithm of hmac-sha-256-128. This method of selection of the algorithm occurs because the first matching proposal is selected. Also, for a default proposal, regardless of whether the router supports the Advanced Encryption Standard (AES) encryption algorithm, the 3des-cbc algorithm is chosen and not the aes-cfb algorithm, which is because of the first algorithm in the default proposal being selected. In the sample scenario described here, on router 2, if you reverse the order of the algorithm configuration in the proposal so that it is the same order as the one specified on router 1, hmac-sha-256-128 is selected as the authentication method.

- You must be aware of the order of proposals in an IPsec policy at the time of configuration if you want the matching of proposals to happen in a certain order of preference, such as the strongest algorithm to be considered first when a match is made when both policies from the two peers have a proposal.

Options

`algorithm`—Specify one of the following types of authentication algorithms:

- `aes-128-cmac-96`—Cipher-based message authentication code (AES128, 96 bits).
- `hmac-sha-1-96`—Hash-based message authentication code (SHA1, 96 bits).
- `md5`—Message digest 5.
- **Default:** `hmac-sha-1-96`

> **NOTE**: The default is not displayed in the output of the `show bgp bmp` command unless a key or key-chain is also configured.

Required Privilege Level

Description

Specify the router and route authentication to mitigate the risk of being attacked by a machine or router that has been configured to share incorrect routing information with another router. Router and route authentication enables routers to share information only if they can verify that they are talking to a trusted source, based on a password (key). In this method, a hashed key is sent along with the route being sent to another router. The receiving router compares the sent key to its own configured key. If they are the same, the receiving router accepts the route.

Options

authentication *algorithm-name* Configure the algorithm used to authenticate the specified BFD session.

- **Values:** Specify one of these algorithm names:
  - simple-password—Plain-text password. One to 16 bytes of plain text are used to authenticate the BFD session. One or more passwords can be configured. This method is the least secure and should be used only when BFD sessions are not subject to packet interception.
  - keyed-md5—Keyed Message Digest 5 hash algorithm for sessions with transmit and receive intervals greater than 100 ms. To authenticate the BFD session, keyed MD5 uses one or more secret keys (generated by the algorithm) and a sequence number that is updated periodically. With this method, packets are accepted at the receiving end of the session if one of the keys matches and the sequence number is greater than or equal to the last sequence number received. Although more secure than a simple password, this method is vulnerable to replay attacks. Increasing the rate at which the sequence number is updated can reduce this risk.
  - meticulous-keyed-md5—Meticulous keyed Message Digest 5 hash algorithm. This method works in the same manner as keyed MD5, but the sequence number is updated with every packet. Although more secure than keyed MD5 and simple passwords, this method can take additional time to authenticate the session.
  - keyed-sha-1—Keyed Secure Hash Algorithm I for sessions with transmit and receive intervals greater than 100 ms. To authenticate the BFD session, keyed SHA uses one or more secret keys (generated by the algorithm) and a sequence number that is updated periodically. The key is not carried within the packets. With this method, packets are accepted at the receiving end of the session if one of the keys matches and the sequence number is greater than the last sequence number received.
  - meticulous-keyed-sha-1—Meticulous keyed Secure Hash Algorithm I. This method works in the same manner as keyed SHA, but the sequence number is updated with every packet. Although more secure than keyed SHA and simple passwords, this method can take additional time to authenticate the session.

key-chain *key-chain-name*

Specify the name of an authentication keychain. The keychain name must match one of the keychains configured with the `key-chain` *`key-chain-name`* statement at the `[edit security authentication-key-chain]` hierarchy level.

The authentication keychain associates a security key with the specified BFD session. Each key has a unique start time within the keychain. Keychain authentication allows you to change the password information periodically without bringing down peering sessions. This keychain authentication method is referred to as *hitless* because the

keys roll over from one to the next without resetting any peering sessions or interrupting the routing protocol.

loose-check Specify loose authentication checking on the BFD session. Use loose authentication for transitional periods only when authentication might not be configured at both ends of the BFD session.

By default, strict authentication is enabled and authentication is checked at both ends of each BFD session. Optionally, to smooth migration from non-authenticated sessions to authenticated sessions, you can configure *loose checking*. When loose checking is configured, packets are accepted without authentication being checked at each end of the session.

- **Default:** Strict authentication is enabled. Specify loose-check to disable it.

Required Privilege Level

```

Description

Configure the parameters the router sends to the external AAA server. A group configuration takes precedence over a global DHCP relay configuration. Use the statement at the `[edit...dhcpv6]` hierarchy levels to configure DHCPv6 support.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.1.

Support at the `[edit ... dhcpv6]` hierarchy levels introduced in Junos OS Release 11.4.

Support at the [edit ... dual-stack-group *dual-stack-group-name*] hierarchy level introduced in Junos OS Release 15.1.

Specifying Authentication Support

authentication-entry-timeout (Identity Management Advanced Query)

IN THIS SECTION

- Syntax | 2597
- Hierarchy Level | 2597
- Description | 2597
- Options | 2598
- Required Privilege Level | 2598
- Release Information | 2598

Syntax

```
authentication-entry-timeout time-out-in-minutes;
```

Hierarchy Level

```
[edit services user-identification identity-management]
```

Description

Configure the time-out for the user identity authentication entries. You configure this parameter as part of the advanced user identity query feature for SRX Series Firewalls.

The advanced user identity query feature for SRX Series Firewalls relies on the Juniper Identity Management Service (JIMS), a centralized identity collection (CIC) system from which the SRX Series Firewall obtains the user identity information. It provides a global, end-to-end user identity management solution that allows you to provision users locally and have their authentication information made available to other sites in your network for policy enforcement and reporting.

WARNING: Before you use this feature, you must disable active-directory-access and authentication-source options under the user-identification hierarchy. You cannot commit this configuration if active directory authentication or the ClearPass query and webapi functions are configured and committed.

Options

time-out-in-minutes The amount of time after which a user identity authentication entry expires.

- **Range:** 0 or 10 through 1440 minutes. Specification of 0 indicates no time-out.
- **Default:** 60 minutes

Required Privilege Level

1. services—To view this statement in the configuration.
2. services-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1X49-D100.

authentication-entry-timeout (Services User Identification)

IN THIS SECTION

- Syntax | 2599
- Hierarchy Level | 2599
- Description | 2599
- Options | 2599
- Required Privilege Level | 2600
- Release Information | 2600

Syntax

```
authentication-entry-timeout minutes;
```

Hierarchy Level

```
[edit services user-identification authentication-source (Services User Identification ClearPass)
aruba-clearpass]
```

Description

Configure for the integrated ClearPass authentication and enforcement feature the timeout interval after which idle entries in the ClearPass authentication table expire.

Options

minutes Timeout interval. The timeout interval begins from when the user authentication entry is added to the ClearPass authentication table. If a value of 0 is specified, the entries will never expire.

- **Range:** 10 through 1440 minutes
- **Default:** 30 minutes

Required Privilege Level

1. services—To view this statement in the configuration
2. services-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3X48-D30.

authentication-key (Protocols MSDP)

IN THIS SECTION

- Syntax | 2600
- Hierarchy Level | 2600

[edit protocols msdp peer address],
[edit routing-instances routing-instance-name protocols msdp group group-name peer address],
[edit routing-instances routing-instance-name protocols msdp peer address]
```

Description

Associate a Message Digest 5 (MD5) signature option authentication key with an MSDP peering session.

Default

If you do not include this statement, the routing device accepts any valid MSDP messages from the peer address.

Options

peer-key—MD5 authentication key. The peer key can be a text string up to 16 letters and digits long. Strings can include any ASCII characters with the exception of (,), &, and [. If you include spaces in an MSDP authentication key, enclose all characters in quotation marks (“ ”).

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

[edit interfaces interface-name unit logical-unit-number family inet address address vrrp-
group group-id],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number
family inet address address vrrp-group group-id]
```

Description

Configure a Virtual Router Redundancy Protocol (VRRP) IPv4 authentication key. You also must specify a VRRP authentication scheme by including the `authentication-type` statement.

All devices in the VRRP group must use the same authentication scheme and password.

> **NOTE**: When VRRPv3 is enabled, the `authentication-type` and `authentication-key` statements cannot be configured for any VRRP groups.

Options

key—Authentication password. For simple authentication, it can be 1 through 8 characters long. For Message Digest 5 (MD5) authentication, it can be 1 through 16 characters long. If you include spaces, enclose all characters in quotation marks (“ ”).

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Description

Configure authentication keychains for TCP Authentication Option (TCP-AO) .

Table 3: Options

Option	Description
`key-chain`	Enter a unique name for the keychain. For example, `new-auth-key`.
`key`	Enter a unique key ID for each key. In a key-chain, keys are numbered sequentially, from `key` *0* through `key` *63*.
`secret`	Enter a unique secret key or password for each key. Use any alphanumeric characters without any space. Once configured, it will appear in an encrypted format.
`start-time`	Enter a time in *YYYY-MM-DD.HH:MM* format to specify the time when the control gets passed on from one key to the next. When a configured start time arrives (based on the device's clock), the key with that start time becomes active.
`algorithm`	Enter `ao` to indicate the authentication option.
`send-id`	Enter any two numbers between 0 and 255. You can also use the same number as the `send-id` and the `recv-id` of the same key. You must not use this numbers for any other key inside that key chain. You can configure up to 64 keys in a key-chain.
`recv-id`	Enter any two numbers between 0 and 255. You must not use this numbers for any other key inside that key chain. Reverse the `send-id` and `recv-id` values when you configure the same key in the receiving device.
`cryptographic-algorithm`	Choose a cryptographic algorithm. Starting in Junos OS Release 20.3R1, to be compliant to *RFC5925, The TCP Authentication Option*, we are supporting HMAC-SHA1 and AES-128 algorithms.

Table 3: Options *(Continued)*

Option	Description
`tcp-ao-option`	Choose enable to include the TCP-AO option. **NOTE**: The default value is disabled.

Required Privilege Level

admin—To view this statement in the configuration.

Required Privilege Level | 2622
Release Information | 2622

Syntax

```
authentication-key key;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols rsvp interface interface-name],
[edit logical-systems logical-system-name protocols rsvp peer-interface peer-interface-name],
[edit protocols rsvp],
[edit protocols rsvp interface interface-name],
[edit protocols rsvp peer-interface peer-interface-name]
```

Description

Authentication key (password). Neighboring routers use the password to verify the authenticity of packets sent from this interface or peer interface. To authenticate node hellos or remote messages between the Point of Local Repair (PLR) to the Merge Point (MP), enable `authentication-key` at the `[edit protocols rsvp]` hierarchy level.

It is recommended to use the `authentication-key` configuration at the `[edit protocols rsvp]` hierarchy level for the RSVP node-neighbor. Because non-RSVP interfaces do not have RSVP authentication key, the `authentication-key` configuration allows the packets to arrive at any interface regardless of RSVP interfaces configuration being enabled or not.

NOTE: To avoid fxp inheriting the `authentication-key` configuration statement, use specific physical interfaces such as <ge-*> and <ae*> in the group configuration. We don't recommend to use wildcard pattern <*>.

RSVP uses HMAC-MD5 authentication, which is defined in RFC 2104, *HMAC: Keyed-Hashing for Message Authentication*.

All routers that are connected to the same IP subnet must use the same authentication scheme and password.

Options

key—Authentication password. It can be 1 through 16 contiguous digits or letters. Separate decimal digits with periods. Separate hexadecimal digits with periods and precede the string with 0x. If you include spaces in the password, enclose the entire password in quotation marks (" ").

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Options

algorithm *algorithm-name*

Specify the algorithm to be used to authenticate the BFD session. You can use one of the following algorithms for authentication:

- keyed-md5
- keyed-sha-1
- meticulous-keyed-md5
- meticulous-keyed-sha-1
- simple-password

key-chain *key-chain-name*

Specify the name that is associated with the security key for the BFD session. The name you specify must match one of the keychains configured in the `authentication-key-chains key-chain` statement at the `[edit security]` hierarchy level.

loose-check

(Optional) Configure loose authentication checking on the BFD session. Use only for transitional periods when authentication might not be configured at both ends of the BFD session.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.3.

authentication-md5

IN THIS SECTION

- Syntax | 2625
- Hierarchy Level | 2625
- Description | 2625
- Required Privilege Level | 2625
- Release Information | 2625

Syntax

```
authentication-md5 {
    (authentication-key authentication-key | authentication-password authentication-password);
}
```

Hierarchy Level

```
[edit snmp v3 usm local-engine user username],
[edit snmp v3 usm remote-engine engine-id user username]
```

Description

Configure MD5 as the authentication type for the SNMPv3 user.

NOTE: You can only configure one authentication type for each SNMPv3 user.

For authentication, you can either enter a password in clear text, which is immediately encrypted, or, if you already have the encrypted version (known as a *key*), enter the key directly.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Configuring No Authentication

authentication-order

IN THIS SECTION

- Syntax | 2633
- Hierarchy Level | 2633
- Description | 2634
- Options | 2634
- Required Privilege Level | 2635
- Release Information | 2635

Syntax

```
authentication-order [ authentication-methods ];
```

Hierarchy Level

```
[edit access profile profile-name]
```

Description

Set the order in which AAA tries different authentication methods when verifying that a client can access the router or switch. For each login attempt, AAA tries the authentication methods in order, from first to last.

A given subscriber does not undergo both authentication and authorization as separate steps. When both `authentication-order` and `authorization-order` are specified, DHCP subscribers honor the configured authorization order, all other subscribers use the configured authentication-order.

Starting in Junos OS Release 18.2R1, the `password` option can also be used to specify that local authentication and local authorization is attempted for individual subscribers that are configured with the `subscriber` statement at the [`edit access profile` *`profile-name`*] hierarchy level.

Options

authentication-methods

Ordered list of methods to use for authentication attempts. The list includes one or more of the following methods in any combination:

- `nasreq`—Verify subscribers using the Diameter-based Network Access Server Requirements (NASREQ) protocol.

- `none`—No authentication is performed. Grants authentication without examining the client credentials. Can be used, for example, when the Diameter function Gx-Plus is employed for notification during subscriber provisioning.

  > **NOTE**: Subscriber access management does not support the `none` option; authentication fails when this option is specified.

- `password`—Verify the client using the information configured at the [`edit access profile` *`profile-name`* `client` *`client-name`*] hierarchy level.

  Subscriber access management does not support the `password` option until Junos OS Release 18.2R1. Starting in Junos OS Release 18.2R1, this option is used to enable local authentication and optionally local authorization for individual subscribers. Local authentication is typically used when you do not have external authentication and authorization servers. The password itself must be configured with the `subscriber` statement in the same access profile. Local authentication is performed when a subscriber logs in with a matching username; it succeeds if the subscribers login password matches the password in the profile.

If you have external authentication and authorization servers, you can use local authentication as a backup authentication method. In this case, configure password other than first in the list of methods.

- radius—Verify the client using RADIUS authentication services.
- s6a—Verify subscribers using the Diameter-based s6a protocol.
- **Default:** password

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

none option added in Junos OS Release 11.2.

nasreq option added in Junos OS Release 16.1.

s6a option added in Junos OS Release 19.3R1.

- Release Information | 2637

Syntax

```
authentication-order [(none | ldap | password | radius | s6a | saml | secureid)];
```

Hierarchy Level

```
[edit access profile profile-name]
```

Description

Configure the order of authentication, authorization, and accounting (AAA) methods to use while sending authentication messages.

Default

Not enabled

Options

`none`—No authentication for specified users.

When you enable `none` authentication option, the SRX Series Firewall no longer requires the RADIUS server to authenticate the initiator again with the common shared password used for IKEv2 configuration payload. This is because, the SRX Series Firewall already authenticates the remote peer using a certificated-based authentication. You can use this AAA profile in different combinations, but ensure that it is not used where you do not use a pre-authentication.

For example: Consider a scenario, where to establish a connection from a client to secure gateway IPsec tunnels, client is authenticated using certificates method as per IKE protocol. For simplicity, if you do not prefer dependency on RADIUS server and use local pool for address acquisition without any additional authentication, you can configure the “aaa” profile in IKE gateway hierarchy and set the `authentication-order` value as `none` in the access profile, as follows:

```
set access profile profile-name authentication-order none
set security ike gateway gateway name aaa access-profile profile-name
```

To start the Radius Accounting, use the following commands:

```
set access profile profile-anme radius-server 172.16.0.0 secret "$ABC123"
set access profile profile-name radius accounting-server 172.16.0.0
set access profile profile-name accounting order radius
```

`ldap`—Light weight directory access protocol.

`password`—Locally configured password in access profile.

`radius`—RADIUS authentication.

`s6a`—S6a authentication

`saml`—Security Assertion Markup Language

`securid`—RSA Secure ID authentication.

Required Privilege Level

admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.0.

`none` option introduced in Junos OS Release 20.3R1.

`saml` option added in Junos OS Release 24.4R1.

Syntax

```
authentication-order [dot1x | mac-radius | captive-portal];
```

Hierarchy Level

```
[edit logical-systems name protocols dot1x authenticator
interface],
[edit protocols dot1x authenticator interface interface-name]
```

Description

Configure the preferred order of authentication methods that the device will use when attempting to authenticate a client. If multiple authentication methods are configured on a single interface, when one authentication method fails, the device falls back to another method. You can configure the `authentication-order` statement to specify whether 802.1X authentication or MAC RADIUS authentication must be the first authentication method tried.

By default, the device attempts to authenticate a client by using 802.1X authentication first. If 802.1X authentication fails because there is no response from the client, and MAC RADIUS authentication is configured on the interface, the device falls back to MAC RADIUS authentication. If MAC RADIUS fails, and captive portal is configured on the device, the device falls back to captive portal.

Configuring MAC RADIUS authentication as the first method can help prevent the fallback timeout period which occurs after an 802.1X authentication attempt is made for a host that does not support 802.1X authentication. If MAC RADIUS authentication is configured as the first authentication method on an interface, then on receiving data from any client on that interface, the device attempts to authenticate the client by using MAC RADIUS authentication. If MAC RADIUS authentication fails, then the device falls back to 802.1X authentication. If 802.1X authentication fails, and captive portal is configured on the interface, the device falls back to captive portal.

802.1X authentication always has the highest priority, even if a client has been authenticated using another method. If the device receives an EAP packet from a client that has been authenticated using MAC RADIUS authentication, the device acknowledges the EAP packet and upgrades the authentication using 802.1X authentication credentials. Similarly, if a client has been authenticated through fallback to captive portal, and the device receives an EAP packet from that client, the device attempts to authenticate the client by using 802.1X authentication.

The device attempts authentication using only methods that are configured on the interface. If an authentication method is included in the authentication order, but is not configured on the interface, the device ignores that method and attempts authentication using the next method in the order that is enabled. However, if a method is enabled on the interface, but is not included in the authentication order, the device does not attempt using that method. For example, if captive portal is enabled for an interface, but the authentication order is configured as `[mac-radius dot1x]`, the authentication method for that interface does not fall back to captive portal.

The authentication order can be configured for all interfaces by using the `interface all` option. If the authentication order is configured for an individual interface, and there is also an authentication order configured for all interfaces, then the order for the individual interface is followed. If there is no authentication order configured for an individual interface, and there is an authentication order configured for all interfaces, then the configuration for all interfaces is followed.

Use the following guidelines when configuring the `authentication-order` statement:

- The authentication order must include at least two methods of authentication.

- 802.1X authentication must be one of the methods included in the authentication order.
- If captive portal is included in the authentication order, it must be the last method in the order.
- If `mac-radius-restrict` is configured on an interface, then the authentication order cannot be configured.

The valid combinations for `authentication-order` are as follows:

- `[dot1x mac-radius captive-portal]`
- `[dot1x captive-portal]`
- `[dot1x mac-radius]`
- `[mac-radius dot1x captive-portal]`

Default

If `authentication-order` is not configured, the device attempts to authenticate the client by using 802.1X authentication first, followed by MAC RADIUS authentication, and then captive portal, as follows:

1. 802.1X authentication—If 802.1X is configured on the interface, the device sends EAPoL requests to the end device and attempts to authenticate the end device through 802.1X authentication. If the end device does not respond to the EAP requests, the device checks whether MAC RADIUS authentication is configured on the interface.
2. MAC RADIUS authentication—If MAC RADIUS authentication is configured on the interface, the device sends the MAC RADIUS address of the end device to the authentication server. If MAC RADIUS authentication is not configured, the device checks whether captive portal is configured on the interface.
3. Captive portal authentication—If captive portal is configured on the interface, the device attempts to authenticate the end device by using this method after attempting any other configured authentication methods.

Options

`captive-portal`—Configure captive portal authentication in the order of authentication methods on the interface.

`dot1x`—Configure 802.1X authentication in the order of authentication methods on the interface.

`mac-radius`—Configure MAC RADIUS authentication in the order of authentication methods on the interface.

```

Hierarchy Level (Junos OS Evolved)

```
[edit system]
```

Description

Configure the order in which the software tries different user authentication methods when attempting to authenticate a user. For each login attempt, the software tries the authentication methods in order, starting with the first one, until the password matches.

Default

If you do not include the `authentication-order` statement, users are verified based on their configured passwords.

Options

authentication-order [*method1 method2...*]

Specify the order in which the software tries different authentication methods when attempting to authenticate a user.

- **Values:** One or more of the following authentication methods listed in the order in which they must be tried:
  - `password`—Use the password configured for the user with the `authentication` statement at the `[edit system login user]` hierarchy level.
  - `radius`—Use RADIUS authentication services.
  - `tacplus`—Use TACACS+ authentication services.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

        resume;
    }
    pap;
}
```

Hierarchy Level

```
[edit logical-systems protocols dot1x authenticator interface interface-name mac-radius]
[edit protocols dot1x authenticator interface interface-name mac-radius]
```

Description

Specify the protocol to be used by a supplicant to provide authentication credentials for MAC RADIUS authentication. The protocols supported for MAC RADIUS authentication are EAP-MD5, which is the default, Protected Extensible Authentication Protocol (EAP-PEAP), and Password Authentication Protocol (PAP).

Default

If `authentication-protocol` is not configured, the EAP-MD5 authentication protocol is used for MAC RADIUS authentication.

Options

eap-md5 Use the EAP-MD5 protocol for MAC RADIUS authentication. EAP-MD5 is an authentication method belonging to the Extensible Authentication Protocol (EAP) authentication framework. EAP-MD5 uses MD5 to hash the username and password. EAP-MD5 provides for a one-way client authentication. The server sends the client a random request for which the client must provide a response containing an encryption of the request and its password for establishing its identity.

eap-peap <resume> Use the EAP-PEAP protocol, also known as Protected EAP or PEAP, for MAC RADIUS authentication. EAP-PEAP is a protocol that encapsulates EAP within a potentially encrypted and authenticated Transport Layer Security (TLS) tunnel. By encapsulating the authentication process in a TLS tunnel, PEAP addresses the vulnerabilities of an EAP like EAP-MD5.

- **Syntax:** resume—(Optional) Enable faster authentication when reconnecting by resuming the TLS session.

pap Use the PAP authentication protocol for MAC RADIUS authentication. PAP provides a simple password-based authentication for users to establish their identity by using a two-way handshake. PAP transmits plaintext passwords over the network without encryption. PAP must be configured if the Lightweight Directory Access Protocol (LDAP), which supports only plaintext passwords for client authentication, is used for RADIUS authentication.

```
[edit snmp v3 usm local-engine user username],
[edit snmp v3 usm remote-engine engine-id user username]
```

Description

Configure the secure hash algorithm (SHA) as the authentication type for the SNMPv3 user.

NOTE: You can configure only one authentication type for each SNMPv3 user.

For authentication, you can either enter a password in clear text, which is immediately encrypted, or, if you already have the encrypted version (known as a *key*), enter the key directly.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

```

```
    }
}
```

Hierarchy Level

```
[edit services user-identification]
```

Description

Configure ClearPass as the authentication source for the integrated ClearPass authentication and enforcement feature.

The ClearPass Policy Manager (CPPM), as the authentication source and client of the SRX Series Firewall HTTP server, initiates a connection to the SRX Series Firewall using the Web API that the SRX Series Firewall exposes to it. The CPPM sends user authentication and identity information to the SRX Series Firewall across this connection using HTTP or HTTPS POST request messages.

`set authentication-source aruba-clearpass` command can be used to configure the Juniper Identity Management Service as the authentication-source.

Options

name	Aruba ClearPass authentication source name.
authentication-entry-timeout	Aruba ClearPass authentication entry timeout number. • **Range:** 10 through 1440 minutes
invalid-authentication-entry-timeout	Invalid authentication entry timeout number. • **Range:** 10 through 1440 minutes
no-user-query	Disable user query from ClearPass.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

1. services—To view this statement in the configuration.
2. services-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3X48-D30.

authentication-source (Services User Identification Device Identity)

IN THIS SECTION

- Syntax | 2662
- Hierarchy Level | 2662
- Description | 2662
- Options | 2663
- Required Privilege Level | 2663
- Release Information | 2663

Syntax

```
authentication-source (active-directory | network-access-controller)
```

Hierarchy Level

```
[edit services user-identification device-information]
```

Description

Specify the device identity authentication source. The integrated user firewall device identity authentication feature enables you to control access to resources based on the identity of the device and not that of the user of the device. Supported authentication sources include Active Directory and third-party network access systems.

The SRX Series Firewall obtains the device identity information for authenticated devices from the authentication source. After the SRX Series Firewall obtains the device information, it creates a device identity authentication table to use to store device identity entries.

The SRX Series Firewall searches the device identity authentication table for a device match when traffic issuing from a user's device arrives at the SRX Series Firewall. If it finds a match, the SRX Series Firewall searches for a matching security policy. If it finds a matching security policy, the security policy's action is applied to the traffic.

Options

active-directory

Specifies Microsoft Active Directory as the authentication source.

The SRX Series Firewall obtains the device identity information for authenticated devices from Active Directory. It reads the Active Directory domain controller event logs to obtain the IP addresses of devices logged into the domain and authenticated by Windows. Then, for each authenticated device, it obtains from the Active Directory LDAP server the names of the groups to which the device belongs, based on the IP addresses of the devices.

network-access-controller

Specifies the authentication source as that of a third-party network access controller (NAC) system. If your network environment is configured for a NAC solution and you decide to take this approach, the NAC system sends the device identity information to the SRX Series Firewall. The SRX Series Firewall exposes a RESTful Web services API implementation that enables you to send the device identity information to the SRX Series Firewall in a formal XML structure. If you take this approach, you must verify that your NAC solution works with the SRX Series Firewall.

Required Privilege Level

services—To view this statement in the configuration.

services-control—To add this statement to the configuration.

[edit interfaces interface-name unit logical-unit-number family inet address address vrrp-group group-id],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family inet address address vrrp-group group-id]
```

Description

Enable Virtual Router Redundancy Protocol (VRRP) IPv4 authentication and specify the authentication scheme for the VRRP group. If you enable authentication, you must specify a password by including the `authentication-key` statement. The specific type of authentication used by OSPF is encoded in this field.

All devices in the VRRP group must use the same authentication scheme and password.

> **NOTE**: When VRRPv3 is enabled, the `authentication-type` and `authentication-key` statements cannot be configured for any VRRP groups.

Options

authentication Authentication scheme:

- **simple** Use a simple password. The password is included in the transmitted packet, so this method of authentication is relatively insecure.
- **md5** Use the MD5 algorithm to create an encoded checksum of the packet. The encoded checksum is included in the transmitted packet. The receiving routing platform uses the authentication key to verify the packet, discarding it if the digest does not match. This algorithm provides a more secure authentication scheme.
- **Default:** none (no authentication is performed).

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

[edit protocols rip],
[edit protocols rip group group-name neighbor neighbor-name],
[edit routing-instances routing-instance-name protocols rip],
[edit routing-instances routing-instance-name protocols rip group group-name neighbor neighbor-
name]
```

Description

Configure the type of authentication for RIP route queries received on an interface.

Default

If you do not include this statement and the `authentication-key` statement, RIP authentication is disabled.

Options

type—Authentication type:

- `md5`—Use the MD5 algorithm to create an encoded checksum of the packet. The encoded checksum is included in the transmitted packet. The receiving routing device uses the authentication key to verify the packet, discarding it if the digest does not match. This algorithm provides a more secure authentication scheme.
- `none`—Disable authentication. If `none` is configured, the configured authentication key is ignored.
- `simple`—Use a simple password. The password is included in the transmitted packet, which makes this method of authentication relatively insecure. The password can be from 1 through 16 contiguous letters or digits long.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

```

Hierarchy Level

```
[edit logical-systems name protocols              dot1x],
[edit protocols dot1x]
```

Description

Specify the group of servers to be used for IEEE 802.1X or MAC RADIUS authentication for Port-Based Network Access Control, configure interfaces for 802.1x authentication, and configure static MAC bypass for 802.1x and MAC RADIUS authentication. 802.1X authentication is supported on interfaces that are members of private VLANs (PVLANs).

> **NOTE**: You cannot configure 802.1X user authentication on interfaces that have been enabled for Q-in-Q tunneling.

Default

802.1X authentication is disabled.

Options

authentication-profile-name *access-profile-name*

Specify the name of the access profile to be used for 802.1X or MAC RADIUS user authentication. The access profile is configured at the [edit access profile] hierarchy level and contains the RADIUS server IP address and other information used for authentication.

> **NOTE**: Access profile configuration is required only for 802.1X clients, not for static MAC clients.

- **Default:** No access profile is specified.

ip-mac-session-binding

Configure the switching device to check for an IP-MAC address binding in the DHCP, DHCPv6, or SLAAC snooping table before terminating the authentication session when the MAC address ages out. If the MAC address for the end device is bound to an IP address, then it will be retained in the Ethernet switching table, and the authentication session will remain active.

To configure this feature, you must also disassociate the authentication session table from the Ethernet switching table using the `no-mac-table-binding` statement. This extends the authentication session until the next re-authentication period.

> **NOTE**: This feature requires DHCP, DHCPv6, or SLAAC snooping to be enabled on the device.

- **Default:** Not enabled

no-mac-table-binding

Specify that the device not remove the session from the authentication session table when the MAC address ages out of the Ethernet switching table.

- **Default:** Not enabled

- Required Privilege Level | 2681
- Release Information | 2681

Syntax

```
authorization-order [ authorization-methods ];
```

Hierarchy Level

```
[edit access profile profile-name]
```

Description

Set the order in which AAA tries different methods to verify that a client is authorized access to the router or switch. For each login attempt, AAA tries the authorization methods in order, from first to last.

A given subscriber does not undergo both authentication and authorization as separate steps. When both `authentication-order` and `authorization-order` are specified, DHCP subscribers honor the configured authorization order, all other subscribers use the configured authentication-order.

Options

authorization-methods Ordered list of methods to use for authorization attempts. The list includes one or more of the following methods in any combination:

- `jsrc`—Use the JSRC application in an SRC environment to request authorization from the SAE when verifying that a subscriber can access the router or switch.
  - When you configure both this option and `authentication-order`, AAA ignores the authentication order setting for DHCP subscribers. For non-DHCP subscribers, AAA ignores the authorization order and applies only the authentication order.
  - When you configure only this option, AAA applies the authorization order to both DHCP and non-DHCP subscribers.
- `nasreq`—Use the NASREQ application to communicate with a NASREQ server for authorization of any subscriber type as an alternative to RADIUS authorization.
- `none`—No authorization is performed. Can be used, for example, when the Diameter function Gx-Plus is employed for notification during subscriber provisioning.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.6.

`nasreq` option added in Junos OS Release 16.1.

Description

Configure an auto-bandwidth template to define parameters that measure the available bandwidth and periodically trigger updates to RSVP and IGP. You can configure this option both at the IS-IS protocol level or at the IS-IS interface level.

Traffic samples are collected periodically at each statistics interval and the average SPRING bandwidth utilization is calculated. If this average value increases beyond the configured adjust threshold percentage, that is the last reported SPRING bandwidth, then RSVP adjusts the subscription percentage accordingly. which might cause RSVP LSP preemption, IGP updates, and further re-routing of RSVP LSPs. However, if the SPRING bandwidth utilization drops below the configured threshold, the RSVP subscription percentage is modified to reflect the increase. You can configure parameters such as the threshold, the collection interval, and the adjust interval as per your requirements.

CAUTION: Configure the `adjust-interval` and `statistics-interval` options appropriately to avoid scaling issues. You can fine tune these values based on route and label-switched path (LSP) scale.

Options

template *name*

Specify an auto-bandwidth template name with a maximum length of 64 characters.

adjust-interval

Specify the time interval after which the average bandwidth utilization is measured.

- **Range:** `30` through `3600` seconds
- **Default:** 900 seconds

adjust-threshold

Specify the percentage change threshold after which an action is triggered.

- **Range:** `0` through `100` percent
- **Default:** 10 percent

auto-bandwidth-subscription

Specify the threshold for RSVP subscription in percentage.

- **Range:** 0 through 200 percent
- **Default:** 100 percent

statistic-collection-interval Specify the time interval after which the traffic statistics is collected from the line cards.

- **Range:** 10 through 300 seconds
- **Default:** 60 seconds

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.3R1.

    minimum-bandwidth-adjust-threshold-value
    monitor-bandwidth;
    resignal-minimum-bandwidth
    sync-active-path-bandwidth
}
```

Hierarchy Level

```
[edit protocols mpls label-switched-path lsp-name]
```

Description

Allow an MPLS tunnel to automatically adjust its bandwidth allocation based on the volume of traffic flowing through the tunnel.

> **NOTE**: In calculating the value for `Max AvgBW` (relative to the ingress LSP), the sample collected during make before break (MBB) is ignored to prevent inaccurate results. The first sample after a bandwidth adjustment, or after a change in the LSP ID (regardless of path change), is also ignored.

Options

adjust-threshold-absolute ***adjust-threshold-absolute-value***	Configure an absolute value based threshold along with the percentage based threshold that helps avoid the bandwidth getting triggered for LSPs of both small and large bandwidth reservations.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Autoinstallation Overview

Configuring Autoinstallation of Configuration Files

auto-configuration (System)

IN THIS SECTION

- Syntax | 2689
- Hierarchy Level | 2690
- Description | 2690
- Options | 2690
- Required Privilege Level | 2691
- Release Information | 2691

Syntax

```
auto-configuration {
    traceoptions {
        file {
        filename;
            files number;
            match regular-expression;
```

```
            size maximum-file-size;
            (world-readable | no-world-readable);
        }
        flag flag;
        level (all | error | info | notice | verbose | warning);
        no-remote-trace;
    }
}
```

Hierarchy Level

```
[edit system]
```

Description

Configure the autoconfiguration process.

Options

`traceoptions`—Set the trace options.

- `file`—Configure the trace file information.
  - `filename`—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`. By default, the name of the file is the name of the process being traced.
  - `files` *`number`*—Maximum number of trace files. When a trace file named trace-file reaches its maximum size, it is renamed to `trace-file.0`, then `trace-file.1`, and so on, until the maximum number of trace files is reached. The oldest archived file is overwritten.

    If you specify a maximum number of files, you also must specify a maximum file size with the `size` option and a filename.

    `Range:` 2 through 1000 files

    `Default:` 10 files
  - `match` *`regular-expression`*—Refine the output to include lines that contain the regular expression.
  - `size` *`maximum-file-size`*—Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named `trace-file` reaches this size, it is renamed `trace-file.0`. When `trace-file` again reaches its maximum size, `trace-file.0` is renamed `trace-file.1` and `trace-file`

is renamed `trace-file.0`. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum number of files, you also must specify a maximum file size with the `size` option and a filename.

`Syntax:` x K to specify KB, x m to specify MB, or x g to specify GB

`Range:` 10 KB through 1 GB

`Default:` 128 KB

- `world-readable | no-world-readable`—By default, log files can be accessed only by the user who configures the tracing operation. The `world-readable` option enables any user to read the file. To explicitly set the default behavior, use the `no-world-readable` option.

- `flag`—Specify the tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags.
  - `all`—Trace all events.
  - `auth`—Trace VLAN authentication.
  - `configuration`—Trace configurations.
  - `interfaces`—Trace interface operations.
  - `io`—Trace I/O operations.
  - `rtsock`—Trace routing socket operations.
  - `ui`—Trace user interface operations.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

```

Description

Defines the parameters for creating dynamic VLAN (DVLAN) interface on receiving the first VLAN packet from the client.

Options

dynamic-profile *dynamic-profile*
Name of the dynamic profile.

session-timeout *seconds*
Duration of the active dynamic IP subscriber in seconds. If you do not configure the `session-timeout` value, the system does not delete the dynamic IP subscriber unless an active DHCP subscriber is available.

- Range: 600 thru 6000

network *network-address*
IPv4 network address.

username-include
As a part of subscriber authentication, you can define the username with the following strings:

- `delimiter`-Delimiter or separator character
- `domain-name`-Domain name
- `user-prefix`-User defined prefix
- `auth-server-realm`-Authentication server realm name
- `interface-name`-Interface name
- `source-address`-Source address

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

auto-conversion

IN THIS SECTION

- Syntax | 2704
- Hierarchy Level | 2704
- Description | 2704
- Required Privilege Level | 2705
- Release Information | 2705

Syntax

```
auto-conversion;
```

Hierarchy Level

```
[edit virtual-chassis]
```

Description

Enable automatic Virtual Chassis port (VCP) conversion (also called VCP autoprovisioning) in a Virtual Chassis.

VCP links connect members in a Virtual Chassis using supported VCP ports on the member switches. Ports that are supported as VCPs and are not dedicated VCPs or configured as VCPs by default must be converted into VCPs to use them to interconnect Virtual Chassis members. You can manually convert a supported port into a VCP port using the `request virtual-chassis vc-port` command, or when automatic VCP conversion is enabled, a port will be automatically converted into a VCP under the following conditions:

- LLDP is enabled on the interfaces for the members on both sides of the link. The two interfaces exchange LLDP packets to accomplish the port conversion.
- The Virtual Chassis must be preprovisioned with the switches on both sides of the link already configured in the members list of the Virtual Chassis using the `set virtual-chassis member` command.

- The ports on both ends of the link are supported as VCPs and are *not* already configured as VCPs.

You might want to invoke automatic VCP conversion when adding a new switch to an existing Virtual Chassis or adding a redundant VCP link between two existing members of a Virtual Chassis.

> **NOTE**: When automatic VCP conversion is enabled in a Virtual Chassis with switches that have dedicated VCPs (EX4200, EX4500, or EX4550 Virtual Chassis), if network or uplink ports are automatically converted into VCPs to create a redundant link with a dedicated VCP connection, you must reboot the Virtual Chassis to avoid creating a traffic loop within the Virtual Chassis. See *Troubleshooting an EX Series Virtual Chassis* for more information on this potential issue.

auto-dad (SLAAC Snooping)

IN THIS SECTION

- Syntax | 2706
- Hierarchy Level | 2706
- Description | 2706
- Options | 2706

Required Privilege Level | 2707
Release Information | 2707

Syntax

```
auto-dad {
    retries retry-count;
    retrans-interval seconds;
}
```

Hierarchy Level

```
[edit forwarding-options access-security slaac-snooping interface  (interface-name | all)]
```

Description

Configure parameters for Duplicate Address Detection (DAD) to be performed by the SLAAC snooping device. DAD is used by IPv6 clients to verify the uniqueness of addresses obtained through stateless address auto-configuration (SLAAC). DAD sends a Neighbor Solicitation message destined to the new address. If there is a reply, then the address is a duplicate; if the address is unique, it is assigned to the interface.

If DAD is disabled on the client side, or if DAD packets are dropped due to traffic congestion, the SLAAC snooping device can perform auto-DAD on the client's behalf. You can configure the number of times that DAD will attempt to verify the address and the length of time that DAD waits for a response before retransmission. The client address binding remains in a hold state until all transmissions are completed.

Options

retries ***retry-count***	Configure the number of times that auto-DAD sends a Neighbor Solicitation message to verify the uniqueness of an address obtained through SLAAC.
retrans-interval ***seconds***	Configure the interval between retransmissions of a Neighbor Solicitation message for auto-DAD.

Required Privilege Level

        mac mac-address;
```

```
    }
}
```

Hierarchy Level

```
[edit interfaces aeX esi]
[edit interfaces aeX unit logical-unit-number esi]
```

Description

Configure aggregated Ethernet interfaces and aggregated Ethernet logical interfaces to automatically derive Ethernet segment identifiers (ESIs) from the Link Aggregation Control Protocol (LACP) configuration.

We support the `lacp-pe-system-id-and-admin-key` option in the following environments:

- On Juniper Networks devices that support the automatic ESI feature and are multihomed in active-active mode in an EVPN-VXLAN overlay network.
- On Juniper Networks devices that support the automatic ESI feature and are multihomed in active-standby or active-active mode in an EVPN-MPLS overlay network.

We support configuring `type-1-lacp` and `type-3-system-mac` options in all-active multihome devices in EVPN-VXLAN and EVPN-MPLS overlay networks.

For more guidelines on configuring automatic ESI and information about how the ESI is derived, see *Understanding Automatically Generated ESIs in EVPN Networks*.

Options

lacp-pe-system-id-and-admin-key

Specify that the ESI is automatically derived from the system id and admin key in the LACP configuration for the aggregated Ethernet interface on the local device (actor).

> **NOTE**: In Junos OS 22.2R1,`lacp` was rename to `lacp-pe-system-id-and-admin-key`.

type-1-lacp

Specify that the ESI is automatically derived from the system id and admin key in the LACP configuration for the aggregated Ethernet interface on the remote device (partner).

type-3-system-mac

Specify that the ESI is automatically derived from the configured local-discriminator and mac options.

- local-discriminator *number*—Specify a unique number that will be used in conjunction with the mac option to create the ESI.

  Range: 0 through 16777215

- mac *mac-address*—Specify a system identfier in the form of a MAC address that will be used in conjunction with the local-discriminator to create the ESI.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

```

Description

Enable the router to process only the autodiscovery network layer reachability information (NLRI) update messages for VPWS and LDP-based Layer 2 VPN and VPLS update messages (BGP_L2VPN_AD_NLRI) (FEC 129).

Specifically, the `auto-discovery-only` statement notifies the routing process (rpd) to expect autodiscovery-related NLRI messages so that information can be deciphered and used by LDP, VPLS, and VPWS.

The `auto-discovery-only` statement must be configured on all provider edge (PE) routers in a VPLS or in a VPWS. If you configure route reflection, the `auto-discovery-only` statement is also required on provider (P) routers that act as the route reflector in supporting FEC 129-related updates.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.4R2.

options],
[edit logical-systems logical-system-name routing-options],
[edit routing-instances routing-instance-name routing-options],
[edit routing-options]
```

Description

Export routes between routing instances.

This statement enables you to leak routes between VPN routing and forwarding (VRF) instances that are locally configured on a provider edge (PE) router. Auto export is always applied on the local PE router, because it applies to only local prefix leaking by evaluating the export policy of each VRF and determining which route targets can be leaked. The standard VRF import and export policies affect remote PE prefix leaking.

You can use this statement as an alternative to using the VRF import and export policies.

Default

`auto-export` is disabled by default. If you want to export routes between routing instances, include the `auto-export` CLI statement at the [`edit routing-options`] or at the [edit routing-instances *routing-instance-name* routing-options] hierarchy levels. You can use the `show route export` CLI command to verify the route export information.

Options

family—Address family.

inet—IP version 4 (IPv4) address family.

multicast—Multicast routing information.

unicast—Unicast routing information.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

auto-image-upgrade

IN THIS SECTION

- Syntax | 2716
- Hierarchy Level | 2716
- Description | 2716
- Default | 2716
- Required Privilege Level | 2716
- Release Information | 2716

Syntax

```
auto-image-upgrade;
```

Hierarchy Level

```
[edit chassis]
```

Description

Enable automatic software download using Zero Touch Provisioning (ZTP).

If the `auto-image-upgrade` statement is included in the factory default configuration, then ZTP will start automatically when the device is booted up. Otherwise, ZTP will start with the first power cycle after the `auto-image-update` statement is configured.

The DHCP client compares the software package name in the DHCP server message to the name of the software package that booted the switch. If the software packages are different, the DHCP client downloads and installs the software package specified in the DHCP server message.

Before you upgrade software using automatic software download, ensure that you have configured DHCP services, including configuring a path to a boot server and a boot file. See the *Junos OS System Basics Configuration Guide* for information about using the CLI to configure DHCP services and settings.

Default

Automatic software download is disabled.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.6.

auto-load-rebalance

IN THIS SECTION

- Syntax | 2717
- Hierarchy Level | 2717
- Description | 2717
- Required Privilege Level | 2717
- Release Information | 2718

Syntax

```
auto-load-rebalance;
```

Hierarchy Level

```
[edit fc-fabrics fabric-name proxy]
```

Description

Configure the system to rebalance NP_Port link loads automatically on an FCoE-FC gateway proxy fabric if the link loads become unbalanced. Load rebalancing is a disruptive action that forces some or all sessions (depending on the configured load-balancing algorithm) to log out and then log in again. When sessions log in again, they are placed on NP_Port interfaces so that the link loads are balanced.

Required Privilege Level

storage—To view this statement in the configuration.

storage-control—To add this statement to the configuration.

Release Information

Command introduced in Junos OS Release 12.3.

auto-negotiation

IN THIS SECTION

- Syntax | 2720
- Hierarchy Level | 2720
- Description | 2720
- Default | 2723
- Options | 2723
- Required Privilege Level | 2723

Release Information | 2723

Syntax

```
(auto-negotiation | no-auto-negotiation) <remote-fault (local-interface-online | local-interface-
offline)>;
```

Hierarchy Level

```
[edit interfaces interface-name ether-options],
[edit interfaces interface-name gigether-options],
[edit interfaces ge-pim/0/0 switch-options switch-port port-number]
```

Description

For Gigabit Ethernet interfaces on EX Series devices enable auto-negotiation. Auto-negotiation is supported in some ACX devices. In ACX5448, ACX5448-D, ACX5448-M and ACX710, auto-negotiation is supported on 1G interface. Beginning with Junos 21.1R1 and beyond, no-auto-negotiation configuration through CLI is supported on ports 24 onwards on ACX5448 variants and port 16 onwards on ACX710 due to hardware limitation for SerDes lanes.

- `auto-negotiation`—Enables autonegotiation. This is the default.
- `no-auto-negotiation`—Disable autonegotiation. When autonegotiation is disabled, you must explicitly configure the link mode and speed.

When you configure Tri-Rate Ethernet copper interfaces to operate at 1 Gbps, autonegotiation must be enabled.

> **NOTE**: On EX Series switches, an interface configuration that disables autonegotiation and manually sets the link speed to 1 Gbps is accepted when you commit the configuration; however, if the interface you are configuring is a Tri-Rate Ethernet copper interface, the configuration is ignored as invalid and autonegotiation is enabled by default.

To correct the invalid configuration and disable autonegotiation:

1. Delete the `no-auto-negotiation` statement and commit the configuration.
2. Set the link speed to 10 or 100 Mbps, set `no-auto-negotiation`, and commit the configuration.

On EX Series switches, if the link speed and duplex mode are also configured, the interfaces use the values configured as the desired values in the negotiation. If autonegotiation is disabled, the link speed and link mode must be configured.

NOTE: 1G optical transceivers do not support auto-negotiation on EX4100 1G/10G uplink module (PIC 1/PIC 2) and EX4400 1G/10G interface. 1G-T supports auto-negotiation on these ports.

NOTE: On T4000 routers, the `auto-negotiation` command is ignored for interfaces other than Gigabit Ethernet.

NOTE: On ACX Series routers, when you configure fiber interfaces (fiber media mode) to operate at 1 Gbps, autonegotiation is enabled by default to negotiate the speed and duplex settings. You can disable autonegotiation on ACX Series routers, except ACX5448 routers, in the fiber media mode, by using the (`no-auto-negotiation`) statement, and commit the configuration. In copper interfaces (copper media mode), autonegotiation is enabled by default. To disable autonegotiation, you need to explicitly configure the link speed to 10 or 100 Mbps, set `no-auto-negotiation`, and commit the configuration.

NOTE: Auto-negotiation is not supported on ACX710 and ACX5448 at 10G speed.
1G mode is not supported on pic level port profile and port level port profile.

1G is supported in *no-autonegotiation* mode. This indicates link partner must disable autonegotiation.

Timing is not supported.

NOTE: The auto-negotiation parameter *link partner speed* is displayed based on local speed even when auto-negotiation is disabled on ACX710 and ACX5448.

> **NOTE**: For Gigabit Ethernet interfaces on NFX350 devices, `auto-negotiation` is enabled by default. The `no-auto-negotiation` command is ignored for Gigabit Ethernet interfaces on NFX350 devices.

For SRX Series Firewalls, when autonegotiatiation is disabled, you can set the `mdi-mode` to enable it in case of non-cross table.

From Junos OS Evolved Release 21.2R1, we support autonegotiation and link training using 400G DAC cable for PTX10001-36MR. This is not a default behavior. Use `auto-negotiation` under `[edit interfaces interface-name ether-options]` hierarchy level to enable autonegotiation and link training. Enabling autonegotiation automatically enables link training. This advertises configured speed on the interface hierarchy. It does not upgrade or downgrade speed based on peers advertised capability.

Autonegotiation and link training is supported only on one 400-Gigabit Ethernet interfaces (1x400G), two 200-Gigabit Ethernet interfaces (2x200G), and four 100-Gigabit Ethernet interfaces (4x100G) channelization.

Starting in Junos OS Release 22.1R1, we support auto-negotiation for 1G interface on ACX5448, ACX5448-D, ACX5448-M and ACX710. Use the existing `auto-negotiation | no-auto-negotiation` statement at the `[edit interfaces interface-name gigether-options]` hierarchy level to enable and disable auto-negotiation for 1G interfaces.

No auto-negotiation configuration through CLI will be supported from port 24 onwards on ACX5448 variants and port 16 onwards on ACX710 due to hardware limitation for serdes lanes. No-auto-negotiation configuration on unsupported ports will be ignored and alerted to the user with a PFE log message.

Table 4 on page 2722 shows the behaviour of auto-negotiation in different combinations.

Table 4: Behavior of auto-negotiation

Device (ACX5448/ACX710)	Peer device	Link status
auto-negotiation ON	auto-negotiation ON	UP
auto-negotiation ON	auto-negotiation OFF	Results in anomalous behaviour due to duplex mismatch
auto-negotiation OFF	auto-negotiation ON	Results in anomalous behaviour due to duplex mismatch

Table 4: Behavior of auto-negotiation *(Continued)*

Device (ACX5448/ACX710)	Peer device	Link status
auto-negotiation OFF	auto-negotiation OFF	UP (If the speed and duplex mode matches on both the ends) DOWN (If the speed or duplex mode does not match on both the ends)

Default

Autonegotiation is automatically enabled. No explicit action is taken after the autonegotiation is complete or if the negotiation fails.

Options

`remote-fault (local-interface-online | local-interface-offline)`—(Optional) For M Series, MX Series, T Series, TX Matrix routers, and ACX Series routers only, manually configure remote fault on an interface.

- **Default:** `local-interface-online`

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

- Required Privilege Level | **2726**
- Release Information | **2726**

Syntax

```
auto-provisioned;
```

Hierarchy Level

```
[edit virtual-chassis]
```

Description

Enable the auto-provisioned configuration mode for a Virtual Chassis Fabric (VCF).

When a VCF is autoprovisioned, you can plug and play leaf devices into your VCF. You do not need to manually configure the required VCF parameters. When you interconnect a leaf device into the VCF, the leaf device is automatically configured into the linecard role. All other required VCF settings also happen without further user action, such as configuring the member ID, setting fabric mode or mixed mode, and setting up the Virtual Chassis ports (VCPs).

For autoprovisioning to work:

- The leaf device must be zeroized or no VCF parameters have been previously set or configured on the device.
- You must interconnect the leaf device to a spine device using a 10-Gbps SFP+ or 40-Gbps QSFP+ link that is supported as a VCP and is not already converted into a VCP on *both* sides of the link. See for details.

If the VCF automatically sets fabric or mixed mode on a spine or leaf device during autoprovisioning, the VCF then automatically reboots the device to complete the configuration. The device must reboot to apply the mode settings and properly join the VCF. If you want to more deterministically control when a device reboots upon adding it to an autoprovisioned VCF, you can alternatively configure fabric or mixed mode settings manually and reboot the device yourself *before* interconnecting it into the VCF.

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

             }
        }
    }
}
```

Hierarchy Level

```
[edit security pki]
```

Description

Configure the automatic reenrollment of a local end-entity (EE) certificate. Auto-reenrollment requests that the issuing CA replace a device certificate before its specified expiration date.

Options

certificate-id Auto reenrollment configuration for certificate ID.

acme-key-id Specify the ACME account key identifier.

ca-profile-name Specify the name of the certificate authority (CA) profile to be used for automatic reenrollment. The CA certificate must be present to initiate reenrollment.

challenge-password Specify the password used by the certificate authority (CA) for enrollment and revocation. If the CA does not provide the challenge password, choose your own password.

re-enroll-trigger-time-percentage Specify the certificate reenrollment trigger as a percentage of the end-entity (EE) certificate's lifetime that remains before certificate reenrollment is initiated. For example, if the renewal request is to be sent when the certificate's remaining lifetime is 10 percent, then configure 10 for `re-enroll-trigger-time-percentage` value. The time at which the certificate reenrollment is initiated is based on the certificate expiry date.

- **Range:** 1 through 99

re-enroll-time This option allows you to trigger auto-re-enrollment ahead of the certificate expiration. You can configure the re-enrollment trigger time in days, or hours, or percentage.

- days *value*—Specify when to trigger re-enrollment in days.
- hours *value*—Specify when to trigger re-enrollment in hours.
- percentage *value*—Specify when to trigger re-enrollment in percentage. **Range**: 1 to 99.

If you configure both `re-enroll-trigger-time-percentage` and `re-enroll-time` options, then `re-enroll-time` configuration take precedence.

Starting Junos OS Release 23.1R1, you must configure either `re-enroll-trigger-time-percentage` or `re-enroll-time` for the `commit check` to be successful.

re-generate-keypair Specify new key pair generation for automatic certificate reenrollment. If this statement is not configured, the current key pair is used. If the key pair does not change, the CA does not issue new certificates. We recommend that a new key pair be generated during reenrollment as it provides better security.

scep-digest-algorithm SCEP digest algorithm.

- Values:
  - md5—Use MD5 as SCEP digest algorithm
  - sha1—Use SHA1 as SCEP digest algorithm

scep-encryption-algorithm SCEP encryption algorithm.

- Values:
  - des—Use DES as SCEP encryption algorithm
  - des3—Use DES3 as SCEP encryption algorithm

cmpv2 Configure automatic reenrollment of a local certificate using CMPv2.

scep Configure automatic reenrollment of a local certificate using Simple Certificate Enrollment Protocol (SCEP).

acme You can configure the ACME auto re-enrollment.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement modified in Junos OS Release 9.0. `cmpv2` and `scep` options added in Junos OS Release 15.1X49-D40.

Support for `re-enroll-time (days value| hours value| percentage value)` option added in Junos OS Release 21.4R1.

The acme optioin added in Junos OS Release 22.4R1.

[edit logical-systems name tenants name routing-instances name protocols bgp group name link-
bandwidth],
[edit protocols bgp group name link-bandwidth],
[edit routing-instances name protocols bgp group name link-bandwidth]
```

Description

Enable auto-sensing of link-bandwidth and attaching the link-bandwidth community on a route at import. BGP can communicate link speeds to remote peers, enabling better optimization of traffic distribution for load balancing. This facilitates the integration of devices with different transmission speeds within the network, enabling efficient traffic distribution based on link speed.

Note that when more than one link-bandwidth community is attached to the route, BGP ignores transitivity and installs the lowest link-bandwidth value to the FIB, also known as the forwarding table

Options

hold-down Hold down in secs for link bandwidth auto-sense

- **Range:** 0 through 3600

auto-snapshot

IN THIS SECTION

- Syntax | 2741
- Hierarchy Level | 2741
- Description | 2741
- Default | 2742
- Required Privilege Level | 2742
- Release Information | 2742

Syntax

```
auto-snapshot;
```

Hierarchy Level

```
[edit system]
```

Description

Enable the automatic snapshot feature, which allows the device to automatically fix a corrupt Junos OS file in the primary root partition. If the automatic snapshot feature is enabled, the device automatically takes a snapshot of the Junos OS root file system in the alternate root partition and copies it onto the primary root partition, thereby repairing the corrupt file in the primary root partition. The automatic snapshot procedure takes place whenever the system reboots from the alternate root partition, regardless of whether the reboot is due to a command or due to corruption of the primary root partition.

NOTE: EX9200 devices do not support the automatic snapshot feature.

Default

- The automatic snapshot feature is enabled by default on the following EX Series devices:
  - EX4550 devices
  - EX Series devices that ship with Junos OS Release 12.3R1 or later
- The automatic snapshot feature is disabled by default on EX Series devices (except the EX4550 devices) running Junos OS Release 12.2 or earlier.
- If the automatic snapshot feature was disabled by default before the device was upgraded to Junos OS Release 12.3R1 or later, the feature remains disabled (for backward compatibility) by default after the upgrade.
- By default, the auto-snapshot feature is disabled on SRX300, SRX320, SRX340, SRX345, SRX380, and SRX550M devices.

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

auto-sw-sync

IN THIS SECTION

- Syntax | 2743
- Hierarchy Level | 2743
- Description | 2743
- Default | 2744
- Options | 2744
- Required Privilege Level | 2744
- Release Information | 2744

Syntax

```
auto-sw-sync node node-name (disable | enable);
```

Hierarchy Level

```
[edit system]
```

Description

(Junos OS Evolved only) When you add a new Routing Engine (RE) to the device and the new RE has a different software version than the rest of the system, by default the RE is kept out of the system. If you want a new RE's software and configuration to be automatically upgraded and synchronized with that of the cluster, configure this statement. Once configured for the device, if an RE fails and you replace the RE, the software and the configuration from the primary RE in the system automatically installs on the new RE.

When you configure this statement, the primary Routing Engine of the system copies over all the images (software and configuration) to the new Routing Engine and reboots the new Routing Engine so it runs the same software version and configuration as the primary Routing Engine. Each software image also contains the configuration running when the software image was last active.

When the chassis first comes up, the Routing Engines elect a "primary" node based on several factors, including which Routing Engine was "primary" last, which Routing Engine is the current hardware primary RE, and the slot position (0 versus 1).

Default

Disabled: When you insert a new Routing Engine with a different software version than the rest of the system and you have not already configured this statement on the system, the Routing Engine is kept out of the system. Thereafter, the newly-inserted RE does not respond to any software event and remains in its original software version.

Options

disable | enable (Required) Specify whether to disable or enable automatic software synchronization from the primary node to the new Routing Engine.

- Default: Disable

node *node-name* Specify the node to be synchronized (`fpc0` | `re0` | `re1`). Deprecated as of Junos OS Evolved Release 20.4R2.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Evolved Release 20.2R1.

`node` option deprecated as of Junos OS Evolved Release 20.4R2.

Replace a Routing Engine in a Dual-Routing Engine System

auto-sw-update

IN THIS SECTION

- Syntax | 2745
- Hierarchy Level | 2745
- Description | 2745
- Default | 2746
- Options | 2747
- Required Privilege Level | 2748
- Release Information | 2748

Syntax

```
auto-sw-update {
    (ex-4200 | ex-4300 | ex-4500 | ex-4600 | qfx-3 | qfx-5)
    package-name package-name;
}
```

Hierarchy Level

```
[edit virtual-chassis]
```

Description

Enable the automatic software update feature for Virtual Chassis or Virtual Chassis Fabric (VCF) configurations.

You should only use the keywords that specify a device or device family—`ex-4300`, `ex-4600`, `qfx-3`, and `qfx-5`—when configuring automatic software update on a mixed mode Virtual Chassis or Virtual Chassis Fabric (VCF). You can simply specify the *package-name* without specifying individual device keywords in non-mixed Virtual Chassis or VCF topologies.

NOTE: The automatic software update feature is not supported for a mixed mode EX4300 Virtual Chassis with a combination of EX4300 multigigabit model (EX4300-48MP) switches and other EX4300 switches.

You must enter the `auto-sw-update` statement multiple times—once for each device family in your mixed Virtual Chassis or VCF—in most scenarios when enabling the automatic software update for a mixed Virtual Chassis or VCF.

The Junos OS package for an EX4500 switch updates the software for EX4500 and EX4550 switches. You do not, therefore, need to specify the `ex-4500` keyword when configuring automatic software update for a mixed Virtual Chassis that include EX4500 and EX4550 switches only. You also only have to enter the `ex-4500` keyword once to configure automatic software update for all EX4500 and EX4550 member switches in the s37628)ame mixed Virtual Chassis.

The Junos OS package for a QFX3500 device updates the software for QFX3500 and QFX3600 devices. You do not, therefore, need to specify the `qfx-3` keyword when configuring automatic software update for a Virtual Chassis composed entirely of QFX3500 and QFX3600 devices. You also have to enter the `qfx-3` keyword only once to configure automatic software update for all QFX3500 and QFX3600 member devices in the same mixed Virtual Chassis.

The Junos OS package for a QFX5110 device updates the software for both QFX5110 and QFX5100 devices in a QFX5110 Virtual Chassis or VCF, so you do not need to specify the `qfx-5` keyword when configuring automatic software update for a QFX5110 Virtual Chassis or VCF composed of both types of devices.

CAUTION: A QFX5100 switch running a Junos OS software image with “-qfx-5-” in the package filename *must* first be upgraded to a Junos OS software image with “-qfx-5e-” in the package filename before it can be added to a mixed QFX5110 Virtual Chassis or VCF. The automatic software update process cannot update a switch from a “-qfx-5-” image to a “-qfx-5e-” image. See *Upgrading a QFX5100 Switch with a USB Device to Join a QFX5110 Virtual Chassis or Virtual Chassis Fabric*.

After a QFX5100 switch is installed with a “-qfx-5e-” Junos OS software image, the automatic software update process can successfully update the switch automatically with a different version of a “-qfx-5e-” Junos OS image to match the other members in the Virtual Chassis or VCF.

The remaining statement is explained separately. See CLI Explorer.

Default

The automatic software update feature is disabled.

Options

package-name *package-name*

Specify the software package name or a path to a Junos OS software image to update new members being added to a Virtual Chassis or VCF. .

- If the software package is located on a local directory on the switch, use the following format for *package-name*:

  /pathname/package-name

- If the software package is to be downloaded and installed from a remote location, use one of the following file access and transfer formats:

  `ftp://`*hostname/pathname/package-name*

  `ftp://`*username*`:`*prompt*`@ftp.`*hostname.net/package-name*

  `http://`*hostname/pathname/package-name*

ex-4200

Specify a path to a Junos OS image for an EX4200 switch when enabling automatic software update for a mixed EX4200 and EX4500 Virtual Chassis, mixed EX4200 and EX4550 Virtual Chassis, or mixed EX4200, EX4500, or EX4550 Virtual Chassis.

ex-4300

Specify a path to a Junos OS image for an EX4300 switch when enabling automatic software update for a mixed Virtual Chassis or VCF. Automatic software update is not supported for mixed mode EX4300 Virtual Chassis with a combination of EX4300 multigigabit model (EX4300-48MP) switches and other EX4300 switches, and this option is not applicable in that case.

ex-4500

Specify a path to a Junos OS image for an EX4500 switch, an EX4550 switch, or both types of switches when enabling automatic software update for a mixed EX4200 and EX4500 Virtual Chassis, mixed EX4200 and EX4550 Virtual Chassis, or mixed EX4200, EX4500, or EX4550 Virtual Chassis.

The Junos OS package for an EX4500 switch updates the software for EX4500 and EX4550 switches. Therefore, you only enter this command once to upgrade the EX4500 and EX4550 member switches in the same mixed Virtual Chassis.

The `ex-4500` keyword also does not need to be specified when configuring automatic software update for a mixed EX4500 and EX4550 Virtual Chassis.

ex-4600

Specify a path to a Junos OS image for an EX4600 switch when enabling automatic software update for a mixed Virtual Chassis.

qfx-3

Specify a path to a Junos OS image for a QFX3500, QFX3600, or both types of devices when enabling automatic software update for a mixed Virtual Chassis or VCF.

qfx-5 Specify a path to a Junos OS image for a QFX5100 device when enabling automatic software update for a mixed QFX5100 Virtual Chassis or VCF. You do not need to use this option for a QFX5110 Virtual Chassis or VCF that contains both QFX5110 and QFX5100 switches because the same software image runs on either type of switch.

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Description

(Satellite devices in a JNU group) Download a configuration file automatically from an FTP or HTTP server. When you power on a router or switch configured for autoinstallation, it requests an IP address from a Dynamic Host Configuration Protocol (DHCP) server. When the router or switch has an address, it sends a request to a configuration server and downloads and installs a configuration.

Options

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.3.

automatic-site-id

IN THIS SECTION

- Syntax | 2758
- Hierarchy Level | 2759
- Description | 2759
- Options | 2759
- Required Privilege Level | 2760
- Release Information | 2760

Syntax

```
automatic-site-id {
    collision-detect-time seconds;
    new-site-wait-time seconds;
    reclaim-wait-time minimum seconds maximum seconds;
    startup-wait-time seconds;
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols vpls
site site-name],
[edit routing-instances routing-instance-name protocols vpls site site-name]
```

Description

Enable automatic site identifiers for VPLS routing instances.

When you configure `automatic-site-id` for the first time, you must deactivate and then activate `protocol vpls`. However, if you already have `automatic-site-id` configured, you do not need to deactivate and then activate `protocol vpls`.

Options

`collision-detect-time`—The time in seconds to wait after a claim advertisement is sent to the other routers in a VPLS instance before a PE router can begin using a site identifier. If the PE router receives a competing claim advertisement for the same site identifier during this time period, it initiates the collision resolution procedure for site identifiers.

> **NOTE**: In the VPLS documentation, the word *router* in terms such as *PE router* is used to refer to any device that provides routing functions.

new-site-wait-time—The time in seconds to wait to receive VPLS information for a newly configured routing instance or a new site. This time interval is also applied whenever the automatic site identifier feature is activated on a VPLS routing instance other than at startup. Effectively, this timer indicates how long to wait before an attempt is made to allocate a site identifier. This timer is also triggered whenever a VPLS routing instance is enabled.

reclaim-wait-time—The time in seconds to wait to receive VPLS information for a newly configured routing instance or a new site. This time interval is also applied whenever the automatic site identifier feature is activated on a VPLS routing instance other than at startup. Effectively, this timer indicates how long to wait before an attempt is made to allocate a site identifier. This timer is also triggered whenever a VPLS routing instance is enabled. You can configure two values for this option: the **minimum** wait time and the **maximum** wait time.

startup-wait-time—The time in seconds to wait at startup to receive all the VPLS information for the route targets configured on the other PE routers included in the VPLS routing instance.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.1.

IN THIS SECTION

- Syntax | 2760
- Hierarchy Level | 2760
- Description | 2761
- Options | 2761
- Required Privilege Level | 2761
- Release Information | 2761

Syntax

```
automatic (random-allocation | round-robin);
```

Hierarchy Level

```
[edit services nat source pool nat-pool-name port]
```

Description

Configure automatic port assignment for source NAT with port translation, except for deterministic NAT. Automatic port assignment uses the port range 1024 through 65535. Specify either random allocation or round-robin allocation. Random allocation randomly assigns a port from the range 1024 through 65535 for each port translation. Round robin allocation first assigns port 1024, and uses the next higher port for each successive port assignment. Round robin allocation is the default.

Options

random-allocation	Randomly assigns a port from the range 1024 through 65535 for each port translation.
round-robin	First assigns port 1024, and uses the next higher port for each successive port assignment. Round robin allocation is the default.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 19.3R2.

```

Description

Specify the routing device's AS number.

An autonomous system (AS) is a set of routing devices that are under a single technical administration and that generally use a single interior gateway protocol (IGP) and metrics to propagate routing information within the set of routing devices. An AS appears to other ASs to have a single, coherent interior routing plan and presents a consistent picture of what destinations are reachable through it. ASs are identified by a number that is assigned by the Network Information Center (NIC) in the United States (http://www.isi.edu).

If you are using BGP on the routing device, you must configure an AS number.

The AS path attribute is modified when a route is advertised to an EBGP peer. Each time a route is advertised to an EBGP peer, the local routing device prepends its AS number to the existing path attribute, and a value of 1 is added to the AS number.

In Junos OS Release 9.1 and later, the numeric range is extended to provide BGP support for 4-byte AS numbers as defined in RFC 4893, *BGP Support for Four-octet AS Number Space*. RFC 4893 introduces two new optional transitive BGP attributes, AS4_PATH and AS4_AGGREGATOR. These new attributes are used to propagate 4-byte AS path information across BGP speakers that do not support 4-byte AS numbers. RFC 4893 also introduces a reserved, well-known, 2-byte AS number, AS 23456. This reserved AS number is called AS_TRANS in RFC 4893. All releases of Junos OS support 2-byte AS numbers.

In Junos OS Release 9.3 and later, you can also configure a 4-byte AS number using the AS-dot notation format of two integer values joined by a period: <*16-bit high-order value in decimal*>.<*16-bit low-order value in decimal*>. For example, the 4-byte AS number of 65,546 in plain-number format is represented as 1.10 in the AS-dot notation format.

Options

autonomous-system—AS number. Use a number assigned to you by the NIC.

- **Range:** 1 through 4,294,967,295 (2^{32} – 1) in plain-number format for 4-byte AS numbers

In this example, the 4-byte AS number 65,546 is represented in plain-number format:

```
[edit]
routing-options {
    autonomous-system 65546;
}
```

- **Range:** 0.0 through 65535.65535 in AS-dot notation format for 4-byte numbers

In this example, 1.10 is the AS-dot notation format for 65,546:

```
[edit]
routing-options {
    autonomous-system 1.10;
}
```

- **Range:** 1 through 65,535 in plain-number format for 2-byte AS numbers (this is a subset of the 4-byte range)

In this example, the 2-byte AS number 60,000 is represented in plain-number format:

```
[edit]
routing-options {
    autonomous-system 60000;
}
```

asdot-notation—(Optional) Display the configured 4-byte autonomous system number in the AS-dot notation format.

- **Default:** Even if a 4-byte AS number is configured in the AS-dot notation format, the default is to display the AS number in the plain-number format.

loops ***number***—(Optional) Specify the number of times detection of the AS number in the AS_PATH attribute causes the route to be discarded or hidden. For example, if you configure **loops 1**, the route is hidden if the AS number is detected in the path one or more times. This is the default behavior. If you configure **loops 2**, the route is hidden if the AS number is detected in the path two or more times.

- **Range:** 1 through 10

- **Default:** 1

> **NOTE**: When you specify the same AS number in more than one routing instance on the local routing device, you must configure the same number of loops for the AS number in each instance. For example, if you configure a value of 3 for the `loops` statement in a VRF routing instance that uses the same AS number as that of the master instance, you must also configure a value of 3 loops for the AS number in the master instance.
>
> Use the **independent-domain** option if the `loops` statement must be enabled only on a subset of routing instances.

The remaining statement is explained separately. See CLI Explorer.

autostate-exclude

IN THIS SECTION

- Syntax | 2769
- Hierarchy Level | 2769
- Description | 2770
- Required Privilege Level | 2770
- Release Information | 2770

Syntax

```
autostate-exclude;
```

Hierarchy Level

```
[edit interfaces interface-name ether-options]
```

Description

Specify not to include an IRB interface in the state calculation for VLAN members. The default behavior is not to exclude an IRB interface in the state calculation unless all the ports on the interface go down. Because an IRB interface often has multiple ports in a single VLAN, the state calculation for a VLAN member might include a port that is down, possibly resulting in traffic loss. This feature enables you to exclude a trunk or access interface from the state calculation, which results in the IRB interface being marked as down as soon as the port specifically assigned to a VLAN goes down.

IRB interfaces are used to bind specific VLANs to Layer 3 interfaces, enabling a switch to forward packets between those VLANs— without having to configure another device, such as a router, to connect VLANs. In a typical scenario, a port on the interface is assigned to a specific VLAN, while a different port on that interface is assigned to an 802.1Q trunk interface to carry traffic between multiple VLANs, and a third port on that interface is assigned to an access interface used to connect the VLAN to network devices.

To ensure that an interface is marked as down and thereby excluded from the state calculation for VLAN members when the port assigned to the VLAN goes down, configure this statement on the trunk or access interface. The trunk or port interface is automatically excluded from the state calculation of the IRB interface. In this way, when a port assigned to a specified VLAN goes down, the IRB interface assigned to that VLAN is also marked as down.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration

Description

Configure the threshold value for average frame delay, in microseconds, for two-way Ethernet frame delay measurement (ETH-DM). When the configured threshold for average frame delay is exceeded, an SNMP trap is generated for ETH-DM. SNMP traps are triggered if you configure either the average frame-delay threshold or the average inter-frame delay variance threshold. If you do not configure either the frame-delay threshold or the frame delay variation threshold, no SNMP traps are generated. You can configure these threshold values only with a two-way ETH-DM SLA iterator.

Frame delay refers to the difference, in microseconds, between the time a frame is sent and when it is received. Frame delay variation refers to the difference, in microseconds, between consecutive frame delay values. Frame delay variation is sometimes called “frame jitter.” For one-way Ethernet frame delay measurement, only the receiver MEP (on the remote system) collects statistics. For two-way Ethernet frame delay measurement, only the initiator MEP (on the local system) collects statistics.

Options

avg-fd-twoway-threshold-value—Threshold value for average frame delay, in microseconds, for two-way ETH-DM.

- **Range:** 1 through 4294967295 microseconds

`flap-trap-monitor` *seconds*—Duration in seconds, for summarizing flap occurrences and send out a single jnxSoamPm ThresholdFlapAlarm notification to the network management system (NMS).

```
[edit protocols oam ethernet connectivity-fault-management performance-monitoring sla-iterator-profiles
profile-name]
```

Description

Configure the threshold value for average frame loss ratio, in milli-percent, in the backward or downstream direction for Ethernet loss measurement (ETH-LM) and Ethernet synthetic loss measurement (ETH-SLM). When the configured threshold for average backward frame loss ratio is exceeded, an SNMP trap is generated for ETH-LM and ETH-SLM. SNMP traps are triggered if you configure either the average backward frame loss ratio threshold or the average forward frame loss ratio threshold. If you do not configure either the average backward frame loss ratio threshold or the average forward frame loss ratio threshold, no SNMP traps are generated. You can configure these threshold values with an SLA iterator for ETH-SLM and ETH-LM.

ETH-SLM is an application that enables the calculation of frame loss by using synthetic frames instead of data traffic. This mechanism can be considered as a statistical sample to approximate the frame loss ratio of data traffic.

Options

avg-flr-backward-threshold-value—Threshold value for average frame loss ratio in the backward or downstream direction, in milli-percent, for ETH-SLM and ETH-LM.

- **Range:** 1 through 100000 milli-percent

avg-ifdv-twoway-threshold avg-ifdv-twoway-threshold-value; {
flap-trap-monitor seconds; }
```

Hierarchy Level

```
[edit protocols oam ethernet connectivity-fault-management performance-monitoring sla-iterator-profiles
profile-name]
```

Description

Configure the threshold value for average frame delay variation, in microseconds, for two-way Ethernet frame delay measurement (ETH-DM). When the configured threshold for average frame delay variation is exceeded, an SNMP trap is generated for ETH-DM. SNMP traps are triggered if you configure either the average frame-delay threshold or the average inter-frame delay variance threshold. If you do not configure either the frame-delay threshold or the frame delay variation threshold, no SNMP traps are generated. You can configure these threshold values only with a two-way ETH-DM SLA iterator.

Frame delay refers to the difference, in microseconds, between the time a frame is sent and when it is received. Frame delay variation refers to the difference, in microseconds, between consecutive frame delay values. Frame delay variation is sometimes called “frame jitter.” For one-way Ethernet frame delay measurement, only the receiver MEP (on the remote system) collects statistics. For two-way Ethernet

frame delay measurement, only the initiator MEP (on the local system) collects statistics. In two-way ETH-DM mode, frame delay and frame delay variation values are based on the time difference between when the initiator MEP transmits a request frame and receives a reply frame from the responder MEP, subtracting the time elapsed at the responder MEP.

Options

avg-ifdv-twoway-threshold-value—Threshold value for average frame delay variation, in microseconds, for two-way ETH-DM.

- **Range:** 1 through 4294967295 microseconds

[edit security utm default-configuration anti-virus]
```

Description

The Avira scan engine is a licensed feature provided as a downloadable module. Download and install the Avira scan engine either through SRX with Internet connectivity to Juniper hosted URL, user hosted URL, or manually.

The Antivirus engine provides a full file-based virus scanning function which is available through a licensed subscription service. When your antivirus license key expires, you can continue to use the locally stored antivirus signatures without any updates. In case, the local database is deleted, antivirus scanning is also disabled.

Required Privilege Level

security— To view this statement in the configuration.

security-control— To add this statement to the configuration.

Release Information

The `[edit security utm default-configuration]` hierarchy level is introduced in Junos OS Release 18.2R1.

Statement introduced in Junos OS Release 18.4R1.

avp (L2TP Tunnel Switching)

IN THIS SECTION

- Syntax | 2785

backoff-period

IN THIS SECTION

- Syntax | **2792**
- Hierarchy Level | **2792**
- Description | **2792**
- Options | **2792**
- Required Privilege Level | **2793**
- Release Information | **2793**

Syntax

```
backoff-period milliseconds;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols pim interface (Protocols PIM)  interface-name
bidirectional df-election],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols pim
interface (Protocols PIM)  interface-name bidirectional df-election],
[edit protocols pim interface (Protocols PIM)  interface-name bidirectional df-election],
[edit routing-instances routing-instance-name protocols pim interface (Protocols PIM)  interface-
name bidirectional df-election]
```

Description

Configure the designated forwarder (DF) election backoff period for bidirectional PIM. The **backoff-period** statement configures the period that the acting DF waits between receiving a better DF Offer and sending the Pass message to transfer DF responsibility.

> **NOTE**: Junos OS checks rendezvous point (RP) unicast reachability before accepting incoming DF messages. DF messages for unreachable rendezvous points are ignored. This is needed to prevent the following example scenario. Routers A and B are downstream routers on the same LAN, and both are supposed to send DF election messages with an infinite metric on their upstream interfaces (reverse-path forwarding [RPF] interfaces). Router A has a higher IP address than Router B. When both routers lose the path to the RP, both send an Offer message with the infinite metric onto the LAN. Router A wins the election because it has a higher IP address, and Router B backs off as a result. After three Offer messages, according to RFC 5015, Router A looks up the RP and finds no path to the RP. As a result, Router A transitions to the Lose state and sends nothing. On the other hand, after backing off for an interval of 3 x the Offer period, Router B does not receive any messages, and resumes the DF election by sending a new Offer message. Hence, the pattern repeats indefinitely.

Options

milliseconds—Period that the acting DF waits between receiving a better DF Offer and sending the Pass message to transfer DF responsibility.

- **Range:** 100 through 65,535 milliseconds
- **Default:** 1000

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

backup-liveness-detection

IN THIS SECTION

- Syntax | 2799
- Hierarchy Level | 2799
- Description | 2799
- Required Privilege Level | 2800
- Release Information | 2800

Syntax

```
backup-liveness-detection {
    backup-peer-ip ipv4-address;
}
```

Hierarchy Level

```
[edit protocols iccp peer]
```

Description

Determine whether a peer is up or down by exchanging keepalive messages over the management link between the two Inter-Chassis Control Protocol (ICCP) peers.

When an ICCP connection is operationally down, the status of the peers hosting a multichassis link aggregation group (MC-LAG) is detected by sending liveness detection requests to each other. Peers must respond to liveness detection requests within a specified amount of time. If the responses are not received within that time for a given number of consecutive attempts, the liveness detection check fails, and a failure action is implemented. Backup liveness detection must be configured on both peers hosting the MC-LAG.

For more information on the ICCP failure scenarios and handling the failures, refer to ICCP Failure Scenarios for EX9200 Switches.

The remaining statement is explained separately. See CLI Explorer.

> **NOTE**: If backup liveness detection is configured, the peer status is always up when either the ICCP TCP Connection is established, or Bidirectional Forwarding Protocol (BFD) is configured and the peer is up. The backup liveness check is only performed when the ICCP connection is down.

> **NOTE**: When an MC-LAG node *(n0)* is rebooted with ICCP disabled on it, the backup liveness of the other node *(n1)* remains active even though the remote link goes down. This is because the status of the last action performed on the Backup Liveness process is shown in the CLI, the Backup Liveness process is not active on the other node *(n1)*, and therefore, the node *(n1)* is unable to read the current status of the first node *(n0)*. However, there is no traffic loss. The Backup Liveness process is not active all the time; it runs only when initiated.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

neighbor address],
[edit protocols l2circuit local-switching interface interface-name],
[edit protocols l2circuit neighbor address interface interface-name],
[edit routing-instances routing-instance-name protocols vpls neighbor address]
```

Description

Configure pseudowire redundancy for Layer 2 circuits and VPLS. A redundant pseudowire can act as a backup connection and can be configured between a PE router and a CE device or between PE routers, maintaining Layer 2 circuit and VPLS services after certain types of failures. This feature can help improve the reliability of certain types of networks where a single point of failure could interrupt service for customers.

NOTE: The `psn-tunnel-endpoint` statement is not supported at the `[edit protocols l2circuit local-switching interface interface-name end-interface interface interface-name]` hierarchy level.

Options

address—Specifies the address for the backup neighbor.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

routing—To view this statement in the configuration.

Description

Specify the IP address of the peer being used as a backup peer in the Bidirectional Forwarding Detection (BFD) configuration. You can specify any IP address in the default routing-instance. We recommend using the management IP addresses associated with `fxp0` or `em0` for redundancy in the event of a network disruption.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.2.

backup-remote-gateway

IN THIS SECTION

- Syntax | 2811
- Hierarchy Level | 2811
- Description | 2811
- Options | 2812
- Required Privilege Level | 2812
- Release Information | 2812

Syntax

```
backup-remote-gateway address;
```

Hierarchy Level

```
[edit services ipsec-vpn rule rule-name term term-name then]
```

Description

Define the backup remote address to which the IPsec traffic is directed when the primary remote gateway is down. Configuring this statement also enables the dead peer detection (DPD) protocol.

Options

address—Backup remote IPv4 or IPv6 address.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

backup-router

IN THIS SECTION

- Syntax | 2812
- Hierarchy Level | 2813
- Description | 2813
- Options | 2813
- Required Privilege Level | 2813
- Release Information | 2813

Syntax

```
backup-router address <destination destination-address>;
```

Hierarchy Level

```
[edit system]
```

Description

Set a default router (running IP version 4 [IPv4]) to use while the local router (running IPv4) is booting and if the routing protocol processes fail to start. The Junos OS removes the route to this router as soon as the software starts.

Options

address	Address of the default router.
destination ***destination-address***	(Optional) Destination address that is reachable through the backup router. You can include this option to achieve network reachability while loading, configuring, and recovering the router, but without the risk of installing a default route in the forwarding table.

- **Default:** All hosts (default route) are reachable through the backup router.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

[edit routing-instances instance-name routing-options],
[edit routing-options]
```

Description

Define backup selection policies, per prefix per primary next-hop interface, to enforce loop-free alternate (LFA) selection based on admin-group, srlg, bandwidth, protection-type, node, node-tag, and metric attributes of the backup path.

The remaining statements are explained separately. See CLI Explorer.

Options

destination *prefix*
Define the backup selection policy for a particular destination prefix or for all the prefixes. The *prefix* is the destination prefix name and prefix length. You can specify 0/0 for the IPv4 least-specific prefix or 0::0/0 for the IPv6 least-specific prefix.

interface
Define the backup selection policy for a specific primary next hop.

interface-name
Name of the primary next-hop interface.

all
All the interfaces.

bandwidth-greater-equal-primary
Allow the selection of the backup next hop only if the bandwidth is greater than or equal to the bandwidth of the primary next hop.

dest-metric (highest | lowest)
Specifiy the metric from the one-hop neighbor or from the remote router such as an RSVP backup label-switched-path (LSP) tail-end router to the final destination.

- **highest** Select the backup path that has the highest destination metric.

lowest Select the backup path that has the lowest destination metric.

downstream-paths-only Select the backup path that is a downstream path to the destination.

evaluation-order [admin-group srlg bandwidth protection-type neighbor neighbor-tag metric] Control the order and the criteria of evaluating the backup path. The default order of evaluation is admin-group, srlg, bandwidth, protection-type, neighbor, neighbor-tag, and metric.

> **NOTE**: For the explicitly configured evaluation order, only the listed attributes influence the selection of the backup path.

metric-order [root dest] Specify the order of preference of the root and the destination metric during the backup path selection. The preference order can be:

- `[root dest]` — Backup path selection or preference is first based on the root-metric criteria. If the criteria of all the root-metric is the same, then the selection or preference is based on the dest-metric.
- `[dest root]` — Backup path selection or preference is first based on the dest-metric criteria. If the criteria of all the dest-metric is the same, then the selection is based on the root-metric.

> **NOTE**: By default, backup paths with lower destination metric criteria are selected or preferred. If the criteria is the same, then the lowest root metric criteria is preferred or selected.

root The metric to a one-hop neighbor or a remote router.

dest The metric from a one-hop neighbor or remote router to the final destination.

protection-type (link | node | node-link) Specify the required protection type of the backup path.

> **NOTE**: If no protection-type is configured, then by default the first best path that matches all the other criteria is executed.

link Select the backup path that provides link protection.

node Select the backup path that provides node protection.

node-link Allow either node or link protection LFA where node-protection LFA is preferred over link-protection LFA.

root-metric (highest | lowest) Specify the metric to the one-hop neighbor or to the remote router such as an RSVP backup label-switched-path (LSP) tail-end router.

highest Select the highest root metric.

lowest Select the lowest root metric.

srlg (loose | strict) Define the backup selection to either allow or reject the common shared risk link groups (SRLGs) between the primary link and any link in the backup path.

loose Allow the backup path that has common srlgs between the primary link and any link in the backup path. A backup path with a fewer number of srlg collisions is preferred.

strict Reject the backup path that has common srlgs between the primary link and each link in the backup path.

node Define a list of loop-back IP addresses of the adjacent nodes to either prefer or exclude in the backup path selection. The node can be a local (adjacent router) node, remote node, or any other router in the backup path.

> **NOTE**: The nodes are identified through the TE-router-ID TLV advertised by a node in the LSP.

exclude [*node-address*] Specify the list of nodes to be excluded. The backup path that has a router from the list is not selected as the loop-free alternative or backup next hop.

node-address Name of one or more nodes to be excluded during backup path selection.

preference [*node-address*] Define an ordered set of nodes to be preferred. The backup path having the leftmost node is selected.

node-address Name of one or more nodes to be preferred in the backup path selection.

node-tag Define per-neighbor policy to either prefer or exclude a backup path.

> **NOTE**: This statement identifies a group of nodes in the network based on criteria such as the same neighbor tag values for all PE nodes. This is implemented using IS-IS admin-tags.

exclude [*node-address*]
: Specify the list of nodes to be excluded. The backup path that has a router from the list is not selected as the loop-free alternative or backup next hop.

  node-address
  : Name of one or more nodes to be excluded during backup path selection.

preference [*node-address*]
: Define an ordered set of nodes to be preferred. The backup path having the leftmost node is selected.

  node-address
  : Name of one or more nodes to be preferred in the backup path selection.

The remaining statements are explained separately. See CLI Explorer.

[edit logical-systems logical-system-name routing-instances routing-instance-name protocols
isis],
[edit protocols isis],
[edit routing-instances routing-instance-name protocols isis]
```

Description

Configure options for running the shortest-path-first (SPF) algorithm for backup next hops for protected interfaces. Use these options to override the default behavior of having Junos OS calculate backup paths for all the topologies in an instance when at least one interface is configured with link protection or node-link protection.

This configuration option is used in conjunction with the `node-link-protection` statement to compute per-prefix loop-free alternate routes (LFAs).

Options

node-link-degradation Degrade an interface from node-link to link protection in case no node protection LFA route is found for a given destination node.

per-prefix-calculation Calculate backup next hops for non-best prefix originators.

remote-backup-calculation Determine the remote LFA backup paths from the point of local repair (PLR) in an IS-IS network. For every protected link on the PLR, Junos OS creates a dynamic LDP label-switched path to reach the remote LFA node. When the primary link fails, the PLR uses these remote LFA backup paths to reach all the destinations reachable through the primary-link.

use-source-packet-routing Enable use of source packet routing node segment labels for computing backup paths for normal IPv4 or IPv6 IS-IS prefixes and primary IS-IS source packet routing node segments.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control-level—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.4R3.

`node-link-degradation` option added in Junos OS Release 14.2.

`use-source-packet-routing` option introduced in Junos OS Release 16.2R1 for MX Series and PTX Series routers.
Support for this option introduced in Junos OS Release 17.2R1 for QFX5100 and QFX10000 switches.

Support for `remote-backup-calculation` option introduced in Junos OS Release 18.2R1 for QFX5100, QFX5110, and QFX5200 switches.

[edit protocols ospf topology (default | name)],
[edit routing-instances routing-instance-name protocols (ospf | ospf3)],
[edit routing-instances routing-instance-name protocols ospf topology (default | name)]
```

Description

Configure options for running the shortest-path-first (SPF) algorithm for backup next hops for protected interfaces. Use these options to override the default behavior of having Junos OS calculate backup paths for all the topologies in an instance when at least one interface is configured with link protection or node-link protection. These options also enable you to change the default behavior for a specific topology in an OSPF instance.

Options

disable Do not calculate backup next hops for the specified instance or topology.

downstream-paths-only Calculate and install only downstream paths as defined in RFC 5286, *Basic Specification for IP Fast Reroute: Loop-Free Alternates* for the specified instance or topology.

no-install Do not install the backup next hops for the specified instance or topology.

node-link-degradation Degrade an interface from node-link to link protection in case no node protection LFA route is found for a given destination node. A link protecting loop-free alternate (LFA) is used when node-link protecting LFA is not available in the topology for any of the protected links.

per-prefix-calculation Calculate backup next hops for non-best prefix originators.

- `all`—Calculate per-prefix loop free alternate (LFA) for all.
- `externals`—Calculate per-prefix LFA for not-so-stubby and externals only.
- `stubs`—Calculate per-prefix LFA for stubs only.
- `summary`—Calculate per-prefix LFA for summary originators only.

remote-backup-calculation Determine the remote LFA backup paths from the point of local repair (PLR) in an OSPF network. For every protected link on the PLR, Junos OS creates a dynamic LDP label-switched path to reach the remote LFA node. When the primary link fails, the PLR uses these remote LFA backup paths to reach all the destinations reachable through the primary-link.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control-level—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.0.

`node-link-degradation`, `per-prefix-calculation`, and `remote-backup-calculation` options introduced in Junos OS Release 15.1.

Support for `remote-backup-calculation` option introduced in Junos OS Release 18.2R1 for QFX5100, QFX5110, and QFX5200 switches.

backward-frr-enable

IN THIS SECTION

- Syntax | 2828
- Hierarchy Level | 2828
- Description | 2828
- Default | 2828
- Options | 2828
- Required Privilege Level | 2829
- Release Information | 2829

Syntax

```
(backward-frr-enable | no-backward-frr-enable);
```

Hierarchy Level

```
[edit interfaces interface-name otn-options preemptive-fast-reroute]
```

Description

Enable or disable backward fast reroute status insertion.

Enable backward fast reroute to insert local pre-forward error correction (FEC) bit error rate (BER) status into transmitted OTN frames, notifying the remote interface. The remote interface can use the information to reroute traffic to a different interface. When you enable backward fast reroute and also enable pre-FEC BER monitoring including the `signal-degrade-monitor-enable` statement, notification of signal degradation and rerouting of traffic occurs in less time than that required through a Layer 3 protocol.

> **NOTE**: When you configure pre-FEC BER signal degrade monitoring, we recommend that you configure both the `signal-degrade-monitor-enable` and `backward-frr-enable` statements.

You can also configure the pre-FEC BER thresholds that raise or clear a signal degrade alarm and the time interval for the thresholds. If the BER thresholds and interval are not configured, the default values are used. Include the `ber-threshold-signal-degrade` *value*, `ber-threshold-clear` *value*, and `interval` *value* statements at the `[edit interfaces` *interface-name* `otn-options signal-degrade]` hierarchy level to configure the BER thresholds and time interval. See *Understanding Pre-FEC BER Monitoring and BER Thresholds* for more information about pre-FEC BER monitoring and determining BER threshold settings.

Default

By default, backward fast reroute insertion is disabled.

Options

`backward-frr-enable`—Enable backward fast reroute status insertion.

`no-backward-frr-enable`—Do not enable backward fast reroute status insertion.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2.

bandwidth (storm control)

IN THIS SECTION

- Syntax | 2833
- Hierarchy Level | 2834
- Description | 2834
- Default | 2834
- Options | 2834
- Required Privilege Level | 2835
- Release Information | 2835

Syntax

```
bandwidth bandwidth;
```

Hierarchy Level

```
[edit ethernet-switching-options storm-control interface (all |
interface-name)]
```

Description

Configure the storm control level as the bandwidth in kilobits per second of the applicable traffic streams, as follows:

- On EX2200, EX3200, EX3300, EX4200, and EX6200 switches—Applies to the combined broadcast and unknown unicast streams by default. Storm control does not apply to multicast traffic by default on these switches. If you enable storm control for multicast traffic on a specific interface, the configured bandwidth allocation applies to the combined broadcast, unknown unicast, and multicast traffic on that interface.
- On EX4500 and EX8200 switches—Applies to the combined broadcast, multicast, and unknown unicast streams.

> **NOTE**: When you configure storm control bandwidth on an aggregated Ethernet interface, the storm control level for each member of the aggregated Ethernet interface is set to that bandwidth. For example, if you configure a storm control bandwidth of 15,000 Kbps on **ae1**, and **ae1** has two members, **ge-0/0/0** and **ge-0/0/1**, each member has a storm control level of 15,000 Kbps. Thus, the storm control level on **ae1** allows a traffic rate of up to 30,000 Kbps of combined broadcast, multicast, and unknown unicast traffic.

Default

If you omit the `bandwidth` statement when you configure storm control on an interface, the storm control level defaults to 80 percent of the available bandwidth used by the combined applicable traffic streams. Depending upon the configuration, applicable traffic could include broadcast, unknown unicast, and multicast traffic.

Options

bandwidth—Traffic rate in kilobits per second of the combined applicable traffic streams.

- **Range:** 100 through 10,000,000
- **Default:** None

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.5.

```

Description

Specify a set of bandwidth threshold values and associated metric values for an OSPF interface or for a topology on an OSPF interface. When the bandwidth of an interface changes, Junos OS automatically sets the interface metric to the value associated with the appropriate bandwidth threshold value.

Options

bandwidth *value*—Specify the bandwidth threshold in bits per second.

- **Range:** 9600 through 1,000,000,000,000,000

metric *number*—Specify a metric value to associate with a specific bandwidth value.

- **Range:** 1 through 65,535

> **NOTE**: You must also configure a static metric value for the OSPF interface or topology with the `metric` statement. Junos OS uses this value to calculate the cost of a route from the OSPF interface or topology if the bandwidth for the interface is higher than of any bandwidth threshold values configured for bandwidth-based metrics.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.5.

```

Description

Specify a set of bandwidth threshold values and associated metric values for an IS-IS interface or a group of interfaces configured under IS-IS `interface-group`. Depending on the combined bandwidth of the member interfaces, IS-IS advertises the specified metric value for the interface. When the cumulative bandwidth of an interface group changes, Junos OS automatically sets the interface metric to the value associated with the appropriate bandwidth threshold value. We recommend a maximum of 3 sets of bandwidth threshold values and associated metric values for easy interface management.

NOTE: You must also configure a default static metric value for the interface or topology with the `bandwidth-based-metric` statement. Junos OS uses this value to calculate the cost of a route from the IS-IS interface or topology if the bandwidth for the interface is higher than any of the specified bandwidth threshold values. In case you have not configured the default static metric value IS-IS calculates the metric based on the reference-bandwidth.

Options

bandwidth *threshold* Specify the bandwidth threshold in bits per second.

- **Range:** 9600 through 1,000,000,000,000,000

metric ***metric metric***

Specify a metric value to associate with a specific bandwidth value.

- **Range:** 0 through 16,777,215

Required Privilege Level

routing—To view this statement in the configuration.

Release Information

Syntax

```
bandwidth packets-per-second;
```

Hierarchy Level

- For MX Series routers, T4000 routers, and EX9200 switches:

```
[edit system ddos-protection protocols protocol-group  (aggregate | packet-type)]
```

- For ACX Series routers, PTX Series routers and QFX Series switches:

```
[edit system ddos-protection protocols protocol-group  (aggregate | packet-type)]
```

Description

Configure the DDoS bandwidth rate limit; that is, the maximum traffic rate (packets per second) allowed by the specified policer. When the value is exceeded, a violation is declared.

Options

packets-per-second—Number of packets per second that are allowed by the aggregate or packet-type policer.

- **Range:** 1 through 100,000 packets per second
- **Default:** The default bandwidth value varies by packet type or protocol. You can view the default values for all packet types or protocols before you begin control plane DDoS protection configuration by entering the `show ddos-protection protocols parameters brief` command from operational mode. For ACX Series routers, PTX Series routers and QFX Series switches, the default bandwidth limits are also provided in "protocols (DDoS) (ACX Series, PTX Series, and QFX Series)" on page 13765.

Required Privilege Level

bandwidth-degradation

IN THIS SECTION

- Syntax | 2841
- Hierarchy Level | 2841
- Description | 2842
- Options | 2842
- Required Privilege Level | 2842
- Release Information | 2842

Syntax

```
bandwidth-degradation {
    action (log-only | restart | offline | restart-then-offline);
    no-fabric-switchover;
    percentage (1-99);
}
```

Hierarchy Level

```
[edit chassis fpc slot-numberfabric]
```

Description

Configure a FPC to take a specific action once bandwidth degradation reaches a certain percentage to avoid causing a null route in the chassis.

> **NOTE**: This configuration statement is mutually exclusive with the `offline-on-fabric-bandwidth-reduction` statement. If both statements are configured, the commit check fails and returns an error.

> **NOTE**: MX Series devices will count fabric planes in the `offline` or `fault` state as part of the bandwidth degradation percentage calculation. On PTX Series devices, when a fabric plane is offline it won't be counted in the bandwidth degradation percentage calculation.

Options

log-only	A message gets logged in the chassisd and message files when the fabric degradation threshold is reached. No other actions are taken.
restart	The FPC with a degraded fabric plane is restarted once the threshold is reached.
offline	The FPC with a degraded fabric plane is taken offline once the threshold is reached. The FPC requires manual intervention to be brought back online. This is the default action if no action attribute configured.
restart-then-offline	The FPC with a degraded fabric plane is restarted once the threshold is reached, and if fabric plane degradation is detected again within 10 minutes, the FPC is taken offline. The FPC requires manual intervention to be brought back online.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1.

[edit protocols mpls label-switched-path lsp-name fast-reroute],
[edit protocols mpls label-switched-path lsp-name (primary | secondary) path-name]
```

Description

When configuring an LSP, specify the traffic rate associated with the LSP.

When configuring fast reroute, allocate bandwidth for the reroute path. By default, no bandwidth is reserved for the rerouted path. The fast reroute bandwidth does not need to be identical to that allocated for the LSP itself.

When configuring a multiclass LSP, use the `ct`*number bandwidth* statements to specify the bandwidth to be allocated for each class type.

Options

bps—Bandwidth, in bits per second. You can specify this as an integer value. You can also use the abbreviations `k` (for a thousand), `m` (for a million), or `g` (for a billion).

- **Range:** Any positive integer
- **Default:** 0 (no bandwidth is reserved)

> **NOTE**: On the ACX Series, *bps* is the only supported option.

`ct`*number bps*—Bandwidth for the specified class type, in bits per second. You can specify this as an integer value. If you do so, count your zeros carefully, or you can use the abbreviations `k` (for a thousand), `m` (for a million), or `g` (for a billion [also called a thousand million]).

- **Range:** Any positive integer
- **Default:** 0 (no bandwidth is reserved)

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

bandwidth (Inline Services)

IN THIS SECTION

- Syntax | 2845
- Hierarchy Level | 2845
- Description | 2846
- Options | 2846
- Required Privilege Level | 2846
- Release Information | 2846

Syntax

```
bandwidth bandwidth-value;
```

Hierarchy Level

```
[edit chassis fpc slot-number pic number inline-services]
```

Description

Configure the amount of bandwidth in gigabits per second reserved on each Packet Forwarding Engine for tunnel traffic using inline services. Configuring the bandwidth creates a virtual tunnel interface that is represented as `si-<fpc/pic/port>`.

Starting in Junos OS Release 16.2, you are not longer required to explicitly specify a bandwidth for L2TP LNS tunnel traffic using inline services. When you do not specify a bandwidth, the maximum bandwidth supported on the PIC is automatically available for the inline services; inline services can use up to this maximum value. In earlier releases, you must specify a bandwidth when you enable inline services with the `inline-services` statement.

Options

bandwidth-value Amount of bandwidth in Gbps to reserve for tunnel traffic using inline services. You can configure bandwidth values can be as follows:

- `1g`
- `10g` through `100g` in 10 Gbps increments: `10g`, `20g`, `30g`, `40g`, `50g`, `60g`, `70g`, `80g`, `90g`, `100g`
- `100g` through `400g` in 100 Gbps increments: `100g`, `200g`, `300g`, `400g`

> **NOTE**: Values of 100 Gbps and up are available only on MPC7E, MPC8E, and MPC9E line cards.

- **Default:** Maximum bandwidth supported on the PIC.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.4.

`20g`, `30g`, and `40g` options added in Junos OS Release 14.1R3.

`100g` option added in Junos OS Release 18.2R1 on MX Series Routers with MPC7E, MPC8E, and MPC9E line cards.

`50g`, `60g`, `70g`, `80g`, `90g`, `200g`, `300g` and `400g` options added in Junos OS Release 18.3R1.

- Description | 2847
- Options | 2848
- Required Privilege Level | 2848
- Release Information | 2848

Syntax

```
bandwidth rate;
```

Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]
```

Description

Configure the bandwidth value for an interface. This statement is valid for all logical interface types except multilink and aggregated interfaces.

NOTE: We recommend that you be careful when setting this value. Any interface bandwidth value that you configure using the `bandwidth` statement affects how the interface cost is calculated for a dynamic routing protocol, such as OSPF. By default, the interface cost for a dynamic routing protocol is calculated using the following formula:

```
cost = reference-bandwidth/bandwidth,
```

where bandwidth is the physical interface speed. However, if you specify a value for bandwidth using the `bandwidth` statement, that value is used to calculate the interface cost, rather than the actual physical interface bandwidth.

Options

rate—Peak rate, in bits per second (bps) or cells per second (cps). You can specify a value in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation `k` (1000), `m` (1,000,000), or `g` (1,000,000,000). You can also specify a value in cells per second by entering a decimal number followed by the abbreviation `c`; values expressed in cells per second are converted to bits per second by means of the formula 1 cps = 384 bps.

- **Range:** Not limited.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Syntax

```
bandwidth-level kbps;
```

Hierarchy Level

```
[edit forwarding-options storm-control-profiles profile-name all]
```

Description

Configure the storm control level as the bandwidth in kilobits per second of the available bandwidth used by the combined broadcast, multicast, and unknown unicast traffic streams.

> **NOTE**: When you configure storm control level on an aggregated Ethernet interface, the storm control level for each member of the aggregated Ethernet interface is set to that bandwidth. For example, if you configure a storm control level of 15,000 Kbps on ae1, and ae1 has two members, ge-0/0/0 and ge-0/0/1, each member has a storm control level of 15,000 Kbps. Thus, the storm control level on ae1 allows a traffic rate of up to 30,000 Kbps of combined broadcast, multicast, and unknown unicast traffic.

Default

On EX4300 switches—If you do not specify the storm control level using either the `bandwidth-level` or the `bandwidth-percentage` statements, the storm control level defaults to 80 percent of the available bandwidth used by the combined broadcast, unknown unicast, and multicast traffic streams.

On EX9200 switches—Storm control is not enabled by default.

On MX Series routers—Storm control is not enabled by default.

Options

`bandwidth-level` *kbps*—Traffic rate in kilobits per second of the combined broadcast, multicast, and unknown unicast traffic streams.

- **Range:** 100 through 10,000,000

- **Range:** 100 through 100,000,000 on QFX10000 Series switches
- **Default:** None

[edit dynamic-profiles profile-name firewall policer policer-name if-exceeding],
[edit firewall policer policer-name if-exceeding],
[edit logical-systems logical-system-name policer policer-name if-exceeding]
```

Description

For a single-rate two-color policer, configure the bandwidth limit as a number of bits per second. Single-rate two-color policing uses the single token bucket algorithm to measure traffic-flow conformance to a two-color policer rate limit.

Traffic at the interface that conforms to the bandwidth limit is categorized green. Traffic that exceeds the specified rate is also categorized as green provided that sufficient tokens remain in the single token bucket. Packets in a green flow are implicitly marked with `low` packet loss priority (PLP) and then passed through the interface.

Traffic that exceeds the specified rate when insufficient tokens remain in the single token bucket is categorized red. Depending on the configuration of the two-color policer, packets in a red traffic flow might be implicitly discarded; or the packets might be re-marked with a specified forwarding class, a specified PLP, or both, and then passed through the interface.

> **NOTE**: This statement specifies the bandwidth limit as an absolute number of bits per second. Alternatively, for single-rate two-color policers only, you can use the `bandwidth-percent` *percentage* statement to specify the bandwidth limit as a percentage of either the physical interface port speed or the configured logical interface shaping rate.

Single-rate two-color policing allows bursts of traffic for short periods, whereas single-rate and two-rate three-color policing allows more sustained bursts of traffic.

Hierarchical policing is a form of two-color policing that applies different policing actions based on whether the packets are classified for expedited forwarding (EF) or for a lower priority. You apply a hierarchical policer to ingress Layer 2 traffic to allows bursts of EF traffic for short period and bursts of non-EF traffic for short periods, with EF traffic always taking precedence over non-EF traffic.

Options

bps—You can specify the number of bits per second either as a decimal number or as a decimal number followed by the abbreviation `k` (1000), `m` (1,000,000), or `g` (1,000,000,000).

```

Description

Configure the bandwidth model for differentiated services. Note that you cannot configure both bandwidth models at the same time.

Options

`extended-mam`—The extended maximum allocation model (MAM) is a bandwidth model based on MAM.

`mam`—The MAM is defined in RFC 4125, *Maximum Allocation Bandwidth Constraints Model for Diffserv-aware MPLS Traffic Engineering*.

`rdm`—The Russian dolls bandwidth allocation model (RDM) is defined in RFC 4127, *Russian Dolls Bandwidth Constraints Model for Diffserv-aware MPLS Traffic Engineering*. RDM makes efficient use of bandwidth by allowing the class types to share bandwidth.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

- Syntax | 2863
- Hierarchy Level | 2863
- Description | 2863
- Options | 2864
- Required Privilege Level | 2864
- Release Information | 2864

Syntax

`bandwidth` *`bandwidth`*;

Hierarchy Level

`[edit chassis fpc` *`slot`*`]`

Description

Configure the MPC bandwidth.

By default, MPC8E provides a maximum bandwidth of 960 Gbps. You can upgrade MPC8E to provide an increased bandwidth of 1600 Gbps (1.6 Tbps) by using an add-on license. After you purchase the license and configure the `bandwidth 1.6T` statement, MPC8E provides an increased bandwidth of 1.6 Tbps. After you upgrade the MPC, you can use the `show chassis fpc` *`slot`* `detail` command to verify the status as shown in the following example:

```
[edit]
user@router# run show chassis fpc 3 detail
Slot 3 information:
  State                                   Online
  Temperature                          29
  Total CPU DRAM                     3200 MB
...
```

```
  Max Power Consumption            1150 Watts
  Configured Bandwidth            1600 G
  Operating Bandwidth             1600 G

[edit]
user@router#
```

Options

bandwidth Configure the MPC to operate at a specified bandwidth. You can specify `1.6T` as the value to configure the MPC to operate at a bandwidth of 1.6 Tbps.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.1.

[edit dynamic-profiles profile-name firewall policer policer-name if-exceeding],
[edit firewall policer policer-name if-exceeding],
[edit logical-systems logical-system-name policer policer-name if-exceeding]
```

Description

For a single-rate two-color policer, configure the bandwidth limit as a percentage value. Single-rate two-color policing uses the *single token bucket algorithm* to measure traffic-flow conformance to a two-color policer rate limit.

Traffic at the interface that conforms to the bandwidth limit is categorized green. Traffic that exceeds the specified rate is also categorized as green provided that sufficient tokens remain in the single token bucket. Packets in a green flow are implicitly marked with `low` packet loss priority and then passed through the interface.

Traffic that exceeds the specified rate when insufficient tokens remain in the single token bucket is categorized red. Depending on the configuration of the two-color policer, packets in a red traffic flow might be implicitly discarded; or the packets might be re-marked with a specified forwarding class, a specified PLP, or both, and then passed through the interface.

> **NOTE**: This statement specifies the bandwidth limit as a percentage of either the physical interface port speed or the configured logical interface shaping rate. Alternatively, you can use the `bandwidth-limit` *`bps`* statement to specify the bandwidth limit as an absolute number of bits per second.

The function of the bandwidth limit is extended by the burst size (configured using the `burst-size-limit` *`bytes`* statement) to allow bursts of traffic up to a limit based on the overall traffic load:

- When a single-rate two-color policer is applied to the input or output traffic at an interface, the initial capacity for traffic bursting is equal to the number of bytes specified by this statement.
- During periods of relatively low traffic (traffic that arrives at or departs from the interface at overall rates below the token arrival rate), unused tokens accumulate in the bucket, but only up to the configured token bucket depth.

Single-rate two-color policing allows bursts of traffic for short periods, whereas single-rate and two-rate three-color policing allows more sustained bursts of traffic.

Hierarchical policing is a form of two-color policing that applies different policing actions based on whether the packets are classified for expedited forwarding (EF) or for a lower priority. You apply a hierarchical policer to ingress Layer 2 traffic to allows bursts of EF traffic for short period and bursts of non-EF traffic for short periods, with EF traffic always taking precedence over non-EF traffic.

Options

`percentage`—Traffic rate as a percentage of either the physical interface media rate or the logical interface configured shaping rate. You can configure a shaping rate on a logical interface by using class-of-service statement.

> **NOTE**: The bandwidth percentage policer cannot be used to rate-limit tunnel or software interfaces, or for forwarding table filters. It is only valid for interface-specific filters. When used for matching bandwidth or burst-size on aggregated Ethernet or SONET bundles, bandwidth percentage policers must be used in conjunction with `shared-bandwidth-policer`.

- **Range:** 0 through 100
- **Default:** None.

bandwidth-percentage

IN THIS SECTION

- Syntax | 2869
- Hierarchy Level | 2869
- Description | 2869
- Default | 2870
- Required Privilege Level | 2870
- Release Information | 2870

Syntax

```
bandwidth-percentage percentage;
```

Hierarchy Level

```
[edit forwarding-options storm-control-profiles profile-name all]
```

Description

Configure the storm control level as the percentage of total interface bandwidth used by the combined broadcast, multicast, and unknown unicast traffic streams on an interface. The storm control level is configured as part of the storm control profile. As an example, a 10 Gbps interface with a 10% storm-control bandwidth configuration provides 1Gbps limit on BUM (broadcast, unknown, and multicast) traffic. So rate of BUM traffic can be up to 1Gbps and if the rate exceeds, the BUM packets are dropped.

NOTE: When you configure storm control level on an aggregated Ethernet interface, the storm control level for each member of the aggregated Ethernet interface is set to that bandwidth. For example, if you configure a storm control level of 15,000 Kbps on ae1,

and ae1 has two members, ge-0/0/0 and ge-0/0/1, each member has a storm control level of 15,000 Kbps. Thus, the storm control level on ae1 allows a traffic rate of up to 30,000 Kbps of combined broadcast, multicast, and unknown unicast traffic.

Default

On EX4300 switches—The storm control level is 80 percent of the available bandwidth used by the combined broadcast, unknown unicast, and multicast traffic streams.

On EX9200 switches—Storm control is not enabled by default.

On MX Series routers—Storm control is not enabled by default.

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Description

For certain logical interfaces (such as Asynchronous Transfer Mode [ATM], Permanent Virtual Circuit [PVC], or Frame Relay), you cannot determine the correct bandwidth from the hardware. This statement enables you to specify the actual available bandwidth.

This statement also enables you to specify the bandwidth for a bypass label switched path (LSP). If you have configured multiple bypasses, this statement is mandatory and is applied to all of the bypass LSPs.

Default

The hardware raw bandwidth is used.

Options

bps—Bandwidth in bits per second. You can specify this as an integer value. If you do so, count your zeros carefully, or you can use the abbreviations `k` (for a thousand), `m` (for a million), or `g` (for a billion [also called a thousand million]).

- **Range:** Any positive integer
- **Default:** 0 (no bandwidth is reserved)

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

```
[edit chassis fpc slot-number pic number tunnel-services]
```

```
[edit chassis fpc slot-number pfe pfe-id core core-id channel channel-id tunnel-services]
```

```
[edit chassis feb slot slot-number pfe pfe-id core core-id channel channel-id tunnel-services]
```

Description

(ACX Series, MX Series 5G Universal Routing Platforms and T4000 Core Routers only) Configure the amount of bandwidth in gigabits per second reserved on each Packet Forwarding Engine for tunnel traffic using tunnel services. Configuring the bandwidth creates a virtual tunnel interface that is represented as *interface-<fpc/pic/port>*. Refer to Tunnel Services Overview for a list of interfaces that support tunneling services.

Options

bandwidth-value—Amount of bandwidth in Gbps to reserve for tunnel traffic using tunnel services:

- On ACX Series routers, the bandwidth values can be `1g` or `10g`.
- On ACX7K Series routers (ACX7100-32C, ACX7100-48L, ACX7332, ACX7348, ACX7509, ACX7024, and ACX7024X) the bandwidth values can be as follows:
- - `1g`
  - `10g` through `100g` in 10 Gbps increments: `10g`, `20g`, `30g`, `40g`, `50g`, `60g`, `70g`, `80g`, `90g`, `100g`
  - `100g` through `400g` in 100 Gbps increments: `100g`, `200g`, `300g`, `400g`
- On MX Series routers, the bandwidth values can be as follows:
  - `1g`
  - `10g` through `100g` in 10 Gbps increments: `10g`, `20g`, `30g`, `40g`, `50g`, `60g`, `70g`, `80g`, `90g`, `100g`
  - `100g` through `400g` in 100 Gbps increments: `100g`, `200g`, `300g`, `400g`
- On T4000 routers, the bandwidth values can be `10g` through `100g` in 10 Gbps increments: `10g`, `20g`, `30g`, `40g`, `50g`, `60g`, `70g`, `80g`, `90g`, `100g`.

> **NOTE**: The bandwidth that you specify determines the port number of the tunnel interfaces that are created. When you specify a bandwidth of `1g`, the port number is always 10. When you specify any other bandwidth, the port number is always 0.

> **NOTE**: If you specify a bandwidth that is not compatible with the type of DPCs or MPCs and their respective Packet Forwarding Engine, tunnel services are not activated. For example, you cannot specify 1 gigabit per second bandwidth for a Packet Forwarding Engine on a 10-Gigabit Ethernet 4-port DPC or 16x10GE 3D MPC.
>
> When the tunnel bandwidth is unspecified in the Routing Engine CLI, the maximum tunnel bandwidth for MPC3E is 60G.

batch query

IN THIS SECTION

- Syntax | 2887
- Hierarchy Level | 2887
- Description | 2887
- Options | 2888
- Required Privilege Level | 2888
- Release Information | 2889

Syntax

```
batch-query {
    items-per-batch items-per-batch;
    query-interval seconds;
}
```

Hierarchy Level

```
[edit services user-identification identity-management]
```

Description

Configure the SRX Series Firewall to communicate with the Juniper Identity Management Service server to obtain an access token to use to query the server for identity information for an individual user (IP query and user query) or a group of users (batch query). The access token allows the SRX Series Firewall to connect to the Juniper Identity Management Service server to query it for this information.

The batch-query statement allows the SRX Series Firewall to periodically query the Juniper Identity Management Service server automatically for user identity information. When you start the SRX Series Firewall, it automatically sends a batch query request to the Juniper Identity Management Service server to obtain all of the user identity information that it expects. After it receives the user identity information, the SRX Series Firewall periodically issues a query to the Juniper Identity Management Service server requesting that a new report be generated to include any newly available user identity items so as to keep its authentication table entries up-to-date.

You can configure an interval for when the batch query request is to be issued and the maximum number of user identity items to be sent in response to the query in one batch. Only remaining available user identity items are sent if their number is fewer than the configured maximum.

NOTE: If you need to refresh the user identities in the authentication table—that is, everything that was received automatically when you started the system and from subsequent batch queries or IP queries—you can clear the authentication table by disabling the user-identification feature configuration. Afterward, you can reconfigure the advanced-query feature to retrieve all available user identities. To accomplish this, you use the following sequence of CLI statements: deactivate services user-identification, commit, activate services user-identification, commit.

WARNING: Before you use this feature, you must disable active-directory-access and authentication-source options under the [edit services user-identification] hierarchy. You cannot commit this configuration if active directory authentication or the ClearPass query and webapi functions are configured and committed.

The advanced query feature queries the Juniper Identity Management Service for user identification information that the SRX Series stores in its authentication table and uses to authenticate users. Use of the Juniper Identity Management Service allows you to provision users locally and have their authentication information made available to other sites in your network for policy enforcement and reporting.

To obtain device information, such as device identity, groups, and the operating system, from the Juniper Identity Management Service server using either the batch-query or ip-query configuration, you must set the device authentication source, as follows.

```
user@host# set services user-identification device-information authentication-source network-
access-controller
```

Options

items-per-batch The maximum number of user identity items that the SRX Series Firewall will accept in one batch in response to the query.

- **Default:** `200`
- **Range:** `100-1000`

query-interval. Interval in seconds after which the SRX Series Firewall will issue a query request for newly generated user identities.

- **Default:** `5`
- **Range:** `1-60`

Required Privilege Level

bb-sc-n

IN THIS SECTION

- Syntax | **2889**
- Hierarchy Level | **2889**
- Description | **2890**
- Options | **2890**
- Required Privilege Level | **2890**
- Release Information | **2890**

Syntax

```
bb-sc-n bb-sc-n;
```

Hierarchy Level

```
[edit interfaces interface-name                fibrechannel-options]
```

Description

Configure the buffer-to-buffer credit state change number to prevent the permanent loss of Fibre Channel credits over time (buffer-to-buffer credit recovery).

Options

bb-sc-n—Number of buffer-to-buffer state change credits.

- **Range:** 0 through 15
- **Default:** 0 (disabled)

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.1.

beacon-period

IN THIS SECTION

- Syntax | **2891**
- Hierarchy Level | **2891**

- Description | 2891
- Options | 2892
- Required Privilege Level | 2892
- Release Information | 2892

Syntax

```
beacon-period milliseconds;
```

Hierarchy Level

Original CLI

```
[edit ethernet-switching options secure-access-port vlan (all | vlan-name) examine-fip examine-
vn2vn]
```

ELS CLI for Platforms that Support FCoE

```
[edit vlans vlan-name forwarding-options fip-security]
```

NOTE: The `beacon-period` configuration statement is in a different hierarchy on the original CLI than on the Enhanced Layer 2 Software (ELS) CLI.

Description

Set the interval between periodic beacons. Beacons perform virtual link maintenance for VN_Ports in a way that is similar to FIP keepalive advertisements.

The ENode sends periodic beacons every 90 seconds on behalf of the VN_Port. Each received beacon resets the session timer for the virtual link connection to the other VN_Port. If the FCF does not receive a beacon before the beacon timer expires, the VN_Port is considered as “down” and the virtual link is terminated. The beacon timer expires in 2.5 times the configured beacon timer value.

Options

milliseconds—Time in milliseconds between beacons.

- **Range:** 250 through 90000 milliseconds
- **Default:** 8000 milliseconds

Required Privilege Level

storage—To view this statement in the configuration.
storage-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.2.

Statement introduced for the ELS CLI in Junos OS Release 13.2 for the QFX Series.

bearer-type (L2TP Tunnel Switching)

IN THIS SECTION

- Syntax | 2893
- Hierarchy Level | 2893
- Description | 2893
- Options | 2893
- Required Privilege Level | 2893

Release Information | 2894

Syntax

```
bearer-type action;
```

Hierarchy Level

```
[edit access tunnel-switch-profile profile-name avp]
```

Description

Specify the action taken on the Bearer Type AVP (18) in the L2TP packets during tunnel switching if the AVP is negotiated when the first session is created.

Options

action—One of the following actions:

- `drop`—Drop the AVP.
- `regenerate`—Regenerate the AVP based on the local policy at the LTS and send it in the switched packet. The local policy may or may not use the value for the AVP received during negotiation for the first session.
- `relay`—Forward the AVP transparently as is and send it in the switched packet.
- **Default:** `relay`

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2.

RELATED DOCUMENTATION

L2TP Tunnel Switching For Multiple-Domain Networks

ber-threshold-clear

IN THIS SECTION

- Syntax | 2894
- Hierarchy Level | 2894
- Description | 2894
- Options | 2896
- Required Privilege Level | 2896
- Release Information | 2897

Syntax

```
ber-threshold-clear value;
```

Hierarchy Level

```
[edit interfaces interface-name otn-options signal-degrade]
[edit interfaces interface-name otn-options odu-signal-degrade]
```

Description

Specify bit error rate (BER) threshold to clear the interface alarm for signal degradation.

You can configure the BER clear threshold to customize the BER that will clear an interface alarm when signal degrade monitoring is enabled.

> **NOTE**: Configuring a high BER threshold for signal degradation and a long interval might cause the internal counter register to be saturated. Such a configuration is ignored by the router, and the default values are used instead. A system log message is logged for this error.

If you configure the BER thresholds at the [`edit interfaces` *`interface-name`* `otn-options signal-degrade`] hierarchy level, then the thresholds are calculated using the pre-forward error correction (pre-FEC) BER (the BER before FEC correction). These thresholds are used for pre-FEC BER monitoring. See *Understanding Pre-FEC BER Monitoring and BER Thresholds* for more information about pre-FEC BER monitoring and determining BER threshold settings.

If you configure the BER thresholds at the [`edit interfaces` *`interface-name`* `otn-options odu-signal-degrade`] hierarchy level, then the thresholds are calculated using the post-FEC BER (the BER after FEC correction). This BER is referred to as the optical channel data unit (ODU) BER.

> **NOTE**: You can configure ODU BER thresholds only at the [`edit interfaces` *`interface-name`* `otn-options odu-signal-degrade`] hierarchy level on the P2-100GE-OTN PIC.

Table 5 on page 2895 shows the default values for pre-FEC BER and ODU BER signal degrade threshold values for different PICs. If the BER signal degrade threshold is not configured, the default value is used.

Table 5: Default Clear Threshold Values

PIC or MPC	Default Pre-FEC BER Clear Threshold Value	Default ODU BER Clear Threshold Value
P1-PTX-2-100G-WDM	3.0E–3	Not supported
P2-100GE-OTN	3.0E–3	1.0E–9
P1-PTX-24-10G-W-SFPP	3.0E–3	Not supported
MIC6-100G-CFP2	1.0E-6	1.0E-9
MPC5E	1.0E-6	1.0E-9

To configure the threshold that raises the signal degrade alarm, include the `ber-threshold-signal-degrade` statement at the same hierarchy level. To configure the time interval during which the BER must stay above or below the configured thresholds to raise or clear the alarm, include the `interval` statement at the same hierarchy level.

> **NOTE**: For the P1-PTX-2-100G-WDM PIC, the BER must stay above the signal degradation threshold for ten consecutive intervals for the alarm to be raised and the BER must stay below the clear threshold for ten consecutive intervals for the alarm to be cleared. For example, if the interval is configured as 10 ms, then the BER must stay above the signal degradation threshold for 100 ms (10 ms * 10 intervals) for the alarm to be raised, or below the clear threshold for 100 ms for the alarm to be cleared.

Options

- **Values:** *value*—BER threshold for clearing the signal degradation in scientific notation. Both the mantissa and exponent are configurable. Enter the value in the format *x*E-*n*, where *x* is the mantissa and *n* is the exponent. For example, 4.5E-3.
- **Range:** The mantissa must be a decimal number. There is no limit on the number of digits before or after the decimal point.

  The exponent must be an integer from 0 through 9.
- **Default:** See Table 5 on page 2895 for the default values.

> **BEST PRACTICE**: Always set the `ber-threshold-clear` *value* lower than the `ber-threshold-signal-degrade` *value*. For the FEC limits, see the table describing the signal degrade and clear thresholds after configuration in *Understanding Pre-FEC BER Monitoring and BER Thresholds*.

> **NOTE**: In Junos OS Release 13.2R1, only the exponent is valid input for the BER threshold value, and the mantissa is not configurable. The BER threshold value is 1.0E−*n* where *n* > 0, and the valid range of *n* is from 1 through 10.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2.

Configuring OTN Interfaces on P1-PTX-2-100G-WDM

ber-threshold-signal-degrade

IN THIS SECTION

- Syntax | 2897
- Hierarchy Level | 2897
- Description | 2898
- Options | 2899
- Required Privilege Level | 2900
- Release Information | 2900

Syntax

```
ber-threshold-signal-degrade value;
```

Hierarchy Level

```
[edit interfaces interface-name otn-options signal-degrade]
[edit interfaces interface-name otn-options odu-signal-degrade]
```

Description

Specify the bit error rate (BER) threshold to raise an interface alarm for signal degradation.

You can configure the BER signal degrade threshold to customize the BER that will raise an interface alarm when signal degrade monitoring is enabled.

> **NOTE**: Configuring a high BER threshold for signal degradation and a long interval might cause the internal bit error counter register to get saturated. For example, for the P1-PTX-2-100G-WDM PIC, the internal bit error counter gets saturated when the error count reaches 2E+29. Therefore, the value of ber-threshold-signal-degrade * line rate / interval must be less than 2E+29 to avoid saturation. Assuming a fixed PIC line rate of 1.27E+11 bits per second and an interval of 1000 ms, the `ber-threshold-signal-degrade` value must be less than 4.22E−3.
>
> If the value of the ber-threshold-signal-degrade * line rate / interval exceeds the saturation limit, the configuration is ignored by the router, and the default values are used instead. A system log message is logged for this error.

If you configure the BER thresholds at the [`edit interfaces` *`interface-name`* `otn-options signal-degrade`] hierarchy level, then the thresholds are calculated using the pre-forward error correction (pre-FEC) BER (the BER before FEC correction). These thresholds are used for pre-FEC BER monitoring. See *Understanding Pre-FEC BER Monitoring and BER Thresholds* for more information about pre-FEC BER monitoring and determining BER threshold settings.

If you configure the BER thresholds at the [`edit interfaces` *`interface-name`* `otn-options odu-signal-degrade`] hierarchy level, then the thresholds are calculated using the post-FEC BER (the BER after FEC correction). This BER is referred to as the optical channel data unit (ODU) BER.

> **NOTE**: You can configure ODU BER thresholds only at the [`edit interfaces` *`interface-name`* `otn-options odu-signal-degrade`] hierarchy level on the P2-100GE-OTN PIC.

Table 6 on page 2898 shows the default values for pre-FEC BER and ODU BER signal degrade threshold values for different PICs. If the BER signal degrade threshold is not configured, the default value is used.

Table 6: Default Signal Degrade Threshold Values

PIC or MPC	Default Pre-FEC BER Signal Degrade Threshold Value	Default ODU BER Signal Degrade Threshold Value
P1-PTX-2-100G-WDM	7.5E−3	Not supported

Table 6: Default Signal Degrade Threshold Values *(Continued)*

PIC or MPC	Default Pre-FEC BER Signal Degrade Threshold Value	Default ODU BER Signal Degrade Threshold Value
P2-100GE-OTN	7.5E−3	1.0E−6
P1-PTX-24-10G-W-SFPP	7.5E−3	Not supported
MIC6-100G-CFP2	1.14E-5	1.0E-06
MPC5E	1.14E-5	1.0E-06

To configure the threshold that clears the signal degrade alarm, include the `ber-threshold-clear` statement at the same hierarchy level. To configure the time interval during which the BER must stay above or below the configured thresholds to raise or clear the alarm, include the `interval` statement at the same hierarchy level.

> **NOTE**: For the P1-PTX-2-100G-WDM PIC, the BER must stay above the signal degradation threshold for ten consecutive intervals for the alarm to be raised and the BER must stay below the clear threshold for ten consecutive intervals for the alarm to be cleared. For example, if the interval is configured as 10 ms, then the BER must stay above the signal degradation threshold for 100 ms (10 ms * 10 intervals) for the alarm to be raised, or below the clear threshold for 100 ms for the alarm to be cleared.

Options

value—BER threshold for signal degradation in scientific notation. Both the mantissa and exponent are configurable. Enter the value in the format *x*E−*n*, where *x* is the mantissa and *n* is the exponent. For example, 4.5E−3.

- **Range:** The mantissa must be a decimal number. There is no limit on the number of digits before or after the decimal point.

  The exponent must be an integer from 0 through 9.

- **Default:** See Table 6 on page 2898.

NOTE: In Junos OS Release 13.2R1, only the exponent is valid input for the BER threshold value, the mantissa is not configurable. The BER threshold value is 1.0E–*n* where *n* > 0, and the valid range of *n* is from 1 through 10.

BEST PRACTICE: To enable proactive protection before packet loss occurs, set the `ber-threshold-signal-degrade` *value* below the FEC limit. For the FEC limits, see the table describing the signal degrade and clear thresholds after configuration in *Understanding Pre-FEC BER Monitoring and BER Thresholds*.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

- Options | **2901**

Required Privilege Level | 2903
Release Information | 2903

Syntax

```
bert-algorithm algorithm;
```

Hierarchy Level

```
[edit interfaces ce1-fpc/pic/port],
[edit interfaces ct1-fpc/pic/port],
[edit interfaces interface-name ds0-options],
[edit interfaces interface-name e1-options],
[edit interfaces interface-name e3-options],
[edit interfaces interface-name t1-options],
[edit interfaces interface-name t3-options]
```

Description

Configure the pattern to send in the bit stream during a bit error rate test (BERT). Applies to T1, E3, T3, and multichannel DS3 interfaces, the channelized interfaces (DS3, OC12, STM1), and channelized IQ and IQE interfaces (E1, E3 and DS3).

NOTE: When configuring CE1 or CT1 interfaces on 10-port Channelized E1/T1 IQE PICs, the `bert-algorithm` statement must be included at the `[edit interfaces ce1-fpc/pic/port]` or `[edit interfaces ct1-fpc/pic/port]` hierarchy level as appropriate.

Options

algorithm—Pattern to send in the bit stream. There are two categories of test patterns: pseudorandom and repetitive. Both patterns conform to CCITT/ITU O.151, O.152, O.153, and O.161 standards. The algorithm can be one of the following patterns:

- `all-ones-repeating`—Pattern is all ones.

- `all-zeros-repeating`—Pattern is all zeros.
- `alternating-double-ones-zeros`—Pattern is alternating pairs of ones and zeros.
- `alternating-ones-zeros`—Pattern is alternating ones and zeros.
- `pseudo-2e3`—Pattern is $2^3 - 1$.
- `pseudo-2e4`—Pattern is $2^4 - 1$.
- `pseudo-2e5`—Pattern is $2^5 - 1$.
- `pseudo-2e6`—Pattern is $2^6 - 1$.
- `pseudo-2e7`—Pattern is $2^7 - 1$.
- `pseudo-2e9-o153`—Pattern is $2^9 - 1$, as defined in the O153 standard.
- `pseudo-2e10`—Pattern is $2^{10} - 1$.
- `pseudo-2e11-o152`—Pattern is $2^{11} - 1$, as defined in the O152 standard.
- `pseudo-2e15-o151`—Pattern is $2^{15} - 1$, as defined in the O151 standard.
- `pseudo-2e17`—Pattern is $2^{17} - 1$.
- `pseudo-2e18`—Pattern is $2^{18} - 1$.
- `pseudo-2e20-o151`—Pattern is $2^{20} - 1$, as defined in the O151 standard.
- `pseudo-2e20-o153`—Pattern is $2^{20} - 1$, as defined in the O153 standard.
- `pseudo-2e21`—Pattern is $2^{21} - 1$.
- `pseudo-2e22`—Pattern is $2^{22} - 1$.
- `pseudo-2e23-o151`—Pattern is $2^{23} - 1$, as defined in the O151 standard.
- `pseudo-2e25`—Pattern is $2^{25} - 1$.
- `pseudo-2e28`—Pattern is $2^{28} - 1$.
- `pseudo-2e29`—Pattern is $2^{29} - 1$.
- `pseudo-2e31`—Pattern is $2^{31} - 1$.
- `pseudo-2e32`—Pattern is $2^{32} - 1$.
- `repeating-1-in-4`—One bit in four is set to 1; the others are set to 0.

- `repeating-1-in-8`—One bit in eight is set to 1; the others are set to 0.
- `repeating-3-in-24`—Three bits in twenty four are set to 1; the others are set to 0.
- **Default:** `pseudo-2e3`

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Description

Configure the duration of a BERT test. Applies to E1, E3, T1, and T3 interfaces, and to E1, E3, T1, and T3 partitions on the channelized interfaces (CE1, CT1, DS3, OC3, OC12, OC48, STM1, STM4, and STM16).

E1 and T1 IQ, IQE, and standard interfaces support an extended BERT period range, up to 86,400 seconds (24 hours).

NOTE: When configuring CE1 or CT1 interfaces on 10-port Channelized E1/T1 IQE PICs, the `bert-period` statement must be included at the `[edit interfaces ce1-fpc/pic/port]` or `[edit interfaces ct1-fpc/pic/port]` hierarchy level as appropriate.

Options

seconds—Test duration. Range and default values vary by interface type.

Range:

- - PIC-dependent—Normal BERT period: either 1 through 239 seconds or 1 through 240 seconds
  - PIC-dependent—Extended BERT period: from 1 through 86,400 seconds

Default:

- - Normal BERT period: 10 seconds
  - Extended BERT period (on supported E1 interfaces): 10 seconds
  - Extended BERT period (on supported T1 interfaces): 240 seconds

Required Privilege Level

```

Description

Configure trace options for Bidirectional Forwarding Protocol (BFD) traffic. Configure seamless BFD (S-BFD) over non-colored static segment-routing LSPs with first-hop label resolution and use S-BFD as a fast mechanism to detect path failures and to trigger global convergence.

Default

If you do not include this statement, no BFD tracing operations are performed.

Options

disable—(Optional) Disable the BFD tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as **all**.

file ***filename***—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks. All files are placed in the **/var/log** directory . We recommend that you place global routing protocol tracing output in the **routing-log** file.

files ***number***—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**, then ***trace-file*.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

- **Range:** 2 through 1000 files
- **Default:** 2 files

flag ***flag***—Tracing operation to perform. To specify more than one tracing operation, include multiple `flag` statements. These are the BFD protocol tracing options:

- **adjacency**—Trace adjacency messages.
- **all**—Trace all options for BFD.
- **error**—Trace all errors.
- **event**—Trace all events.
- **issu**—Trace in-service software upgrade (ISSU) packet activity.

- **nsr-packet**—Trace non-stop-routing (NSR) packet activity.
- **nsr-synchronization**—Trace NSR synchronization events.
- **packet**—Trace all packets.
- **pipe**—Trace pipe messages.
- **pipe-detail**—Trace pipe messages in detail.
- **ppm-packet**—Trace packet activity by periodic packet management (PPM).
- **state**—Trace state transitions.
- **timer**—Trace timer processing.

match ***regular-expression***—(Optional) Regular expression for lines to be logged.

no-world-readable—(Optional) Prevent any user from reading the log file.

size ***size***—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file*.0**. When the trace file again reaches its maximum size, ***trace-file*.0** is renamed ***trace-file*.1** and ***trace-file*** is renamed ***trace-file*.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

- **Syntax:** ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB
- **Range:** 10 KB through the maximum file size supported on your system
- **Default:** 128 KB

world-readable—(Optional) Allow any user to read the log file.

sbfd—Seamless BFD parameters. In S-BFD, each responder might have multiple discriminators. The discriminators might be advertised by IGP to other routers, or they might be statically configured on these routers.

local-discriminator ***value***—Local discriminator for seamless BFD responder.

Range: 1 through 4294967295.

- **local-ip-address** ***IP address***—IPv4 source address.
- **minimum-receive-interval** ***value***—Minimum receive interval for seamless BFD responder.

  Range: 10 through 255000 milliseconds.

local-discriminator-ip ***IP address***—Local discriminator IP address for sBFD responder.

pool ***value***—List of seamless BFD endpoints.

   }
threshold value;
```

Hierarchy Level

```
[edit chassis high-availability services-redundancy-group name monitor],
[edit chassis high-availability services-redundancy-group name monitor monitor-object name]
```

Description

Configure Bidirectional Forwarding Detection (BFD) monitoring to detect failures in a network. You can configure Multinode High Availability to monitor one or more links using BFD. This configuration

triggers a failover in the event of BFD failure. Configure BFD liveliness by specifying source and destination IP and the interface where the peer device is directly connected to.

Options

<dst-ip> Destination IPV4/IPV6 address for BFD monitoring

interface *interface*— Name of the interface for single-hop sessions

routing-instance *routing-instance*— Routing instance to locate the route

session-type— BFD Monitoring session type. Configure BFD session mode to be single-hop or multihop. By default, BGP uses single-hop BFD sessions if the peer is directly connected to the router's interface.

src-ip *src-ip*— Source IPV4/IPV6 address for BFD monitoring

weight *number* (monitor-object) — BFD monitoring weight value for SRG monitoring object.

- **Range:** 1 through 1000

threshold (monitor-object) —BFD-liveliness monitoring threshold value.

- **Range:** 1 through 1000

Within a monitor-object, whenever the particular object fails to trigger a failover as result of BFD monitoring, the system considers the event as monitoring failure and adds a count to BFD-liveliness.

When the count exceeds the threshold value BFD-liveliness, the system adds the count to parent monitoring-object's threshold value. Monitoring-object's threshold also includes threshold values of interface monitoring and IP monitoring.

When the sum of the weights of all monitor objects bound to the SRG reaches a value equal to or greater than the threshold value configured on the SRG, the system triggers a monitor failure for that SRG. SRG fails over to the other node.

Required Privilege Level

Description

Configure bidirectional failure detection (BFD) timers and authentication for BGP.

For IBGP and multihop EBGP support, configure the `bfd-liveness-detection` statement at the global `[edit bgp protocols]` hierarchy level. You can also configure IBGP and multihop support for a routing instance or a logical system.

Options

holddown-interval *milliseconds*

(Optional) Configure an interval specifying how long a BFD session must remain up before a state change notification is sent.

When you configure the hold-down interval for the BFD protocol for EBGP, the BFD session is unaware of the BGP session during this time. In this case, if the BGP session goes down during the configured hold-down interval, BFD already assumes the BGP session is down and does not send a state change notification. The `holddown-interval` statement is supported only for EBGP peers at the `[edit protocols bgp group group-name neighbor address]` hierarchy level. If the BFD session goes down and then comes back up during the configured hold-down interval, the timer is restarted. You must configure the hold-down interval on both EBGP peers. If you configure the hold-down interval for a multihop EBGP session, you must also configure a local IP address by including the `local-address` statement at the `[edit protocols bgp group group-name]` hierarchy level.

- **Range:** 0 through 255,000 milliseconds
- **Default:** 0

minimum-interval *milliseconds*

(Required) Configure the minimum interval at which the local routing device transmits hello packets and then expects to receive a reply from a neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can specify the minimum transmit and receive intervals separately using the minimum-interval (specified under the `transmit-interval` statement) and minimum-receive-interval statements.

- **Range:** 1 through 255,000 milliseconds

minimum-receive-interval *milliseconds*

(Optional) Configure the minimum interval after which the local routing device must receive a reply from a neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can configure the minimum receive interval using the `minimum-interval` statement.

- **Range:** 1 through 255,000 milliseconds

multiplier *number*

(Optional) Configure the number of hello packets not received by a neighbor that causes the originating interface to be declared down.

- **Range:** 1 through 255
- **Default:** 3

no-adaptation

(Optional) Configure BFD sessions not to adapt to changing network conditions. We recommend that you *do not* disable BFD adaptation unless it is preferable to have BFD adaptation disabled in your network.

The BFD failure detection timers are adaptive and can be adjusted to be faster or slower. The lower the BFD failure detection timer value, the faster the failure detection and vice versa. For example, the timers can adapt to a higher value if the adjacency fails (that is, the timer detects failures more slowly). Or a neighbor can negotiate a higher value for a timer than the configured value. The timers adapt to a higher value when a BFD session flap occurs more than three times in a span of 15 seconds. A back-off algorithm increases the receive (Rx) interval by two if the local BFD instance is the reason for the session flap. The transmission (Tx) interval is increased by two if the remote BFD instance is the reason for the session flap. However, include the `no-adaptation` statement in the configuration if you do not want BFD sessions to adapt to changing network conditions.

You can use the `clear bfd adaptation` command to return BFD interval timers to their configured values. The `clear bfd adaptation` command does not affect traffic flow on the routing device.

- **Default:** BFD sessions adapt to changing network conditions.

session-mode (automatic | multihop | single-hop)

(Optional) Configure BFD session mode to be single-hop or multihop. By default, BGP uses single-hop BFD sessions if the peer is directly connected to the router's interface. BGP uses multihop BFD sessions if the peer is not directly connected to the router's interface. If the peer session's `local-address` option is configured, the directly connected check is based partly on the source address that would be used for BGP and BFD.

For backward compatibility, you can override the default behavior by configuring the `single-hop` or `multihop` option. Before Junos OS Release 11.1, the behavior was to assume that IBGP peer sessions were multihop.

- **Values:** Specify one of these values:
  - automatic—Configure BGP to use single-hop BFD sessions if the peer is directly connected to the router's interface, and multihop BFD sessions if the peer is not directly connected to the router's interface.
  - multihop—Configure BGP to use multihop BFD sessions.
  - single-hop—Configure BGP to use single-hop BFD sessions.
- **Default:** automatic

version (1 | automatic)

(Optional) Specify the BFD version.

- **Values:** Specify one of the following:
  - 1—Configure BFD version 1.
  - automatic—Configure the device to automatically detect the BFD version.
- **Default:** The device automatically detects the BFD version.

The remaining statements are explained separately. See CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.1.

`detection-time threshold` and `transmit-interval threshold` options introduced in Junos OS Release 8.2.

Support for logical routers introduced in Junos OS Release 8.3.

Support for IBGP and multihop EBGP sessions introduced in Junos OS Release 8.3.

`holddown-interval` option introduced in Junos OS Release 8.5. You can configure this option only for EBGP peers at the `[edit protocols bgp group` *`group-name`* `neighbor` *`address`*`]` hierarchy level.

`no-adaptation` option introduced in Junos OS Release 9.0.

Support for BFD authentication introduced in Junos OS Release 9.6.

`session-mode` option introduced in Junos OS Release 11.1.

Support for BFD on IPv6 interfaces with BGP introduced in Junos OS Release 11.2.

bfd-liveness-detection (EVPN Node Detection)

IN THIS SECTION

- Syntax | **2923**
- Hierarchy Level | **2924**
- Description | **2924**
- Options | **2924**
- Required Privilege Level | **2925**

Syntax

```
bfd-liveness-detection {
 no-adaptation;
 detection-time {
  threshold milliseconds;
 }
 inline-disable;
```

```
    minimum-interval milliseconds;
    minimum-receive-interval milliseconds;
    multiplier multiplier;
    neighbor neighbor;
    pdu-size pdu-size;
    transmit-interval {
     minimum-interval milliseconds;
     threshold milliseconds;
    }
    version(0 | 1 | automatic);
   }
```

Hierarchy Level

```
[edit logical-systems name protocols evpn node-detection],
[edit protocols evpn node-detection]
```

Description

Configure Bidirectional Forwarding Detection (BFD) timers and options for EVPN node detection.

Options

no-adaptation Disable the BFD adaptation. Include this statement to prevent the BFD sessions from adapting to changing network conditions.

detection-time Mandatory

- threshold *milliseconds* — Configure a threshold for the adaptation of the BFD session detection time. When the detection time equals or exceeds the threshold, a single trap and a single system log message are sent.
  - **Range:** 1 through 255000

inline-disable Disable inline mode for this BFD session

minimum-interval *milliseconds* Configure the minimum transmit and receive interval the local device transmits to, and expects a reply from, the BFD neighbor. Optionally, you can specify the minimum receive interval separately using the `minimum-receive-interval` option. Or you can use the `transmit-interval` statement's `minimum-interval` and `minimum-receive-interval` options.

- **Range:** 1 through 255000

minimum-receive-interval *milliseconds*

Configure the minimum interval the local device expects to receive a reply from the BFD neighbor. Optionally, instead of using this statement, you can configure the minimum receive interval using the `minimum-interval` statement.

- **Range:** 1 through 255000

multiplier *number*

Configure the number of BFD packets not received before declaring the BFD peer interface down.

- **Default:** 3
- **Range:** 1 through 255

neighbor

Configure the interface address of the BFD neighbor.

pdu-size

Configure the BFD transport protocol payload size

- **Default:** 24
- **Range:** 24 through 9000

transmit-interval

- minimum-interval *milliseconds* — Configure a minimum interval after which the local routing device transmits hello packets to a neighbor. Optionally, instead of using this statement, you can configure the minimum transmit interval using the minimum-interval statement.
  - **Range:** 1 through 255000
- threshold *milliseconds* — Configure the threshold for the adaptation of the BFD session transmit interval. When the transmit interval adapts to a value greater than the threshold, a single trap and a single system message are sent. The interval threshold must be greater than the minimum transmit interval.

version

BFD protocol version number

- 0—BFD version 0 (deprecated)
- 1—BFD version 1
- automatic—Choose BFD version automatically

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

}
```

Hierarchy Level

```
[edit interfaces name aggregated-ether-options],
[edit dynamic-profiles name interfaces name aggregated-ether-options],
[edit dynamic-profiles name logical-systems name interfaces name aggregated-ether-options]
```

Description

Configure Bidirectional Forwarding Detection (BFD) timers and authentication for aggregated Ethernet interfaces.

For an aggregated ethernet interface, you cannot configure all three configuration options, `bfd-liveness-detection`, `minimum-links`, and `sync-reset` at the same time.

Options

holddown-interval *milliseconds*

Specify a time limit, in milliseconds, indicating the time that a BFD session remains up before a state change notification is sent. If the BFD session goes down and then comes back up during the hold-down interval, the timer is restarted.

- **Range:** 0 through 255,000
- **Default:** 0

local-address *bfd-local-address*

Specify the loopback address or the AE interface address of the source of the BFD session.

> **NOTE**: Beginning with Release 16.1R2, Junos OS checks and validates the configured micro BFD `local-address` against the interface or loopback IP address before the configuration commit. Junos OS performs this check on both IPv4 and IPv6 micro BFD address configurations, and if they do not match, the commit fails. The configured micro-BFD `local-address` should match with the micro-BFD `neighbour-address` configured on the peer router.

minimum-interval *milliseconds*

Specify a minimum time interval after which the local routing device transmits a BFD packet and then expects to receive a reply from the BFD neighbor. Optionally, instead of using this statement, you can configure the minimum transmit and receive intervals separately using the `transmit-interval minimum-interval` statement.

- **Range:** 1 through 255,000

minimum-receive-interval *milliseconds*

Specify the minimum time interval after which the routing device expects to receive a reply from the BFD neighbor.

- **Range:** 1 through 255,000

multiplier *number*

Specify the number of BFD packets that were not received by the BFD neighbor before the originating interface is declared down.

- **Range:** 1 through 255

neighbor *bfd-neighbor-address*

Specify the loopback address or the AE interface address of a remote destination to send BFD packets.

no-adaptation

Disable the BFD adaptation. Include this statement if you do not want the BFD sessions to adapt to changing network conditions. We recommend that you do not disable BFD adaptation unless it is preferable not to have BFD adaptation enabled in your network.

version

Configure the BFD version to detect (BFD version 1) or autodetect (the BFD version).

> **NOTE**: The `version` option is not supported on the QFX Series. Starting in Junos OS Release 17.2R1, a warning will appear if you attempt to use this command.

- **Default:** automatic

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.3.

```

Description

Configure bidirectional failure detection timers.

The BFD failure detection timers are adaptive and can be adjusted to be more or less aggressive. For example, the timers can adapt to a higher value if the adjacency fails, or a neighbor can negotiate a higher value for a timer than the configured value. The timers adapt to a higher value when a BFD session flap occurs more than three times in a span of 15 seconds. A back-off algorithm increases the receive (Rx) interval by two if the local BFD instance is the reason for the session flap. The transmission

(Tx) interval is increased by two if the remote BFD instance is the reason for the session flap. You can use the `clear bfd adaptation` command to return BFD interval timers to their configured values. The `clear bfd adaptation` command is hitless, meaning that the command does not affect traffic flow on the routing device.

The remaining statements are explained separately. See CLI Explorer.

```

Description

Configure bidirectional failure detection timers and authentication.

> **NOTE**: Starting with Junos OS Release 16.1, you can configure IS-IS BFD sessions for the IPv6 address family. Therefore, this configuration statement is also available under the `[edit protocols isis interface interface-name family inet|inet6]` hierarchy level.

The BFD failure detection timers are adaptive and can be adjusted to be faster or slower. For example, the timers can adapt to a higher value if the adjacency fails, or a neighbor can negotiate a higher value for a timer than the configured value. The timers adapt to a higher value when a BFD session flap occurs more than three times in a span of 15 seconds. A back-off algorithm increases the receive (RX) interval by two if the local BFD instance is the reason for the session flap. The transmission (TX) interval is increased by two if the remote BFD instance is the reason for the session flap.

You can use the `clear bfd adaptation` command to return BFD interval timers to their configured values. The `clear bfd adaptation` command does not affect traffic flow on the routing device.

Options

`authentication algorithm` *`algorithm-name`* —Configure the algorithm used to authenticate the specified BFD session: `simple-password`, `keyed-md5`, `keyed-sha-1`, `meticulous-keyed-md5`, `meticulous-keyed-sha-1`.

`authentication key-chain` *`key-chain-name`*—Associate a security key with the specified BFD session using the name of the security keychain. The name you specify must match one of the keychains configured in the `authentication-key-chains key-chain` statement at the `[edit security]` hierarchy level.

`authentication loose-check`—(Optional) Configure loose authentication checking on the BFD session. Use only for transitional periods when authentication might not be configured at both ends of the BFD session.

`detection-time threshold` *`milliseconds`*—Configure a threshold for the adaptation of the BFD session detection time. When the detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent.

`minimum-interval` *`milliseconds`*—Configure the minimum interval after which the local routing device transmits a hello packet and then expects to receive a reply from the neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can specify the minimum transmit and receive intervals separately using the `transmit-interval minimum-interval` and `minimum-receive-interval` statements.

- **Range:** 1 through 255,000

`minimum-receive-interval` *`milliseconds`*—Configure the minimum interval after which the local routing device expects to receive a reply from a neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can configure the minimum receive interval using the `minimum-interval` statement.

- **Range:** 1 through 255,000

`multiplier` *`number`*—Configure the number of hello packets not received by a neighbor that causes the originating interface to be declared down.

- **Range:** 1 through 255
- **Default:** 3

`no-adaptation`—Specify that BFD sessions not adapt to changing network conditions. We recommend that you not disable BFD adaptation unless it is preferable not to have BFD adaptation enabled in your network.

`transmit-interval threshold` *`milliseconds`*—Configure the threshold for the adaptation of the BFD session transmit interval. When the transmit interval adapts to a value greater than the threshold, a single trap and a single system message are sent. The interval threshold must be greater than the minimum transmit interval.

- **Range:** 0 through 4,294,967,295 (2^{32} – 1)

`transmit-interval minimum-interval` *`milliseconds`*—Configure a minimum interval after which the local routing device transmits hello packets to a neighbor. Optionally, instead of using this statement, you can configure the minimum transmit interval using the `minimum-interval` statement.

- **Range:** 1 through 255,000

`version`—Configure the BFD version to detect: `1` (BFD version 1) or `automatic` (autodetect the BFD version)

- **Default:** `automatic`

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

`detection-time threshold` and `transmit-interval threshold` options added in Junos OS Release 8.2.

Support for logical systems introduced in Junos OS Release 8.3.

`no-adaptation` statement introduced in Junos OS Release 9.0.

`authentication algorithm`, `authentication key-chain`, and `authentication loose-check` options introduced in Junos OS Release 9.6.

Description

Configure bidirectional failure detection timers and authentication for OSPF.

The remaining statements are explained separately. See CLI Explorer.

Options

`authentication algorithm` *`algorithm-name`* —Configure the algorithm used to authenticate the specified BFD session: `simple-password`, `keyed-md5`, `keyed-sha-1`, `meticulous-keyed-md5`, or `meticulous-keyed-sha-1`.

`authentication key-chain` *`key-chain-name`*—Associate a security key with the specified BFD session using the name of the security keychain. The name you specify must match one of the keychains configured in the `authentication-key-chains key-chain` statement at the `[edit security]` hierarchy level.

`authentication loose-check`—(Optional) Configure loose authentication checking on the BFD session. Use only for transitional periods when authentication may not be configured at both ends of the BFD session.

`detection-time threshold` *`milliseconds`*—Configure a threshold for the adaptation of the BFD session detection time. When the detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent.

`full-neighbors-only`—Establish BFD sessions only for OSPF neighbors in the full state. The default behavior is to establish BFD sessions for all OSPF neighbors.

`holddown-interval` *`holddown-interval`*—Time to hold the session-UP notification to the client.

- **Range:** 0 through 255000 milliseconds

`minimum-interval` *`milliseconds`*—Configure the minimum interval after which the local routing device transmits a hello packet and then expects to receive a reply from the neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can configure the minimum transmit and receive intervals separately using the `transmit-interval minimum-interval` and `minimum-receive-interval` statements.

- **Range:** 1 through 255,000 milliseconds

`minimum-receive-interval` *`milliseconds`*—Configure the minimum interval after which the routing device expects to receive a reply from a neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can configure the minimum receive interval using the `minimum-interval` statement.

- **Range:** 1 through 255,000 milliseconds

`multiplier` *`number`*—Configure the number of hello packets not received by a neighbor that causes the originating interface to be declared down.

- **Range:** 1 through 255
- **Default:** 3

`no-adaptation`—Specify that BFD sessions should not adapt to changing network conditions. We recommend that you not disable BFD adaptation unless it is preferable not to have BFD adaptation enabled in your network.

`pdu-size`—Adjust the size of BFD protocol data units (PDUs).

- **Range:** 24 through 9000 bytes
- **Default:** 24

`transmit-interval threshold` *`milliseconds`*—Configure the threshold for the adaptation of the BFD session transmit interval. When the transmit interval adapts to a value greater than the threshold, a single trap and a single system message are sent. The interval threshold must be greater than the minimum transmit interval.

- **Range:** 0 through 4,294,967,295 (2^{32} – 1)

`transmit-interval minimum-interval` *`milliseconds`*—Configure the minimum interval at which the routing device transmits hello packets to a neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can configure the minimum transmit interval using the `minimum-interval` statement.

- **Range:** 1 through 255,000

`version`—Configure the BFD version to detect: `1` (BFD version 1) or `automatic` (autodetect the BFD version).

- **Default:** `automatic`

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

`detection-time threshold` and `transmit-interval threshold` options added in Junos OS Release 8.2.

Support for logical systems introduced in Junos OS Release 8.3.

`no-adaptation` option introduced in Junos OS Release 9.0.

`no-adaptation` option introduced in Junos OS Release 9.0 for EX Series switches.

Options

`authentication algorithm` *`algorithm-name`* —Configure the algorithm used to authenticate the specified BFD session: `simple-password`, `keyed-md5`, `keyed-sha-1`, `meticulous-keyed-md5`, or `meticulous-keyed-sha-1`.

`authentication key-chain` *`key-chain-name`*—Associate a security key with the specified BFD session using the name of the security keychain. The name you specify must match one of the keychains configured in the `authentication-key-chains key-chain` statement at the `[edit security]` hierarchy level.

`authentication loose-check`—(Optional) Configure loose authentication checking on the BFD session. Use only for transitional periods when authentication is not configured at both ends of the BFD session.

`detection-time threshold` *`milliseconds`*—Configure a threshold for the adaptation of the BFD session detection time. When the detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent.

`minimum-interval` *`milliseconds`*—Configure the minimum interval after which the local routing device transmits a hello packet and then expects to receive a reply from the neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can specify the minimum transmit and receive intervals separately using the `transmit-interval minimum-interval` and `minimum-receive-interval` statements.

- **Range:** 1 through 255,000 milliseconds

`minimum-receive-interval` *`milliseconds`*—Configure the minimum interval after which the local routing device expects to receive a reply from a neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can configure the minimum receive interval using the `minimum-interval` statement.

- **Range:** 1 through 255,000 milliseconds

`multiplier` *`number`*—Configure the number of hello packets not received by a neighbor that causes the originating interface to be declared down.

- **Range:** 1 through 255
- **Default:** 3

`no-adaptation`—Configure BFD sessions not to adapt to changing network conditions. We recommend that you not disable BFD adaptation unless it is preferable not to have BFD adaptation enabled in your network.

`transmit-interval threshold` *`milliseconds`*—Configure the threshold for the adaptation of the BFD session transmit interval. When the transmit interval adapts to a value greater than the threshold, a single trap and a single system message are sent. The interval threshold must be greater than the minimum transmit interval.

- **Range:** 0 through 4,294,967,295 (2^{32} – 1)

`transmit-interval minimum-interval` *`milliseconds`*—Configure a minimum interval after which the local routing device transmits hello packets to a neighbor. Optionally, instead of using this statement, you can configure the minimum transmit interval using the `minimum-interval` statement.

- **Range:** 1 through 255,000

`version`—Configure the BFD version to detect: `1` (BFD version 1) or `automatic` (autodetect the BFD version).

- **Default:** `automatic`

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Description

Configure bidirectional failure detection timers and authentication criteria for static routes.

Options

authentication algorithm *algorithm-name* —Configure the algorithm used to authenticate the specified BFD session: **simple-password**, **keyed-md5**, **keyed-sha-1**, **meticulous-keyed-md5**, or **meticulous-keyed-sha-1**.

authentication key-chain *key-chain-name*—Associate a security key with the specified BFD session using the name of the security keychain. The name you specify must match one of the keychains configured in the `authentication-key-chains key-chain` statement at the `[edit security]` hierarchy level.

authentication loose-check—(Optional) Configure loose authentication checking on the BFD session. Use only for transitional periods when authentication may not be configured at both ends of the BFD session.

detection-time threshold *milliseconds*—Configure a threshold for the adaptation of the BFD session detection time. When the detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent.

echo—(Optional) Enable BFD `echo` mode. This feature sends BFD echo packets back and forth from a neighboring device to ensure that a forwarding path is available. BFD `echo` mode only works if the neighboring device supports BFD.

echo-lite—(Optional) Enable BFD `echo-lite` mode. This feature performs the same function as BFD `echo` mode but it works even if the neighboring device does not support BFD.

holddown-interval *milliseconds*—Configure an interval specifying how long a BFD session must remain up before a state change notification is sent. If the BFD session goes down and then comes back up during the hold-down interval, the timer is restarted.

- **Range:** 0 through 255,000
- **Default:** 0

local-address ***ip-address***—Enable a multihop BFD session and configure the source address for the BFD session.

minimum-interval ***milliseconds***—Configure the minimum interval after which the local routing device transmits a hello packet and then expects to receive a reply from the neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can configure the minimum transmit and receive intervals separately using the **transmit-interval minimum-interval** and `minimum-receive-interval` statements.

- **Range:** 1 through 255,000

minimum-receive-interval ***milliseconds***—Configure the minimum interval after which the routing device expects to receive a reply from a neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can configure the minimum receive interval using the `minimum-interval` statement at the `[edit routing-options static route` *`destination-prefix`* `bfd-liveness-detection]` hierarchy level.

- **Range:** 1 through 255,000

minimum-receive-ttl ***number***—Configure the time to live (TTL) for the multihop BFD session.

- **Range:** 1 through 255
- **Default:** 255

multiplier ***number***—Configure number of hello packets not received by the neighbor that causes the originating interface to be declared down.

- **Range:** 1 through 255
- **Default:** 3

neighbor ***address***—Configure a next-hop address for the BFD session for a next hop specified as an interface name.

no-adaptation—Specify for BFD sessions not to adapt to changing network conditions. We recommend that you not disable BFD adaptation unless it is preferable not to have BFD adaptation enabled in your network.

transmit-interval threshold ***milliseconds***—Configure the threshold for the adaptation of the BFD session transmit interval. When the transmit interval adapts to a value greater than the threshold, a single trap and a single system message are sent. The interval threshold must be greater than the minimum transmit interval.

- **Range:** 0 through 4,294,967,295

transmit-interval minimum-interval ***milliseconds***—Configure the minimum interval at which the routing device transmits hello packets to a neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can configure the minimum transmit interval using the `minimum-`

`interval` statement at the `[edit routing-options static route destination-prefix bfd-liveness-detection]` hierarchy level.

- **Range:** 1 through 255,000

version—Configure the BFD version to detect: **1** (BFD version 1) or **automatic** (autodetect the BFD version).

- **Default: automatic**

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

detection-time threshold and **transmit-interval threshold** options introduced in Junos OS Release 8.2.

`local-address` statement introduced in Junos OS Release 8.2.

`minimum-receive-ttl` statement introduced in Junos OS Release 8.2.

Support for logical routers introduced in Junos OS Release 8.3.

`holddown-interval` statement introduced in Junos OS Release 8.5.

`no-adaptation` statement introduced in Junos OS Release 9.0.

Support for IPv6 static routes introduced in Junos OS Release 9.1.

authentication algorithm, **authentication key-chain**, and `authentication loose-check` statements introduced in Junos OS Release 9.6.

`echo` and `echo-lite` statements introduced in Junos OS Release 22.4R1.

bfd-liveness-detection (Source Packet Routing Template)

IN THIS SECTION

- Syntax | 2955
- Hierarchy Level | 2955
- Description | 2955
- Options | 2956
- Required Privilege Level | 2956
- Release Information | 2956

Syntax

```
bfd-liveness-detection {
    minimum-interval milliseconds;
    multiplier multiplier;
    no-router-alert-option;
    sbfd;
}
```

Hierarchy Level

```
[edit protocols source-packet-routing source-routing-path-template]
```

Description

Configure Bidirectional forwarding detection (BFD) options for PCE-initiated segment routing LSP template.

NOTE: The BFD configuration is applied at the top level and not individually per segment list. As a result, each path of the PCE-initiated LSP inherits the same BFD configuration.

Options

minimum-interval Specify in milliseconds the minimum transmit and receive interval.

- **Range:** 1 through 255000 milliseconds

multiplier Specify the detection time multiplier.

- **Default:** 3
- **Range:** 1 through 255

no-router-alert-option Do not set the router alert option in the IP header.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

routing

Release Information

Statement introduced in Junos OS Release 19.4R1.

Configuring BGP Neighbor Discovery Through RPM

bgp-error-tolerance (Protocols BGP)

IN THIS SECTION

- Syntax | 2960
- Hierarchy Level | 2960
- Description | 2960
- Options | 2960

Required Privilege Level | 2961
Release Information | 2961

Syntax

```
bgp-error-tolerance {
    (malformed-route-limit number | no-malformed-route-limit);
    malformed-update-log-interval seconds;
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols bgp],
[edit logical-systems logical-system-name protocols bgp group group-name],
[edit logical-systems logical-system-name protocols bgp group group-name neighbor address],
[edit protocols bgp],
[edit protocols bgp group group-name],
[edit protocols bgp group group-name neighbor address]
```

Description

Enable error handling for BGP update messages.

Starting in Junos OS Release 24.2R1, BGP error handling is enabled by default. You can still configure sub-options such as, `malformed-route-limit`, `malformed-update-log-interval`, and `no-malformed-route-limit` under this configuration statement. Note that If you delete the `bgp-error-tolerance` statement, the feature will still remain enabled and the sub-options are reset to their default values.

Options

malformed-route-limit *number*

Configure a limit on the number of malformed hidden routes stored in memory.

> **NOTE**: When the value of `malformed-route-limit` is reduced, only new malformed BGP update messages are affected and the existing malformed routes are retained.

- **Default:** 1000
- **Range:** 0 through 4294967295

malformed-update-log-interval *seconds*

Configure the duration for which the logging of malformed BGP update messages are suppressed.

On configuring the malformed update log interval:

1. The first malformed BGP update message is logged.
2. All subsequent malformed update messages are suppressed until the log interval expires.
3. On log interval expiry, the total number of malformed attributes received during the interval are logged.

This process repeats when the next malformed update message is received.

- **Default:** 300 seconds
- **Range:** 10 through 65535 seconds

no-malformed-route-limit

Disable the limit on the number of malformed hidden routes stored in memory.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2.

            }
        }
    }
```

Hierarchy Level

```
[edit protocols]
```

Description

Enable Bit Index Explicit Replication (BIER) on the routing device.

You must include the `bier` statement in the configuration to enable BIER on the router.

Options

sub-domain Assign a numeric value to the sub-domain. It represents a specific topology within a BIER domain.

- **Range:** 0 through 255.

bfr-id A BFR-ID is a number assigned to an ingress or egress BFR. A BFR-ID must be unique within that BIER sub-domain.

- **Range:** 1 through 1024.

bfr-prefix A BFR prefix is typically the configured loopback address of a BFR and must be a routable IP address in the BIER domain. Mandatory.

encapsulation Specify encapsulation type.

- mpls—Currently Junos only supports MPLS encapsulation.

bitstringlen Configure bit string length.

- Currently Junos only supports a bit string length of 256.

number-sets Specify the number of BIER sets.

- **Default:** 4
- **Range:** 1 through 4

Default

BIER is disabled on the routing device.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos Evolved OS Release 23.4R2-S1.

bier-sub-domain (Protocols IS-IS)

IN THIS SECTION

- Syntax | 2974
- Hierarchy Level | 2975
- Description | 2975
- Options | 2975

```

Description

Specify an SRv6 prefix that defines a micro SID block. Configure micro SID block parameters such as global and local micro SIDs. In segment routing domain, a global micro SID. identifies a shortest-path to a node. A local micro SID identifies a cross connect to a direct neighbor over a specific interface.

name Specify a block name.

address Specify a block prefix IPv6 address for segment routing. Default block-length is 32 bits, block-length of 32 only is allowed on the ACX Series.

global-micro-sid (Optional) Specify the size of global micro SIDs.Global SIDs are static by default. Configure the global micro SID block range parameters such as the micro SID length. The length of a micro SID is 16 by default.

- maximum-sids : Specify the maximum number of SIDs used for global block
  - Range: 0 through 65536
  - Default: 57343
- maximum-static-sids: Specify the maximum number of static SIDs used for a global block (0..65536). Note that currently we do not support dynamic global micro SIDS.
  - Range: 0 through 65536
  - Default: If you do not configure the maximum static SIDs, then maximum-sids value is used.

local-micro-sid (Optional) the local micro SID block range parameters.

- maximum-static-sids: Specify the size of the local micro SID block.
- Default: 0

The remaining statements are explained separately. See CLI Explorer.

block-allocation (Source NAT Next Gen Services)

IN THIS SECTION

- Syntax | 2983
- Hierarchy Level | 2983
- Description | 2983
- Options | 2984
- Required Privilege Level | 2984
- Release Information | 2984

Syntax

```
block-allocation {
    active-block-timeout timeout-interval;
    block-size block-size;
    interim-logging-interval timeout-interval;
    maximum-blocks-per-host maximum-block-number
    log disable | enable
}
```

Hierarchy Level

```
[edit services nat source pool nat-pool-name port]
```

Description

Allocate a block of ports for each subscriber to use for source NAT with port translation, except for deterministic NAT. New requests for NAT ports for the subscriber are served from the active block.

With port block allocation, we generate one syslog log per set of ports allocated for a subscriber. This reduces the number of logs, making it easier to track subscribers.

Options

active-block-timeout *timeout-interval*

The interval, in seconds, for which the block is active. After the timeout, a new block is allocated, even if ports are available in the active block. If you set the timeout to 0, port blocks are filled completely before a new port block is allocated, and the last port block remains active indefinitely.

- **Range:** 0 through 86,400
- **Default:** 0

block-size *block-size*

Number of ports in a block.

- **Range:** 1 through 64,512
- **Default:** 128

interim-logging-interval *timeout-interval*

The interval, in seconds, at which to send interim system logs for active port blocks and for inactive port blocks with live sessions. This increases the reliability of system logs, which are UDP-based and can get lost in the network.

- **Range:** 1800 through 86,400
- **Default:** 0 (interim logs are disabled)

maximum-blocks-per-host *maximum-block-number*

The maximum number of blocks that can be allocated to a subscriber address.

- **Range:** 1 through 512
- **Default:** 8

log disable

Disable logs for port block allocation. Logs are enbled by default.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 19.3R2.

block-command

IN THIS SECTION

- Syntax | 2985
- Hierarchy Level | 2985
- Description | 2985
- Required Privilege Level | 2985
- Release Information | 2985

Syntax

```
block-command protocol-command-list;
```

Hierarchy Level

```
[edit security utm default-configuration]
[edit security utm feature-profile content-filtering profile profile-name]
```

Description

Apply protocol block command custom-objects to the content-filtering profile.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.5.

The `[edit security utm default-configuration]` hierarchy level is introduced in Junos OS Release 18.2R1.

block-content-type

IN THIS SECTION

- Syntax | 2986
- Hierarchy Level | 2986
- Description | 2986
- Options | 2986
- Required Privilege Level | 2987
- Release Information | 2987

Syntax

```
block-content-type (activex | exe | http-cookie | java-applet | zip);
```

Hierarchy Level

```
[edit security utm default-configuration]
[edit security utm feature-profile content-filtering profile profile-name]
```

Description

Apply blocks to other available content such as exe, http-cookie, java-applet. This is for HTTP only.

Options

- `activex`—Block ActiveX.
- `exe`—Block EXE files.
- `http-cookie`—Block cookies.
- `java-applet`—Block Java applets.
- `zip`—Block ZIP files.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.5.

The `[edit security utm default-configuration]` hierarchy level is introduced in Junos OS Release 18.2R1.

block-extension

IN THIS SECTION

- Syntax | 2987
- Hierarchy Level | 2987
- Description | 2988
- Required Privilege Level | 2988
- Release Information | 2988

Syntax

```
block-extension extension-list;
```

Hierarchy Level

```
[edit security utm default-configuration]
[edit security utm feature-profile content-filtering profile profile-name]
```

Description

Apply block extensions to the content-filtering profile.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.5.

The `[edit security utm default-configuration]` hierarchy level is introduced in Junos OS Release 18.2R1.

block-frag (IDS Screen Next Gen Services)

IN THIS SECTION

- Syntax | 2988
- Hierarchy Level | 2988
- Description | 2989
- Required Privilege Level | 2989
- Release Information | 2989

Syntax

```
block-frag;
```

Hierarchy Level

```
[edit services screen ids-option screen-name ip]
```

Description

Identify and drop fragmented IP packets. IP fragments might contain an attacker's attempt to exploit the vulnerabilities in the packet reassembly code of specific IP stack implementations. When the target receives these packets, the results can range from processing the packets incorrectly to crashing the entire system.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 19.3R2.

block-message (Application Firewall)

IN THIS SECTION

- Syntax | 2990
- Hierarchy Level | 2990
- Description | 2990
- Options | 2991
- Required Privilege Level | 2992
- Release Information | 2992

Syntax

```
block-message type {
    custom-text content custom-html-text;
    custom-redirect-url content custom-redirect-url;
}
```

Hierarchy Level

```
[edit security application-firewall profile profile-name]
```

Description

Defines the profile of the notification to be sent to clients when HTTP or HTTPS traffic is blocked by a reject or deny action from an application firewall.

NOTE: The block message option is not supported for non-HTTP traffic such as FTP, SSH, Telnet, and so on. In these instances, if the action is drop or reject, the traffic is silently dropped or rejected. The user is not informed of the action and no redirection occurs. The associated system log message identifies the action taken for this traffic.

The reject or deny message actions are logged with the reason field containing one of the following phrases:

- appfw deny
- appfw reject

Following sample shows a system log message for SSH traffic, where the traffic was rejected:

```
RT_FLOW_SESSION_DENY [junos@2636.1.1.1.2.134 source-address="1.2.0.100" source-
port="53540" destination-address="1.1.0.100" destination-port="22" connection-tag="0"
service-name="junos-ssh" protocol-id="6" icmp-type="0" policy-name="p1" source-zone-
name="untrust" destination-zone-name="trust" application="SSH" nested-
application="UNKNOWN" username="N/A" roles="N/A" packet-incoming-interface="reth2.0"
encrypted="No" reason="appfw reject"]
```

> **NOTE**: You need to enable SSL forward proxy for the HTTPS traffic that needs to be blocked by a reject or a deny action from an application firewall.

When the `block-message` option is specified, a splash screen and message inform the client that the traffic has been blocked. The default message text is:

```
"username, Application Firewall has blocked your request to application application-name at dest-ip:dest-port  accessed from src-ip:source-port "
```

The variables in the message are replaced with specific traffic values. For clarity, the prefix **junos:** is truncated from the application name.

> **NOTE**: You need to enable SSL forward proxy for the HTTPS traffic,that needs to be blocked by a reject or a deny action from an application firewall.

Starting in Junos OS Release 18.2R1, the application firewall (AppFW) functionality is deprecated. As a part of this change, the `[edit security application-firewall]` hierarchy and all the configuration options under this hierarchy are deprecated— rather than immediately removed—to provide backward compatibility and an opportunity to bring your configuration into compliance with the new configuration.

Options

Use the following option pairs to customize the default message or to redirect the client to a custom webpage instead of the default splash screen.

> **NOTE**: Both the `type` and `content` fields must be used to add custom text or redirect the client to a URL.

- `type`—(Optional) The message type to be displayed after a reject or deny action.
  - `custom-text`—Text message in HTML to be added to the default text. If `custom-text` is specified, the splash screen displays both the default block message and the custom-defined block message.

    When specified, the user is redirected when a reject or deny action is taken during one of the following HTTP methods: GET, POST, OPTIONS, HEAD, PUT, DELETE, TRACE, CONNECT, PROPFIND, PROPPATCH, LOCK, UNLOCK, COPY, MOVE, MKCOL, BCOPY, BDELETE, BCOPY, BMOVE, BPROPFIND, BPROPPATCH, POLL, SEARCH, SUBSCRIBE, and UNSUBSCRIBE. If the reject or deny action occurs during a different HTTP method, the traffic is silently dropped.

- `custom-redirect-url`—URL redirection.

- `content`—(Optional) Message content for the selected message type.

> **NOTE**: The `content` value must match the `type` option selected: `custom-text` requires text, and `custom-redirect-url` requires a URL value.

  - *custom-text*—Custom text to be added to the splash screen. Custom text is inserted below the default message. Add the characters \n to insert a line break in the displayed text.

  - *custom-redirect-url*—The URL of the webpage to which the client is directed. When traffic is rejected or denied, the client is redirected to the specified webpage for further action. The URL can be hosted on either the SRX Series Firewall or an external server.

    Enter the redirect URL in quotation marks for an HTTP or HTTPS site, as shown in the following examples:

```
"http://custom-redirect-url"
"https://custom-redirect-url"
```

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1X45-D10.

blocklists (Security IKE)

IN THIS SECTION

- Syntax | 2997
- Hierarchy Level | 2998
- Description | 2998
- Options | 2998
- Required Privilege Level | 2999
- Release Information | 2999

Syntax

```
    blocklists {
        blocklist-name {
            description text-description;
            rule rule-name {
            match {
                    role (initiator | responder);
                    id-type (inet | inet6 | hostname | distinguished-name | user-at-hostname |
key-id);
                    id-pattern value;
             }
                then {
                    (discard | reject);
                    backoff timeout-value;
                }
            }
      }
  }
```

Hierarchy Level

```
[edit security ike]
```

Description

Defines the remote peer IKE identity blocklist(s) configuration.

In the configuration hierarchy, you can configure different blocklists for blocking IKE IDs during IKE SA negotiation authentication phase. Once you configure the blockslists, you can use a blocklist in the corresponding IKE policy at the `[edit security ike policy policy-name blocklist blocklist-name]` hierarchy level.

Options

blocklists *blocklist-name*

Specify the blocklist name.

- Value: upto 32 characters
- Max allowed: Upto 1000 blocklists

rule *rule-name*

Specify the rule name.

- Value: upto 32 characters
- Max allowed: Upto 1000 rules per blocklist

description *text-description*

(Optional) Specify the text description.

match

Match criteria.

id-type (inet | inet6 | hostname | distinguished-name | user-at-hostname | key-id)

Specify the remote peer IKE identity type with one of the following:

- `inet`—Specify to use the IPv4 address.
- `inet6`—Specify to use the IPv6 address.
- `hostname` —Specify to use the hostname.
- `distinguished-name`—Specify to use the distinguished name.
- `user-at-hostname`—Specify to use the email address
- `key-id`—Specify to use the Key ID

id-pattern *<value>*

Specify a valid remote peer IKE identity value based on the `id-type` selection. Use the standard regular expression for the value.

role (initiator| responder)

Specify the remote peer role as the `initiator` or the `responder`.

- Default: `initiator`

then

Action for the match criteria.

discard

Discard the peer connection immediately without sending back a response.

reject

Discard the connection immediately and send back a failure response.

backoff *timeout-value*

(Optional) Discard the connection immediately and set a backoff timer. If you do not configure the option explicitly, the `auth-phase-failure` *value* option at the [`edit security ike session half-open backoff-timeouts`] hierarchy level, enables backoff action.

- Value: Range is 1-180 seconds.
- Default: 60 seconds

For other statements, see CLI Explorer.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

`blocklists` statement introduced in Junos OS Release 23.4R1.

[edit protocols bgp],
[edit protocols bgp group group-name],
[edit protocols bgp group group-name neighbor address]
```

NOTE: 1. Complete BMP configuration, as mentioned in the syntax, can be done under the first two hierarchy levels only

2. Under other hierarchy levels, only the following configurations are supported:

- Either we can inherit or not inherit the configuration data
- Enable/disable monitoring
- Control route monitoring settings

Description

Configure the BGP Monitoring Protocol (BMP), which enables the routing device to collect data from the BGP Adjacency-RIB-In routing tables and periodically send that data to a monitoring station. The

`Adjacency-RIB-In` tables are the pre-policy tables, meaning that the routes in these tables have not been filtered or modified by routing policies.

BGP Monitoring Protocol (BMP) allows the Junos OS to send the BGP route information from the router to a monitoring application on a separate device. The monitoring application is called the BMP monitoring station or BMP station. To deploy BMP in your network, you need to configure BMP on each router and you also need to configure at least one BMP station.

> **NOTE**: When BMP is configured at multiple hierarchy levels, the order of preference from highest to lowest is as follows:
>
> 1. `[edit protocols bgp group group-name neighbor address bmp]`
> 2. `[edit protocols bgp group group-name bmp]`
> 3. `[edit protocols bgp bmp]`
> 4. `[edit routing-optionsbmp station station-name]`
> 5. `[edit routing-options bmp]`
>
> For example, if BMP is configured at both `[edit routing-options bmp]` and `[edit protocols bgp bmp]` hierarchy levels, the configuration at the protocols BGP level takes precedence over the routing options configuration.

Options

authentication-algorithm *algorithm*

Configure an authentication algorithm.

- **Values:** Specify one of the following types of authentication algorithms:
  - `aes-128-cmac-96`—Cipher-based message authentication code (AES128, 96 bits).
  - `hmac-sha-1-96`—Hash-based message authentication code (SHA1, 96 bits).
  - `md5`—Message digest 5.
- **Default:** `hmac-sha-1-96`

> **NOTE**: The default is not displayed in the output of the `show bgp bmp` command unless a key or key-chain is also configured.

authentication-key *key*

Configure an MD5 authentication key (password), which can be up to 126 characters. Characters can include any ASCII strings. If you include spaces,

enclose all characters in quotation marks (“ ”). Neighboring routing devices use the same password to verify the authenticity of BMP packets sent from this system.

authentication-key-chain *key-chain*

Apply and enable an authentication key chain to the routing device, which can be up to 126 characters. Characters can include any ASCII strings. If you include spaces, enclose all characters in quotation marks (“ ”).

> **NOTE**: You must also configure an authentication algorithm by including the `authentication-algorithm` *`algorithm`* statement.

Note that the referenced key chain must be defined. When configuring the authentication key update feature for BGP, you cannot commit the `0.0.0.0/allow` statement with authentication keys or key chains. The CLI issues a warning and fails to commit the configuration.

connection-mode (active | passive)

Specify whether the BMP station connection is `active` or `passive`. If you configure the connection-mode statement as `active`, do not also configure the `local-port` statement. If you configure the connection-mode statement as `passive`, you must configure the `local-port` statement.

If the connection-mode statement is configured as `active`, a station port number is required. If the `connection-mode` statement is configured as `passive`, you must not configure a station port number.

- **Values:** Specify one of the following:
  - active—BMP initiates the connection to the BMP station.
  - passive—BMP does not initiate a connection to the BMP station. However, it does listen for a connection request from active BMP stations and will connect if a station is available.

initiation-message *text*

(Optional) Specify a character string for a type 0 TLV to send to the BMP station with the initiation message. The message is transmitted when a BMP station establishes a connection to the device. You can provide some information to the BMP station system administrator (for example, a contact phone number). The initiation message includes a type 1 TLV containing the SNMP sysDescr value specified in RFC 1213 *Management Information Base for Network Management of TCP/IP-based internets: MIB-II* and a type 2 TLV containing the SNMP sysName value also from RFC 1213. The string in the initiation-message message is UTF-8.

The normal time for sending an initiation message is when the BMP session is first established. However, an initiation message change also triggers the transmission of an initiation message to current BMP sessions.

Another event that triggers the transmission of an initiation message is when you change in the sysName or sysDescr values in the SNMP configuration. The initiation message is sent to current BMP sessions.

- **Range:** 1 through 255 characters

in-memory-profiling

(Optional) Configure this option to collect time series data. Note that collection of time series data uses additional memory resources. Disable this option to free the memory used to store the time series data.

- **Default:** in-memory-profiling is disabled by default to ensure efficient memory utilization.

keep-advertisement-state

(Optional) Enable this option to store BMP advertisement state for rib-out monitoring. Note that this option can use up valuable resources. Disable this option to free the memory used to store BMP advertisement state. We recommend toggling the BMP session after changing deleting this option to have a cosistent view for all prefixes advertised to the station..

- **Default:** keep-advertisement-state is disabled by default to ensure efficient memory utilization.

local-address *address*

(Optional) Specifies the IPv4 or IPv6 address for the BMP connection on the device. We recommend that you configure a local address. For both active and passive connection modes, configure a loopback local address. This provides a consistent local endpoint, is useful for debugging, and assures greater reliability for the BMP connection since it is not tied to a single router interface.

For passive mode, specifying a local address is required. It also provides some security against a malicious BMP connection. For active mode, we also recommend configuring a local address to help ensure reliability.

If you change the local address, the BMP station connection flaps when you commit the configuration.

local-port *port*

Specify the listening port for the BMP station connection.

If you configure the connection-mode statement as `active`, do not configure the `local-port` statement. If you configure the connection-mode statement as `passive`, you must configure `local-port` statement.

If you change the local port, the BMP station connection flaps when you commit the configuration.

- **Range:** 1 through 65,535

max-loc-rib-buffer-count *count*

Specify the maximum number of local-rib outstanding buffers before blocking.

- **Range:** 1 through 50

monitor (enable | disable)

(Optional) Explicitly enable or disable BMP monitoring of BGP peers. You can also selectively enable or disable BMP monitoring at various hierarchy levels (for example, [`edit protocols bgp group` *`group-name`*] or [`edit protocols bgp group` *`group-name`* `neighbor` *`address`*]). If you disable BMP monitoring, withdrawal messages are sent for any previously advertised routes. These are followed by a down message. If you enable BMP monitoring, an up message is sent first and then the route advertisements follow.

- **Default:** BMP monitoring is enabled by default.
- **Values:** Specify one of the following:
  - disable—Disable BMP monitoring.
  - enable—Enable BMP monitoring.

priority (high | medium | low)

(Optional) Specify the dispatch priority for BMP. The dispatch priority controls the frequency with which the device is able to forward BMP messages to BMP stations.

> **NOTE**: Specifying `high` or `medium` priority may reduce the performance of the routing protocol process in its handling of route convergence or other work.

- **Default:** The default dispatch priority is `low`, to minimize interference with other routing protocol process priorities and to match the behavior of previous versions of BMP.
- **Values:** Specify one of the following:
  - high—The routing protocol process handles BMP requests with high urgency.
  - medium—The routing protocol process handles BMP requests with medium urgency.
  - low—The routing protocol process handles BMP requests with low urgency.

routing-instance *routing-instance-name*

Specify the name of the routing instance you want the BGP Monitoring Protocol (BMP) to use. This can be any routing instance name. If you want to use the reserved non-default management routing instance mgmt_junos, make sure you configure the `management-instance` statement.

When `routing-instance` is configured at both hierarchy levels— `[edit routing-options bmp station station-name]` and `[edit routing-options bmp]`— the configuration at the `[edit routing-options bmp station station-name]` hierarchy level takes precedence.

> **NOTE**: You must also configure the routing instance you want to use under the `[edit routing-instances]` hierarchy level.

- Values:
  - default—Default routing instance
  - routing-instance-name—Name of the routing instance

station *station-name*

(Required) Specify a name for the BMP monitoring station. Each station can use a significant amount of a device's resources. You can configure up to three BMP monitoring stations.

station-address (*address* | *station-name*

Specify the address or name for the BMP monitoring station. You can specify one or the other but not both.

- **Values:** Specify one of the following:
  - *station-address*—Specify the address for the BMP station. The address should be a valid IPv4 or IPv6 address.
  - *station-name*—Specify the name for the BMP station.

station-port *port*

Specify the port number for the BMP monitoring station. If the connection-mode statement is configured as `active`, a station port number is required. If the `connection-mode` statement is configured as `passive`, you must not configure a station port number.

- **Range:** 1 though 65535

statistics-timeout *seconds*

(Optional) Specify how often statistics messages are sent to the BMP monitoring station. If you configure a value of 0, no statistics messages are sent.

- **Default:** 3600 seconds
- **Range:** 15 though 65535 seconds

The remaining statements are explained separately. See CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.5.

Statement introduced for BMP in Junos OS Release 13.2X51-D15 for the QFX Series.

Support for BMP version 3 introduced in Junos OS Release 13.3.

`initiation-message`, `local-address`, `local-port`, `monitor`, `priority`, `route-monitoring`, `station`, `station-address`, `station-port`, and `statistics-timeout` options introduced in Junos OS Release 13.3.

`routing-instance` option introduced in Junos OS Release 18.3R1.

`rib-out` option introduced in Junos OS Release 19.1R1.

`loc-rib` option introduced in Junos OS Release 19.2R1.

`in-memory-profiling` and `keep-advertisement-state` options introduced in Junos OS Release 24.2R1.

boot-loader-authentication

IN THIS SECTION

Syntax | **3009**

- Hierarchy Level | 3009
- Description | 3009
- Options | 3010
- Required Privilege Level | 3010
- Release Information | 3010

Syntax

```
boot-loader-authentication {
    (encrypted-password password | plain-text-password);
}
```

Hierarchy Level

```
[edit system]
```

Description

Set the boot-loader password for accessing the U-Boot CLI during the boot process. The password can be entered either as a plain-text password or as an encrypted password.

Encrypted passwords must be entered in Message Digest 5 (MD5) format. Plain-text passwords are encrypted by using MD5 by default. The encryption format for plain-text passwords can be changed by using the `set system login password format` command.

Encrypted passwords must be between 1 and 128 characters long. The password must be enclosed in quotation marks and cannot be blank within the quotation marks (“ “).

The default requirements for plain-text passwords are as follows:

- The password must be between 6 and 128 characters long
- You can include most character classes in a password (uppercase letters, lowercase letters, numbers, punctuation marks, and other special characters). Control characters are not recommended.
- The password must contain at least one change of case or character class.

Options

`encrypted-password` *password*— Enter a password that has already been encrypted. You can specify only one encrypted password.

`plain-text-password`—Enter a plain-text password. The CLI prompts you for the password and then encrypts it. The CLI displays the encrypted version, and the software places the encrypted version in its user database. You can specify only one plain-text password.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2X51-D20.

Syntax

```
bootp {
    command binary-file-path;
    disable;
    failover (alternate-media | other-routing-engine);
}
```

Hierarchy Level

```
[edit system processes]
```

Description

Specify the booting process.

Options

- `command` *`binary-file-path`*—Path to the binary process.
- `disable` —Disable the booting process.
- `failover`—Configure the device to reboot if the software process fails four times within 30 seconds, and specify the software to use during the reboot.
  - `alternate-media`—Configure the device to switch to backup media that contains a version of the system if a software process fails repeatedly.

- `other-routing-engine`—Instruct the secondary Routing Engine to take primary role if a software process fails. If this statement is configured for a process, and that process fails four times within 30 seconds, then the device reboots from the secondary Routing Engine.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

bounded-delay

IN THIS SECTION

- Syntax | 3021
- Hierarchy Level | 3021
- Description | 3021
- Default | 3022
- Required Privilege Level | 3022
- Release Information | 3022

Syntax

```
bounded-delay;
```

Hierarchy Level

```
[edit security macsec connectivity-association connectivity-association-name mka (MX Series)]
```

Description

Configure bounded delay to ensure that a Media Access Control Security (MACsec) frame will not be delivered after a delay of two seconds or more. This ensures that a delay of MACsec frames resulting from a man-in-the-middle attack will not go undetected.

When you configure bounded delay, you must also configure replay protection by setting the "replay-window-size" on page 14385. This is the window during which duplicate and replay packets are allowed. Bounded delay takes precedence over replay protection. You can increase the effectiveness of bounded delay protection by configuring a lower value for the window size.

NOTE: Bounded delay impacts CPU utilization which can degrade performance. We recommend only configuring bounded delay on interfaces on which it is absolutely required.

Default

Bounded delay is not enabled by default.

Required Privilege Level

security

Release Information

Statement introduced in Junos OS Release 21.1R1.

bpdu-block

IN THIS SECTION

- Syntax | 3022
- Hierarchy Level | 3023
- Description | 3023
- Required Privilege Level | 3023
- Release Information | 3023

Syntax

```
bpdu-block {
    interface (interface-name disable | all);
    disable-timeout seconds;
}
```

Hierarchy Level

```
[edit protocols layer2-control ]
```

```
[edit ethernet-switching-options]
```

Description

Configures bridge protocol data unit (BPDU) protection on a specified interface or on all interfaces. If the interface receives incompatible BPDUs, it is disabled.

If the `disable-timeout` statement is included in the BPDU configuration, the interface is automatically reenabled after the timer expires. Otherwise, you must use the operational mode command `clear ethernet-switching bpdu-error interface` to unblock and reenable the interface.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.1.

(mstp | rstp | vstp)],
[edit protocols ( mstp | rstp| vstp )],
[edit routing-instances routing-instance-name protocols (mstp | rstp | vstp)]
```

Description

Configure bridge protocol data unit (BPDU) protection on all edge ports of a switch. When the `bpdu-block-on-edge` statement is configured and the interface encounters an incompatible BPDU, the interface shuts down.

If the `disable-timeout` statement is included in the BPDU configuration, the interface is automatically reenabled after the timer expires. Otherwise, you must use the operational mode command `clear ethernet-switching bpdu-error interface` to unblock and reenable the interface.

Default

Not enabled.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.1.

Statement updated in Junos OS Release 9.4 for EX Series switches to add VSTP support. Statement updated in Junos OS Release 11.1 for EX Series switches to change blocking behavior to port shutdown.

Support for logical systems added in Junos OS Release 9.6.

[edit routing-instances routing-instance-name protocols (mstp | rstp)]
```

Description

Enable MX Series router to participate in the provider Rapid Spanning Tree Protocol (RSTP) instance or a provider Multiple Spanning Tree Protocol (MSTP) instance.

Default

If the `bpdu-destination-mac-address` statement is not configured, the bridge participates in the customer RSTP instance, transmitting and receiving standard RSTP BPDU packets.

Options

provider-bridge-group—The destination MAC address of the BPDU packets transmitted is the provider bridge group address **01:80:c2:00:00:08**. Received BPDU packets with this destination MAC address are accepted and passed to the Routing Engine.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.2.

Support for logical systems added in Junos OS Release 9.6.

Description

Configures the bridge priority, which determines which bridge is elected as the root bridge. If two bridges have the same path cost to the root bridge, the bridge priority determines which bridge becomes the designated bridge for a LAN segment.

Default

32,768

Options

priority—The bridge priority can be set only in increments of 4096.

- **Range:** 0 through 61,440
- **Default:** 32,768

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.4.

Statement updated in Junos OS Release 9.4 for EX Series switches to add VSTP support.

Support for logical systems added in Junos OS Release 9.6.

Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number family family address address],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number
family family address address]
```

Description

Set the broadcast address on the network or subnet. On a subnet you cannot specify a host address of 0 (0.0.0.0), nor can you specify a broadcast address (255.255.255.255). For example, in the statement `set interface ge-0/0/0 unit 0 family inet address 10.1.1.0/24`, the subnet address `10.1.1.0` has the host address of 0. Hence, you cannot configure this address. Similarly, for the subnet, you cannot use the broadcast address `10.1.1.255/24`.

Default

The default broadcast address has a host portion of all ones.

Options

address—Broadcast address. The address must have a host portion of either all ones or all zeros. You cannot specify the addresses `0.0.0.0` or `255.255.255.255`.

NOTE: The `edit logical-systems` hierarchy is not available on QFabric systems.

- Options | 3048
- Required Privilege Level | 3049

Release Information | 3049

Syntax

```
buffer-dynamic-threshold value;
```

Hierarchy Level

```
[edit class-of-service schedulers]
```

Description

Adjust the maximum size of the shared-buffer pool at the egress buffer partition for each queue.

NOTE: This option is not supported for lossless queues.

During congestion or micro-burst scenarios, dedicated buffers can be exhausted, and queues start consuming from the shared buffer pool. The device dynamically calculates the limit of buffers that each queue can consume from the shared buffer pool based on the dynamic threshold setting called *alpha*. The purpose of alpha, or `buffer-dynamic-threshold`, is to scale the current free resources to determine an instantaneous threshold.

NOTE: You adjust the maximum size of the *global* shared-buffer pool by configuring the `dynamic-threshold` value at the `[edit class-of-service shared-buffer egress buffer-partition]` hierarchy level.

When you configure the buffer dynamic threshold at both the global and the scheduler (per-queue) level, the per-queue value takes precedence.

Options

`buffer-dynamic-threshold` ***`value`***	Threshold for maximum buffer share for a queue at the egress buffer partition.

Range: 0-10

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

buffer-partition (Egress)

IN THIS SECTION

- Syntax | 3049
- Hierarchy Level | 3050
- Description | 3050
- Default | 3050
- Options | 3051
- Required Privilege Level | 3051
- Release Information | 3051
- Platform-Specific Behavior | 3051

Syntax

```
buffer-partition (lossless | lossy | multicast) {
    percent percent;
```

```
    dynamic-threshold value;
}
```

Hierarchy Level

```
[edit class-of-service shared-buffer egress]
```

Description

The egress shared buffer pool is divided into three partitions. Each partition reserves a percentage of the available shared buffer pool for a type of traffic, so that the switch provides enough resources to support a mix of best-effort, lossless, and multicast traffic (multicast also includes broadcast and destination lookup fail traffic). To better support the mix of traffic on your network, you can optimize the allocation of egress shared buffers to different types of traffic by fine-tuning the shared buffer partitions.

The percentages you configure for the three egress shared buffer partitions must total exactly 100 percent. If the total of the three shared buffer percentages is not 100 percent, the system returns a commit error and does not commit the configuration. You can configure any partition to 0 (zero) percent as long as the allocation to other partitions totals 100 percent.

This is a global allocation that applies to all ports. All ports on the switch receive the same allocation of egress shared buffers.

If you do not configure buffer partitions, the switch uses the default partitioning.

CAUTION: Changing the buffer configuration is a disruptive event. Traffic stops on *all* ports until buffer reprogramming is complete.

Default

The default egress buffer partition shown in Table 7 on page 3051 supports networks with a balanced mix of best-effort, multicast, and lossless traffic. It is the recommended configuration if you are using the default configuration with two lossless forwarding classes.

Table 7: Default Egress Shared Buffer Partitioning

Lossless Partition	Lossy Partition	Multicast Partition
50%	31%	19%

The sum of the default percentages configured for each partition is 100 percent. The sum of the partition percentages must always total 100 percent.

Options

`dynamic-threshold` *value*	Threshold for maximum buffer share for a queue at the egress buffer partition.
`lossless`	Shared buffer space reserved for all lossless egress traffic.
`lossy`	Shared buffer space for best-effort unicast egress traffic.
`multicast`	Shared buffer space reserved for all multicast (including broadcast and destination lookup fail) egress traffic.
`percent` *percent*	The percentage of buffer space to allocate to the specified buffer partition (lossless, lossy, or multicast buffers). The sum of the percentages for the three buffer partitions must total 100 percent.

Required Privilege Level

interfaces—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3.

`dynamic-threshold` option introduced in Junos OS Release 19.1R1.

`dynamic-threshold` option introduced in Junos OS Evolved Release 19.4R1.

Platform-Specific Behavior

Use Feature Explorer to confirm platform and release support for specific features.

Use the following table to review platform-specific behavior for your platforms:

Platform	Difference
QFX5000 Series	QFX5000 Series switches running Junos OS Evolved support the `dynamic-threshold` option *only* for lossy egress buffer partitions and not for lossless or multicast partitions.

Syntax

```
buffer-partition (lossless | lossless-headroom | lossy) {
    percent percentage;
    dynamic-threshold value;
}
```

Hierarchy Level

```
[edit class-of-service shared-buffer ingress]
```

Description

The ingress shared buffer pool is divided into three partitions. Each partition reserves a percentage of the available shared buffer pool for a type of traffic, so that the switch provides enough resources to support a mix of best effort (best-effort unicast and multicast) and lossless traffic. To better support the mix of traffic on your network, you can optimize the allocation of ingress shared buffers to different types of traffic by fine-tuning the shared buffer partitions.

The percentages you configure for the three ingress shared buffer partitions must total exactly 100 percent. If the total of the three shared buffer percentages is not 100 percent, the system returns a commit error and does not commit the configuration. You can configure any partition to 0 (zero) percent as long as the allocation to other partitions totals 100 percent.

This is a global allocation that applies to all ingress traffic. All ports on the switch receive the same allocation of ingress shared buffers.

If you do not configure buffer partitions, the switch uses the default partitioning.

> ⚠ **CAUTION**: Changing the buffer configuration is a disruptive event. Traffic stops on *all* ports until buffer reprogramming is complete.

Default

The default ingress buffer partition shown in Table 8 on page 3054 supports networks with a balanced mix of best-effort, multicast, and lossless traffic. It is the recommended configuration if you are using the default configuration with two lossless forwarding classes.

Table 8: Default Ingress Shared Buffer Partitioning

Lossless Partition	Lossless-Headroom Partition	Lossy Partition
9%	45%	46%

The sum of the default percentages configured for each partition is 100 percent. The sum of the partition percentages always must total 100 percent.

Options

`dynamic-threshold` *`value`* — Threshold for maximum buffer share for a queue at the ingress buffer partition.

`lossless` — Shared buffer space reserved for all lossless ingress traffic.

`lossless-headroom` — Shared buffer space reserved to store packets received while either an 802.3x Ethernet PAUSE or a priority-based flow control (PFC) pause is asserted. (When an ingress interface pauses traffic, it must have the buffer space to store all of the packets currently in the buffer, and also all of the packets received before the connected peer stops sending traffic and the wire is cleared of packets.)

`lossy` — Shared buffer space for best-effort ingress traffic.

`percent` *`percent`* — The percentage of buffer space to allocate to the specified buffer partition (lossless, lossless-headroom, or lossy buffers). The sum of the percentages for the three buffer partitions must total 100 percent.

Required Privilege Level

interfaces—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3.

`dynamic-threshold` option introduced in Junos OS Release 19.1R1.

`dynamic-threshold` option introduced in Junos OS Evolved Release 19.4R1.

Platform-Specific Behavior

Use Feature Explorer to confirm platform and release support for specific features.

Use the following table to review platform-specific behavior for your platforms:

Platform	Difference
QFX5000 Series	QFX5000 Series switches use the `dynamic-threshold` option on lossless ingress buffer partitions to calculate the ECN threshold on lossless queues.

Aggregated Ethernet Interfaces

buffer-size

IN THIS SECTION

- Syntax | 3056
- Hierarchy Level | 3056
- Description | 3056
- Default | 3058
- Options | 3060

Required Privilege Level | 3060
Release Information | 3060

Syntax

```
buffer-size (percent percent | remainder);
```

```
buffer-size (exact | percent percentage | remainder | temporal microseconds);
```

Hierarchy Level

```
[edit class-of-service schedulers scheduler-name]
```

```
[edit class-of-service schedulers scheduler-name]
```

Description

Specify buffer size in a scheduler configuration.

On all switches, you configure the proportion of port buffers allocated to a particular output queue using the following process:

1. Configure a scheduler and set the `buffer-size` option.
2. Use a scheduler map to map the scheduler to the forwarding class that is mapped to the queue to which you want to apply the buffer size.

   For example, suppose that you want to change the dedicated buffer allocation for FCoE traffic. FCoE traffic is mapped to the fcoe forwarding class, and the fcoe forwarding class is mapped to queue 3 (this is the default configuration). To use default FCoE traffic mapping, in the scheduler map configuration, map the scheduler to the `fcoe` forwarding class.
3. If you are using enhanced transmission selection (ETS) hierarchical scheduling, associate the scheduler map with the traffic control profile you want to use on the egress ports that carry FCoE traffic. If you are using direct port scheduling, skip this step.

4. If you are using ETS, associate the traffic control profile that includes the scheduler map with the desired egress ports. For this example, you associate the traffic control profile with the ports that carry FCoE traffic. If you are using port scheduling, associate the scheduler map with the desired egress ports.

   Queue 3, which is mapped to the fcoe forwarding class and therefore to the FCoE traffic, receives the dedicated buffer allocation specified in the `buffer-size` statement.

> **NOTE**: The total of all of the explicitly configured buffer size percentages for all of the queues on a port cannot exceed 100 percent.

QFX10000 Switches

On QFX10000 switches, the buffer size is the amount of time in milliseconds of port bandwidth that a queue can use to continue to transmit packets during periods of congestion, before the buffer runs out and packets begin to drop.

The switch can use up to 100 ms total (combined) buffer space for all queues on a port. A buffer-size configured as one percent is equal to 1 ms of buffer usage. A buffer-size of 15 percent (the default value for the best effort and network control queues) is equal to 15 ms of buffer usage.

The total buffer size of the switch is 4 GB. A 40-Gigabit port can use up to 500 MB of buffer space, which is equivalent to 100 ms of port bandwidth on a 40-Gigabit port. A 10-Gigabit port can use up to 125 MB of buffer space, which is equivalent to 100 ms of port bandwidth on a 10-Gigabit port. The total buffer sizes of the eight output queues on a port cannot exceed 100 percent, which is equal to the full 100 ms total buffer available to a port. The maximum amount of buffer space any queue can use is also 100 ms (which equates to a 100 percent buffer-size configuration), but if one queue uses all of the buffer, then no other queue receives buffer space.

There is no minimum buffer allocation, so you can set the buffer-size to zero (0) for a queue. However, we recommend that on queues on which you enable PFC to support lossless transport, you allocate a minimum of 5 ms (a minimum buffer-size of 5 percent). The two default lossless queues, fcoe and no-loss, have buffer-size default values of 35 ms (35 percent).

Queue buffer allocation is dynamic, shared among ports as needed. However, a queue cannot use more than its configured amount of buffer space. For example, if you are using the default CoS configuration, the best-effort queue receives a maximum of 15 ms of buffer space because the default transmit rate for the best-effort queue is 15 percent.

If a switch experiences congestion, queues continue to receives their full buffer allocation until 90 percent of the 4 GB buffer space is consumed. When 90 percent of the buffer space is in use, the amount of buffer space per port, per queue, is reduced in proportion to the configured buffer size for each queue. As the percentage of consumed buffer space rises above 90 percent, the amount of buffer space per port, per queue, continues to be reduced.

On 40-Gigabit ports, because the total buffer is 4 GB and the maximum buffer a port can use is 500 MB, up to seven 40-Gigabit ports can consume their full 100 ms allocation of buffer space. However, if an eighth 40-Gigabit port requires the full 500 MB of buffer space, then the buffer allocations are proportionally reduced because the buffer consumption is above 90 percent.

On 10-Gigabit ports, because the total buffer is 4 GB and the maximum buffer a port can use is 125 MB, up to 28 10-Gigabit ports can consume their full 100 ms allocation of buffer space. However, if a 29th 10-Gigabit port requires the full 125 MB of buffer space, then the buffer allocations are proportionally reduced because the buffer consumption is above 90 percent.

QFX5100, EX4600, QFX3500, and QFX3600 Switches, and QFabric Systems

Set the dedicated buffer size of the egress queue that you bind the scheduler to in the scheduler map configuration. The switch allocates space from the global dedicated buffer pool to ports and queues in a hierarchical manner. The switch allocates an equal number of dedicated buffers to each egress port, so each egress port receives the same amount of dedicated buffer space. The amount of dedicated buffer space per port is not configurable.

However, the `buffer-size` statement allows you to control the way each port allocates its share of dedicated buffers to its queues. For example, if a port only uses two queues to forward traffic, you can configure the port to allocate all of its dedicated buffer space to those two queues and avoid wasting buffer space on queues that are not in use. We recommend that the buffer size should be the same size as the minimum guaranteed transmission rate (the `transmit-rate`).

Default

The default behavior differs on different switches.

QFX10000 Switches

If you do not configure buffer-size and you do not explicitly configure a queue scheduler, the default buffer-size is the default transmit rate of the queue. If you explicitly configure a queue scheduler, the default buffer allocations are not used. If you explicitly configure a queue scheduler, configure the buffer-size for each queue in the scheduler, keeping in mind that the total buffer-size of the queues cannot exceed 100 percent (100 ms).

Table 9 on page 3058 shows the default queue buffer sizes on QFX10000 switches. The default buffer size is the same as the default transmit rate for each default queue:

Table 9: Default Output Queue Buffer Sizes (QFX10000 Switches)

Queue Number	Forwarding Class	Transmit Rate	Buffer Size
0	best-effort	15%	15%

Table 9: Default Output Queue Buffer Sizes (QFX10000 Switches) *(Continued)*

Queue Number	Forwarding Class	Transmit Rate	Buffer Size
3	fcoe	35%	35%
4	no-loss	35%	35%
7	network-control	15%	15%

By default, only the queues mapped to the default forwarding classes receive buffer space from the port buffer pool. (Buffers are not wasted on queues that do not carry traffic.)

QFX5100, EX4600, QFX3500, and QFX3600 Switches, and QFabric Systems

The port allocates dedicated buffers to queues that have an explicitly configured scheduler buffer size. If you do not explicitly configure a scheduler buffer size for a queue, the port serves the explicitly configured queues first. Then the port divides the remaining dedicated buffers equally among the queues that have an explicitly attached scheduler *without* an explicitly configured buffer size configuration. (If you configure a scheduler, but you do not configure the buffer size parameter, the default is equivalent to configuring the buffer size with the `remainder` option.)

If you use the default scheduler and scheduler map on a port (no explicit scheduler configuration), then the port allocates its dedicated buffer pool to queues based on the default scheduling. Table 10 on page 3059 shows the default queue buffer sizes. The default buffer size is the same as the default transmit rate for each default queue:

Table 10: Default Output Queue Buffer Sizes (QFX5100, EX4600, QFX3500, and QFX3600 Switches, and QFabric Systems)

Queue Number	Forwarding Class	Transmit Rate	Buffer Size
0	best-effort	5%	5%
3	fcoe	35%	35%
4	no-loss	35%	35%
7	network-control	5%	5%

Table 10: Default Output Queue Buffer Sizes (QFX5100, EX4600, QFX3500, and QFX3600 Switches, and QFabric Systems) *(Continued)*

Queue Number	Forwarding Class	Transmit Rate	Buffer Size
8	mcast	20%	20%

By default, only the queues mapped to the default forwarding classes receive buffer space from the port buffer pool. (Buffers are not wasted on queues that do not carry traffic.)

On EX Series switches except EX4300 switches, the default scheduler transmission rate and buffer size percentages for queues 0 through 7 are 95, 0, 0, 0, 0, 0, 0, and 5 percent, respectively. On EX4300 switches, the default scheduler transmission rate and buffer size for queues 0 through 11 are 75, 0, 0, 5, 0, 0, 0, 0, 15, 0, 0 and 5 percent, respectively, of the total available buffer.

Options

percent *percent* — Percentage of the port dedicated buffer pool allocated to the queue (or queues) mapped to the scheduler.

remainder — Remaining dedicated buffer pool after the port satisfies the needs of the explicitly configured buffers. The port divides the remaining buffers equally among the queues that are explicitly attached to a scheduler but that do not have an explicit buffer size configuration (or are configured with `remainder` as the buffer size).

exact — Enforce the exact buffer size. When this option is configured, sharing is disabled on the queue, restricting the usage to guaranteed buffers only.

temporal *microseconds* — Buffer size as a temporal value.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.0.

Guidelines for Configuring Dynamic CoS for Subscriber Access

Configuring Schedulers in a Dynamic Profile for Subscriber Access

scheduler (Dynamic Scheduler Maps) | **16344**

buffer-size (Schedulers)

IN THIS SECTION

- Syntax | 3063
- Hierarchy Level | 3063
- Description | 3063
- Default | 3064
- Options | 3064
- Required Privilege Level | 3065
- Release Information | 3065

Syntax

```
buffer-size (percent percentage | remainder | shared | temporal microseconds);
```

Hierarchy Level

```
[edit class-of-service schedulers scheduler-name]
```

Description

Specify buffer size in a scheduler configuration.

You configure the proportion of port buffers allocated to a particular output queue using the following process:

1. Configure a scheduler and set the `buffer-size` option.
2. Use a scheduler map to map the scheduler to the forwarding class that is mapped to the queue to which you want to apply the buffer size.

   For example, suppose that you want to change the dedicated buffer allocation for best effort traffic. Best effort traffic is mapped to the best effort forwarding class, and the best effort forwarding class is

mapped to queue 0 (by default). To use default best effort traffic mapping, in the scheduler map configuration, map the scheduler to the `best-effort` forwarding class.

3. If you are using hierarchical scheduling, associate the scheduler map with the traffic control profile you want to use on the egress ports that carry best effort traffic. If you are using direct port scheduling, skip this step.

4. If you are using hierarchical scheduling, associate the traffic control profile that includes the scheduler map with the desired egress ports. For this example, you associate the traffic control profile with the ports that carry best effort traffic. If you are using port scheduling, associate the scheduler map with the desired egress ports.

   Queue 0, which is mapped to the best effort forwarding class and therefore to best effort traffic, receives the dedicated buffer allocation specified in the `buffer-size` statement.

> **NOTE**: The total of all of the explicitly configured buffer size percentages for all of the queues on a port cannot exceed 100 percent.

> **NOTE**: On PTX Series Packet Transport Routers, you cannot configure buffer-size on rate-limited queues.

Default

If you do not include this statement, the default scheduler transmission rate and buffer size percentages for queues 0 through 7 are 95, 0, 0, 5, 0, 0, 0, and 0 percent, respectively.

Options

`percent` *`percentage`*
Buffer size as a percentage of the total buffer.

- **Range:** 0 through 100

`remainder`
Remaining buffer available.

`shared`
On PTX Series routers, set a queue's buffer to be up to 100 percent of the interface's buffer. This option allows the queue's buffer to grow as large as 100 percent of the interface's buffer if and only if it is the only active queue for the interface.

`temporal` *`microseconds`*
Buffer size as a temporal value. The queuing algorithm starts dropping packets when it queues more than a computed number of bytes. This maximum is computed by multiplying the logical interface speed by the configured temporal value.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

`shared` option introduced in Junos OS Release 18.1.

Managing Congestion on the Egress Interface by Configuring the Scheduler Buffer Size

buffer-rate (Schedulers)

IN THIS SECTION

- Syntax | 3065
- Hierarchy Level | 3066
- Description | 3066
- Options | 3066
- Required Privilege Level | 3066
- Release Information | 3066

Syntax

```
buffer-rate (percent percent |  rate);
```

Hierarchy Level

```
[edit class-of-service schedulers scheduler-name]
```

Description

Configure the base rate for buffer size calculation. The buffer rate is the target rate of a VOQ, which is the intended egress queue rate during typical congestion. The target rate is an import parameter for VOQs, as the ratio of the drain rate to the target rate determines how much buffer adjustment happens at ingress.

The VOQ target rate is equal to the lesser of the buffer rate and the calculated shaping rate. If you don't define the buffer rate, then the VOQ target rate is equal to the scheduler transmit rate. If you also don't define the scheduler transmit rate, then the VOQ target rate is equal to the calculated shaping rate.

For platforms that support VOQs each ingress Packet Forwarding Engine (PFE) provides up to eight virtual output queues for a single egress port. The egress PFE distributes the bandwidth to each ingress virtual output queue; therefore they receive equal treatment regardless of their presented load. The drain rate of a queue is the rate at which a queue is draining. The egress Packet Forwarding Engine divides its bandwidth for each output queue equally across the ingress PFEs. So, the drain rate of each ingress PFE = drain rate of the output queue/number of ingress PFEs.

Options

percent *percentage*	Buffer rate as a percentage of the total buffer. • **Range:** 0 through 100
rate	Buffer rate as an absolute value.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

bulk-call-mode

IN THIS SECTION

- Syntax | 3067
- Hierarchy Level | 3067
- Description | 3067
- Required Privilege Level | 3068
- Release Information | 3068

Syntax

```
bulk-call-mode;
```

Hierarchy Level

```
[edit security alg sip ]
```

Description

When there are multiple users behind SIP proxies at either end of an SRX, with multiple SIP calls ongoing between the users via these SIP proxies and through the device, and all SIP traffic is using the same 5 tuples, this results in a single SIP control session on the device, referred to as SIP bulk call or a SIP "fat" session.

To load balance such SIP calls on the device, the command `set security alg sip bulk-call-mode` can be used. When enabled, SIP call ID is used to identify and distribute the SIP calls among different SPUs instead of the regular 5 tuples, resulting in individual control sessions for each SIP call.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 20.4R1.

bulk-leasequery (DHCP Relay Agent)

IN THIS SECTION

- Syntax | 3068
- Hierarchy Level | 3069
- Description | 3069
- Options | 3069
- Required Privilege Level | 3070
- Release Information | 3070

Syntax

```
bulk-leasequery {
    attempts number-of-attempts;
    timeout seconds;
    trigger automatic;
}
```

Hierarchy Level

```
[edit forwarding-options dhcp-relay],
[edit forwarding-options dhcp-relay dhcpv6],
[edit logical-systems logical-system-name ...],
[edit logical-systems logical-system-name routing-instances routing-instance-name ...],
[edit routing-instances routing-instance-name ...]
```

Description

Enable support for bulk leasequery on a DHCPv4 or DHCPv6 relay agent. You can also configure parameters that the DHCP relay agent uses when sending DHCP bulk leasequery messages to obtain lease information from the DHCP local servers in the logical system/routing instance.

> **NOTE**: You must also configure support on the relevant DHCP local servers with the "allow-leasequery" on page 2191 statement.

Options

attempts *number-of-attempts*

Specify the number of times the DHCP relay agent attempts to send DHCP bulk leasequery messages to the configured DHCP servers in the logical system/routing instance. DHCP relay agent resends the query message if the configured `timeout` value is reached, and either a confirmed reply or a reply from all configured DHCP servers has not been received. DHCP relay agent sends the subsequent messages only to the DHCP servers that have not replied to previous queries.

- Range:
  - (DHCPv4 bulk leasequery) 1 through 10
  - (DHCPv6 bulk leasequery) 1 through 720
- Default:
  - (DHCPv4 bulk leasequery) 6
  - (DHCPv6 bulk leasequery) 360

timeout *seconds*

Specify the number of seconds that DHCP relay agent waits before resending a leasequery message to the DHCP servers when all servers have not responded to a previous message.

- **Range:** 1 through 10
- **Default:** 10

trigger automatic (DHCPv6 only) Specify that the DHCPv6 relay agent always sends a bulk leasequery message whenever the jdhcp daemon is started or restarted and there are no bound subscribers in the session database. The automatic trigger updates the DHCP relay agent's binding information for clients associated with the requesting DHCPv6 relay agent.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

```

- For ACX Series routers, PTX Series routers and QFX Series switches:

```
[edit system ddos-protection protocols protocol-group  (aggregate | packet-type)]
```

Description

Configure the DDoS burst limit; that is, the maximum number of packets that is allowed in a burst of traffic by the specified policer. When this value is exceeded, a violation is declared.

Options

size—Number of packets that are allowed in a burst by the aggregate or packet-type policer.

- **Range:** 1 through 100,000 packets
- **Default:** The default burst value varies by packet type or protocol. You can view the default values for all packet types or protocols on an unconfigured router or switch by entering the `show ddos-protection protocols parameters brief` command from operational mode. For ACX Series routers, PTX Series routers and QFX Series switches, the default bandwidth limits are also provided in the "protocols (DDoS) (ACX Series, PTX Series, and QFX Series)" on page 13765 statement description.

burst-size

IN THIS SECTION

- Syntax | 3079
- Hierarchy Level | 3079
- Description | 3079
- Default | 3080

- Options | 3080
- Required Privilege Level | 3080
- Release Information | 3081

Syntax

```
burst-size bytes;
```

Hierarchy Level

```
[edit forwarding-options storm-control-profiles profile-name all]
```

Description

Configure the number of bytes of bursting traffic allowed to pass through a storm control interface. The burst size allows for short periods of back-to-back traffic at average rates that exceed the storm control level. If either the burst size or rate exceeds the limit, traffic will be dropped.

Storm control enables the switch to monitor traffic levels and to drop broadcast, multicast, and unknown unicast packets when a specified traffic level—called the storm control level—is exceeded, thus preventing these packets from proliferating and causing a traffic storm. Storm control can also shut down the interface in the event of a traffic storm.

The storm control level is a limit on bandwidth, which is configured using either the `bandwidth-limit` statement or the `bandwidth-percent` statement. The burst size extends the bandwidth limit so that sudden bursts of traffic do not cause storm control to drop packets or shut down the interface.

Because one burst size is not suitable for every traffic pattern, select the best burst size for an interface by performing experimental configurations. For your first test configuration, select the burst size limit by using one of the following methods.

The preferred method for determining the burst size is by using the following values:

- bandwidth—line rate of the storm control interface (in bps units)

- burst-period—allowable traffic-burst time (in milliseconds)

BEST PRACTICE: We recommend you set the burst size value to the amount of traffic that can be sent over the interface in 5 milliseconds. For example, if your interface is configured with a 100 Mbps bandwidth limit, the recommended value would be 62,500 bytes. This value is derived using the bandwidth and burst-period, as follows:

- Convert the bandwidth (100 Mbps) to bps units.
- Multiply by the burst-period (5 milliseconds or 0.005 seconds).
- Divide by 8 to convert from bits to bytes.

```
                    100,000,000 bps x 0.005 s
100 Mbps x 5 ms  =  ------------------------  =  62,500 bytes
                       8 bits per byte
```

If you do not know the bandwidth of the interface, you can calculate the burst size using the maximum transmission unit (MTU). The burst size limit should not be set lower than 10 times the MTU of the traffic on the interface.

For more information on burst size calculation, see *Determining Proper Burst Size for Traffic Policers*.

Default

If you do not configure the allowed burst size, a traffic burst in excess of the storm control level might cause storm control to drop traffic or to shut down the interface.

Options

bytes—Burst size limit in bytes.

- **Range:** 1,500 through 100,000,000 bytes
- **Default:** 1,500 kilobits (187,500 bytes)

```

Description

For a single-rate two-color policer, configure the burst size as a number of bytes. The burst size allows for short periods of traffic bursting (back-to-back traffic at average rates that exceed the configured bandwidth limit). Single-rate two-color policing uses the *single token bucket algorithm* to measure traffic-flow conformance to a two-color policer rate limit.

Traffic at the interface that conforms to the bandwidth limit is categorized green. Traffic that exceeds the specified rate is also categorized as green provided that sufficient tokens remain in the single token bucket. Packets in a green flow are implicitly marked with `low` packet loss priority and then passed through the interface.

Traffic that exceeds the specified rate when insufficient tokens remain in the single token bucket is categorized red. Depending on the configuration of the two-color policer, packets in a red traffic flow might be implicitly discarded; or the packets might be re-marked with a specified forwarding class, a specified PLP, or both, and then passed through the interface.

The burst size extends the function of the bandwidth limit (configured using either the `bandwidth-limit` *`bps`* statement or the `bandwidth-percent` *`percentage`* statement) to allow bursts of traffic up to a limit based on the overall traffic load:

- When a single-rate two-color policer is applied to the input or output traffic at an interface, the initial capacity for traffic bursting is equal to the number of bytes specified by this statement.
- During periods of relatively low traffic (traffic that arrives at or departs from the interface at overall rates below the token arrival rate), unused tokens accumulate in the bucket, but only up to the configured token bucket depth.

Single-rate two-color policing allows bursts of traffic for short periods, whereas single-rate and two-rate three-color policing allows more sustained bursts of traffic.

Hierarchical policing is a form of two-color policing that applies different policing actions based on whether the packets are classified for expedited forwarding (EF) or for a lower priority. You apply a hierarchical policer to ingress Layer 2 traffic to allows bursts of EF traffic for short period and bursts of non-EF traffic for short periods, with EF traffic always taking precedence over non-EF traffic.

The burst-size limit enforced is based on the burst-size limit you configure. For a rate-limited logical interface, the Packet Forwarding Engine calculates the optimum burst-size-limit values and then applies the value closest to the burst-size-limit value specified in the policer configuration.

On MX Series routers and EX Series switches, the burst-size limit is not as freely configurable as it is on other platforms. Junos OS does not support an unlimited combination of policer bandwidth and burst-size limits on MX Series routers and EX Series switches. For a single-rate two-color policer on an MX Series router and on an EX Series switch, the minimum supported burst-size limit is equivalent to the amount of traffic allowed by the policer bandwidth limit in a time span of 1 millisecond. For example, for a policer configured with a `bandwidth-limit` value of 1 Gbps, the minimum supported value for `burst-size-`

`limit` on an MX Series router is 125 KB. If you configure a value that is smaller than the minimum, Junos OS overrides the configuration and applies the actual minimum.

Options

bytes—Burst-size limit in bytes. The minimum recommended value is the maximum transmission unit (MTU) of the IP packets being policed. You can specify the value either as a complete decimal number or as a decimal number followed by the abbreviation `k` (1000), `m` (1,000,000), or `g` (1,000,000,000).

Syntax

```
burst-size {
    apply-groups [group-names];
    apply-groups-except [group-names];
    downlink downlink-burst-size;
```

```
    uplink uplink-burst-size ;
}
```

Hierarchy Level

```
[edit unified-edge gateways tdf gateway-name domains domain-name]
```

Description

Configure the TDF domain's default TDF subscriber allowed burst size for uplink and downlink traffic. Uplink traffic originates from the subscriber towards the public data network (PDN), and downlink traffic comes from the PDN and is destined for the subscriber.

Options

downlink-burst-size

Burst size value for the downlink direction.

- **Range:** 1500 through 1,500,000,000 bytes.

uplink-burst-size

Burst size value for the uplink direction.

- **Range:** 1500 through 1,500,000,000 bytes.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

unified-edge—To view this statement in the configuration.

unified-edge-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.1.

    }
    maximum number;
    packets number;
    rate number;
}
```

Hierarchy Level

```
[edit services ids rule rule-name term term-name then session-limit]
```

Description

Configure the IDS rule session limits for an individual destination address or subnet. This protects against network probing attacks and network flooding attacks. This IDS rule can only be assigned to a service set on an MS-MPC.

When a session limit is exceeded for a destination, packets to the destination are dropped until the session limit is no longer exceeded.

To specify limits for destination subnets rather than individual addresses, include the `aggregation` statement at the `[edit services ids rule rule-name term term-name then]` hierarchy level.

Options

maximum *number* Specify the maximum number of concurrent sessions allowed for an individual destination address or subnet.

packets *number* Specify the maximum number of packets per second allowed for an individual destination address or subnet.

rate *number* Specify the maximum number of connections per second allowed for an individual destination address or subnet.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

bypass-queuing-chip

IN THIS SECTION

- Syntax | 3114
- Hierarchy Level | 3114
- Description | 3114
- Required Privilege Level | 3115
- Release Information | 3115

Syntax

```
bypass-queuing-chip;
```

Hierarchy Level

```
[edit interfaces interface-name]
```

Description

On MPCs that contain a queuing chip and on vMX routers, bypass the queuing chip to increase the available bandwidth when rich queuing features are not required. When applied on a vMX router, this option saves a vCPU.

CAUTION: When enabling this option, do not oversubscribe the port bandwidth. Also, after committing this change on a vMX router, you must reboot the MPC that contains the interface.

NOTE: This option requires "flexi-queuing-mode" on page 7233 to be enabled.

NOTE: Once you apply this option:

- You cannot configure either `per-unit-scheduler` or `hierarchical-scheduler` on the interface.
- You can no longer apply schedulers or shapers to the interface.
- Ingress queuing does not work on the interface.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.2.

bypass (Signaled LSP)

IN THIS SECTION

- Syntax | 3116
- Hierarchy Level | 3116
- Description | 3116
- Options | 3116
- Required Privilege Level | 3117
- Release Information | 3117

Syntax

```
bypass bypass-name {
    bandwidth bps;
    description text;
    hop-limit number;
    no-cspf;
    path address <strict | loose>;
    priority setup-priority reservation-priority;
    subscription subscription-percentage;
    to address;
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols rsvp interface interface-name link-
protection],
[edit protocols rsvp interface interface-name link-protection]
```

Description

Enables you to configure specific bandwidth and path constraints for a bypass LSP. It is possible to individually configure multiple bypass LSPs. If you do not configure the bypass LSPs individually, they all share the same path and bandwidth constraints.

If you specify the `bandwidth`, `hop-limit`, and `path` statements for the bypass LSP, these values take precedence over the values configured at the `[edit protocols rsvp interface interface-name link-protection]` hierarchy level. The other attributes (`subscription`, `no-node-protection`, and `optimize-timer`) are inherited from the general constraints.

Options

bypass-name (Required) Specify a name for the bypass LSP. The name can be up to 64 characters.

description Provides a textual description of the bypass LSP. Enclose any descriptive text that includes spaces in quotation marks (" "). Any descriptive text you include is displayed in the output of the `show mpls lsp bypass detail` command and has no effect on the operation of the bypass LSP. The description text can be no more than 80 characters in length.

subscription ***subscription-percentage***

(Optional) Specify the subscription percentage per manual bypass LSP. The subscription percentage configured under a particular manual bypass LSP overrides the subscription percentage configured commonly for all manual bypass LSPs under an interface.

- **Range:** 0 through 65000

to ***address***

(Required) Specify the address for the interface of the immediate next-hop node (for link protection) or the next-next-hop node (for node-link protection). The address specified determines whether this is a link protection bypass or a node-link protection bypass. On multiaccess networks (for example, a LAN), this address is also used to specify which next-hop node is being protected.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

`description` option was added in Junos OS Release 10.4.

Release Information

Statement introduced in Junos OS Release 10.1.

Statement introduced in Junos OS Release 19.3R2 on MX240, MX480 and MX960 routers using the MX-SPC3 services card.

RELATED DOCUMENTATION

Configuring Service Sets to be Applied to Services Interfaces

bypass-traffic-on-pic-failure

IN THIS SECTION

- Syntax | 3120
- Hierarchy Level | 3121
- Description | 3121
- Required Privilege Level | 3121
- Release Information | 3121

Syntax

```
bypass-traffic-on-pic-failure;
```

Hierarchy Level

```
[edit services service-set service-set-options]
```

Description

When the MultiServices PIC configured for a service set is either administratively taken offline or undergoes a failure, all the traffic entering the configured interface with an IDP service set would be dropped without notification. To avoid this traffic loss, include the `bypass-traffic-on-pic-failure` statement. When this statement is configured, the affected packets are forwarded in the event of a MultiServices PIC failure or offlining, as though interface-style services were not configured.

This issue applies only to Junos Application Aware (previously known as Dynamic Application Awareness) configurations with IDP service sets.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.1.

RELATED DOCUMENTATION

Configuring Service Sets to be Applied to Services Interfaces

bytes (Dynamic Traffic Shaping)

IN THIS SECTION

- Syntax | 3122
- Hierarchy Level | 3122

- Description | 3122
- Options | 3122
- Required Privilege Level | 3122
- Release Information | 3123

Syntax

```
bytes bytes | $junos-cos-byte-adjust;
```

Hierarchy Level

```
[edit dynamic-profiles profile-name class-of-service traffic-control-profiles profile-name overhead-accounting],
[edit class-of-service traffic-control-profiles profile-name overhead-accounting]
```

Description

Configure the number of overhead bytes.

Options

bytes—Byte adjustment value for the `cell-mode` or `frame-mode` shaping options. This can be the predefined variable `$junos-cos-byte-adjust`, which is the variable for byte adjustment that is replaced with a value obtained from the RADIUS server when a subscriber authenticates over the interface to which the dynamic profile is attached.

> **BEST PRACTICE**: We recommend using the `cell-mode cell-mode-bytes cell-mode-bytes` option or the `frame-mode frame-mode-bytes frame-mode-bytes` option rather than the `bytes` option.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.2.

bytes (otn-options)

IN THIS SECTION

- Syntax | 3123
- Hierarchy Level | 3123
- Description | 3124
- Options | 3124
- Required Privilege Level | 3124
- Release Information | 3124

Syntax

```
bytes transmit-payload-type value;
```

Hierarchy Level

```
[edit interfaces interface-name otn-options]
```

Description

Specify the transmit payload type on OTN header bytes.

Options

value—Transmit payload type.

- **Range:** 0 through 255 bytes

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2.

Statement introduced in Junos OS Release 19.2R1-S1 for ACX5448-D routers.

c-timeout

IN THIS SECTION

- Syntax | 3153
- Hierarchy Level | 3153
- Description | 3153
- Options | 3153

Required Privilege Level | 3153
Release Information | 3154

Syntax

```
c-timeout value-in-minutes;
```

Hierarchy Level

```
[edit logical-systems name security alg sip],
[edit logical-systems name tenants name security alg sip],
[edit security alg sip],
[edit services alg sip],
[edit tenants name security alg sip]
```

Description

Configure the c-timeout parameter to Specify the time out interval for Session Initiation Protocol (SIP) transactions in minutes.

Options

value-in-minutes—Timeout interval.

- **Range:** 3 through 10 minutes
- **Default:** 3 minutes

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

RELATED DOCUMENTATION

sip (Security) | 27977

ca-chain (REST API)

IN THIS SECTION

- Syntax | 3154
- Hierarchy Level | 3154
- Description | 3154
- Required Privilege Level | 3155
- Release Information | 3155

Syntax

```
ca-chain ca-chain;
```

Hierarchy Level

```
[edit system services rest https]
```

Description

Configure Certificate authority chain profile to perform https REST API request using mutual and server authentications.

Required Privilege Level

system

Release Information

Statement introduced in Junos OS Release 20.4R1.

ca-identity

IN THIS SECTION

- Syntax | 3155
- Hierarchy Level | 3155
- Description | 3155
- Options | 3156
- Required Privilege Level | 3156
- Release Information | 3156

Syntax

```
ca-identity ca-identity;
```

Hierarchy Level

```
[edit security pki ca-profile ca-profile-name]
```

Description

Specify the certificate authority (CA) identity to use in requesting digital certificates for J Series Services Routers and Adaptive Services (AS) and MultiServices PICs installed in M Series and T Series routers.

Options

ca-identity—The name of the CA identity. This name is typically the domain name of the CA.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 7.5.

RELATED DOCUMENTATION

Specifying the CA Profile Name

ca-name

IN THIS SECTION

- Syntax | 3156
- Hierarchy Level | 3157
- Description | 3157
- Options | 3157
- Required Privilege Level | 3157
- Release Information | 3157

Syntax

```
ca-name ca-identity;
```

Hierarchy Level

```
[edit security certificates certification-authority]
```

Description

(Encryption interface on M Series and T Series routers and EX Series switches only) Specify the certificate authority (CA) identity to use in the certificate request.

Options

ca-identity—CA identity to use in the certificate request.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

RELATED DOCUMENTATION

Specifying the Certificate Authority Name

ca-profile (Security PKI)

IN THIS SECTION

- Syntax | 3158
- Hierarchy Level | 3158
- Description | 3158

- Options | 3158
- Required Privilege Level | 3160
- Release Information | 3160

Syntax

```
ca-profile ca-profile-name {
    administrator {
        e-mail-address e-mail-address;
    }
    ca-identity ca-identity ;
    enrollment {
            retry number;
            retry-interval seconds;
            url url-name;
    }
    proxy-profile;
    revocation-check;
    routing-instance routing-instance-name ;
    source-address ip-address;
}
```

Hierarchy Level

```
[edit security pki]
```

Description

Configure certificate authority (CA) profile. The CA profile contains the name and URL of the CA or RA, as well as retry-timer settings.

Options

ca-profile-name Name of a trusted CA.

administrator *email-address*
Specify an administrator e-mail address to which the certificate request is sent. By default, there is no preset e-mail address.

ca-identity
Specify the certificate authority (CA) identity to use in requesting digital certificates. This name is typically the domain name of the CA.

enrollment
Specify the enrollment parameters for a certificate authority (CA).

retry *number*
Number of automated attempts for online enrollment to be retried in case enrollment response is pending.

- **Range:** 0 through 1080
- **Default:** 10

retry-interval *seconds*
Time interval between the enrollment retries.

- **Range:** 0 through 3600
- **Default:** 900 seconds

url *url-name*
Enrollment URL where the Simple Certificate Enrollment Protocol (SCEP) or CMPv2 request is sent to the certification authority (CA) as configured in this profile. With SCEP, you enroll CA certificates with the `request security pki ca-certificate enroll` command and specify the CA profile. There is no separate command to enroll CA certificates with CMPv2. The IP address in the enrollment URL can be an IPv4 or an IPv6 address.

proxy-profile
Use specified proxy server. If proxy profile is configured in CA profile, the device connects to the proxy host instead of the CA server while certificate enrollment, verification or revocation. The proxy host communicates with the CA server with the requests from the device, and then relay the response to the device.

Public key infrastructure (PKI) uses proxy profile configured at the system-level. The proxy profile being used in the CA profile must be configured at the `[edit services proxy]` hierarchy. There can be more than one proxy profile configured under `[edit services proxy]` hierarchy. Each CA profile is referred to the most one such proxy profile. You can configure host and port of the proxy profile at the `[edit system services proxy]` hierarchy.

revocation-check
Specify the method the device uses to verify the revocation status of digital certificates.

routing-instance
Specify the routing-instance to be used.

source-address Specifies a source IPv4 or IPv6 address to be used instead of the IP address of the egress interface for communications with external servers. External servers are used for certificate enrollment and reenrollment using Simple Certificate Enrollment Protocol (SCEP) or Certificate Management Protocol version 2 (CMPv2), downloading certificate revocation lists (CRLs) using HTTP or LDAP, or checking certificate revocation status with Online Certificate Status Protocol (OCSP). If this option is not specified then the IP address of the egress interface is used as the source address.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement modified in Junos OS Release 8.5. Support for `ca-identity` option is added in Junos OS Release 11.1. Support for `ocsp` and `use-ocsp` options added in Junos OS Release 12.1X46-D20.

Support for `proxy-profile` option is added in Junos OS Release 18.2R1.

Support for `source-address` is introduced in Junos OS Release 15.1X49-D60.

ca-profile (Services)

IN THIS SECTION

- Syntax | 3161
- Hierarchy Level | 3161
- Description | 3161
- Required Privilege Level | 3161
- Release Information | 3161

Syntax

```
ca-profile ca-profile;
```

Hierarchy Level

```
[edit services unified-access-control infranet-controller hostname]
```

Description

Specify the certificate authority (CA) of the certificate that the SRX Series Firewall should use in communications with an Infranet Enforcer. The SRX Series Firewall uses the CA to validate the IC Series UAC Appliance server certificate.

Use this statement if you have loaded certificates from multiple certificate authorities (CAs) onto your SRX Series Firewall and you need to configure the device to act as a Junos OS Enforcer in a Unified Access Control (UAC) deployment. When deployed as a Junos OS Enforcer, the SRX Series Firewall enforces the policies that are defined on the UAC's IC Series appliance .

Required Privilege Level

services—To view this statement in the configuration.

services-control—To add this statement to the configuration.

Statement introduced in Junos OS Release 9.4.

ca-type

IN THIS SECTION

- Syntax | 3162
- Hierarchy Level | 3162

- Description | 3162
- Default | 3162
- Options | 3162
- Required Privilege Level | 3163
- Release Information | 3163

Syntax

```
ca-type type {
    ca-value value;
}
```

Hierarchy Level

```
[edit protocols lldp-med interface (all | interface-name location civic-based)]
```

Description

For Link Layer Discovery Protocol–Media Endpoint Device (LLDP-MED), configure the location types and values that comprise the location information advertised from the device to the MED. This information is used during emergency calls to identify the location (civic or postal address) of the caller.

For further information about the types and values that can be used to comprise the location, refer to RFC 4776, *Dynamic Host Configuration Protocol (DHCPv4 and DHCPv6) Option for Civic Addresses Configuration Information*. A subset of those types, with sample values, is provided below.

Default

Disabled.

Options

ca-type *type* Specify category codes that together with values represent information about the civic or postal address of the caller's location. The address is divided into information types, with

each information type represented by a code. Some of the codes, with corresponding sample values for the ca-value option, are:

- 0—A code that specifies the language used to describe the location.
- 16—The leading-street direction, such as “N”.
- 17—A trailing street suffix, such as “SW”.
- 18—A street suffix or type, such as “Ave” or “Road”.
- 19—A house number, such as “6450”.
- 20—A house-number suffix, such as “A” or “1/2”.
- 21—A landmark, such as “Stanford University”.
- 22—Additional location information, such as “South Wing”.
- 23—The name and occupant of a location, such as “Carrillo's Holiday Market”.
- 24—A house-number suffix, such as “95684”.
- 25—A building structure, such as “East Library”.

ca-value *value* Configure location information (civic or postal address) that is indexed by the ca-type code. This value has a maximum size of 248 characters. See the description of the ca-type option for examples.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.0.

cable-length (Congestion Notification)

IN THIS SECTION

- Syntax | 3164
- Hierarchy Level | 3164
- Description | 3164
- Default | 3165
- Options | 3165
- Required Privilege Level | 3165
- Release Information | 3165

Syntax

```
cable-length cable-length-value;
```

Hierarchy Level

```
[edit class-of-service congestion-notification-profile profile-name input]
```

Description

Specify the length of the cable between the interface and its peer interface in meters. The system uses the cable length and the maximum receive unit (MRU) to calculate the amount of buffer headroom reserved to support priority-based flow control (PFC). The the shorter the cable length and lower the MRU, the less headroom buffer space is required for PFC.

NOTE: You can also set a maximum transmission unit (MTU) value (the largest packet size the interface sends) for interfaces by including the `mtu` statement at the `[edit interfaces interface-name]` hierarchy level.

Default

The default cable length value is 100 meters (approximately 328 feet).

Options

cable-length-value—Length of the cable in meters. (Generally from 1 to 300 meters, but there is no configuration restriction.)

Required Privilege Level

interfaces—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3.

cak

IN THIS SECTION

- Syntax | 3174
- Hierarchy Level | 3174
- Description | 3174
- Default | 3175
- Options | 3175
- Required Privilege Level | 3175
- Release Information | 3175

Syntax

```
ckn hexadecimal-number;
```

Hierarchy Level

```
[edit security macsec connectivity-association connectivity-association-name pre-shared-key],
[edit security macsec connectivity-association connectivity-association-name fallback-key]
```

Description

Specifies the connectivity association key (CAK) for a preshared key.

A preshared key includes a connectivity association key name (CKN) and a CAK. A preshared key is exchanged between two devices at each end of a point-to-point link to enable MACsec using dynamic security keys. The CKN is a 64-digit hexadecimal number and the CAK is a 32-digit hexadecimal number.

The MACsec Key Agreement (MKA) protocol is enabled once the preshared keys are successfully exchanged. The preshared key—the CKN and CAK—must match on both ends of a link.

To configure MACsec on the supported ports, you need to create the preshared key by configuring the connectivity association key name (CKN) and connectivity association key (CAK).

Default

No CAK exists, by default.

Options

hexadecimal-number

The key name, in hexadecimal format.

For AES-128 the CAK key length is 32 hexadecimal characters, and for AES-256 it is 64. If you enter a key name with fewer characters than the standard (32 for cipher-suite gcm-aes-128, and 64 for cipher-suite gcm-aes-256), Junos will automatically fill in the remaining characters with zeros.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2X50-D15.

Statement introduced for SRX devices in Junos OS Release 15.1X49-D60.

cak (MX Series)

IN THIS SECTION

- Syntax | 3176
- Hierarchy Level | 3176
- Description | 3176
- Default | 3176
- Options | 3177
- Required Privilege Level | 3177
- Release Information | 3177

Syntax

```
cak hexadecimal-number;
```

Hierarchy Level

```
[edit security macsec connectivity-association connectivity-association-name pre-shared-key]
```

Description

Specifies the connectivity association key (CAK) for a pre-shared key.

A pre-shared key includes a connectivity association key name (CKN) and a CAK. A pre-shared key is exchanged between two devices at each end of a point-to-point link to enable MACsec using dynamic security keys. The MACsec Key Agreement (MKA) protocol is enabled once the pre-shared keys are successfully exchanged. The pre-shared key—the CKN and CAK—must match on both ends of a link

Default

No CAK exists, by default.

Options

hexadecimal-number The key name, in hexadecimal format.

For AES-128 the CAK key length is 32 hexadecimal characters, and for AES-256 it is 64. If you enter a key name with fewer characters than the standard (32 for cipher-suite gcm-aes-128, and 64 for cipher-suite gcm-aes-256), Junos will automatically fill in the remaining characters with zeros.

On MX10003 routers, to maximize the security, it is recommended to configure CAK of even length. If you configure the length of CAK to an odd value, you'll receive a warning message.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1.

Syntax

```
callback;
```

Hierarchy Level

```
[edit interfaces dln unit logical-unit-number dialer-options incoming-map],
[edit logical-systems logical-system-name interfaces dln unit logical-unit-number dialer-options
incoming-map]
```

Description

On J Series Services Routers with interfaces configured for ISDN, configure the dialer to terminate the incoming call and call back the originator after the callback wait period. The default wait time is 5 seconds. To configure the wait time, include the `callback-wait-period` statement at the `[edit interfaces dl n unit logical-unit-number dialer-options]` hierarchy level.

NOTE: The `incoming-map` statement is mandatory for the router to accept any incoming ISDN calls.

If the `callback` statement is configured, you cannot use the `caller caller-id` statement at the `[edit interfaces dln unit logical-unit-number dialer-options]` hierarchy level.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 7.5.

callback-wait-period | 3183

callback-wait-period

IN THIS SECTION

- Syntax | 3183
- Hierarchy Level | 3184
- Description | 3184
- Options | 3184
- Required Privilege Level | 3184
- Release Information | 3184

Syntax

```
callback-wait-period time;
```

Hierarchy Level

```
[edit interfaces dln unit logical-unit-number dialer-options],
[edit logical-systems logical-system-name interfaces dln unit logical-unit-number dialer-options]
```

Description

On J Series Services Routers with interfaces configured for ISDN with callback, specify the amount of time the dialer waits before calling back the caller. The default wait time is 5 seconds. The wait time is necessary because, when a call is rejected, the switch waits for up to 4 seconds on point-to-multipoint connections to ensure no other device accepts the call before sending the DISCONNECT message to the originator of the call. However, the default time of 5 seconds may not be sufficient for different switches or may not be needed on point-to-point connections.

To configure callback mode, include the `callback` statement at the [`edit interfaces dl`*n* `unit` *logical-unit-number* `dialer-options`] hierarchy level.

If the `callback` statement is configured, you cannot use the `caller` *caller-id* statement at the [`edit interfaces dl`*n* `unit` *logical-unit-number* `dialer-options`] hierarchy level.

Options

time—Time the dialer waits before calling back the caller.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 7.5.

- Options | 3188
- Required Privilege Level | 3189
- Release Information | 3189

Syntax

```
caller (caller-id | accept-all);
```

Hierarchy Level

```
[edit interfaces dln unit logical-unit-number dialer-options incoming-map],
[edit logical-systems logical-system-name interfaces dln unit logical-unit-number dialer-options
incoming-map]
```

Description

On J Series Services Routers with interfaces configured for ISDN, specify the dialer to accept a specified caller number or accept all incoming calls.

Options

caller-id—Incoming caller number. You can configure multiple caller IDs on a dialer. The caller ID of the incoming call is matched against all caller IDs configured on all dialers. The dialer matching the caller ID is looked at for further processing. Only a precise match is a valid match, For example, the configured caller ID 1-222-333-4444 or 222-333-4444 will match the incoming caller ID 1-222-333-4444.

If the incoming caller ID has fewer digits than the number configured, it is not a valid match. Duplicate caller IDs are not allowed on different dialers; however, for example, the numbers 1-408-532-1091, 408-532-1091, and 532-1091 can still be configured on different dialers.

Only one B-channel can map to one dialer. If one dialer is already mapped, any other call mapping to the same dialer is rejected (except in the case of a multilink dialer). If no dialer caller is configured on a dialer, that dialer will not accept any calls.

`accept-all`—Any incoming call in an associated interface is accepted.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 7.5.

calling-number (L2TP Tunnel Switching)

IN THIS SECTION

- Syntax | 3191
- Hierarchy Level | 3191
- Description | 3191

- Options | 3191
- Required Privilege Level | 3191
- Release Information | 3192

Syntax

```
calling-number action;
```

Hierarchy Level

```
[edit access tunnel-switch-profile profile-name avp]
```

Description

Specify the action taken on the Calling Number AVP (22) in the L2TP packets during tunnel switching if the AVP is negotiated when the first session is created.

Options

action—One of the following actions:

- `drop`—Drop the AVP.
- `regenerate`—Regenerate the AVP based on the local policy at the LTS and send it in the switched packet. The local policy may or may not use the value for the AVP received during negotiation for the first session.
- `relay`—Forward the AVP transparently as is and send it in the switched packet.
- **Default:** `relay`

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2.

calling-station-id

IN THIS SECTION

- Syntax | 3192
- Hierarchy Level | 3192
- Description | 3193
- Required Privilege Level | 3193
- Release Information | 3193

Syntax

```
calling-station-id {
    equals value;
    matches value;
}
```

Hierarchy Level

```
[edit unified-edge gateways tdf gateway-name domain-selection term term-name from]
```

Description

Specify the RADIUS AVP calling station ID for the incoming RADIUS request from the IP-based subscriber.

After this criterion and the other match criteria specified for the TDF domain or PCEF profile selection term are matched, the specified TDF domain or PCEF profile is selected.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

unified-edge—To view this statement in the configuration.

unified-edge-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.1.

calling-station-id-format (Subscriber Management)

IN THIS SECTION

- Syntax | 3194
- Hierarchy Level | 3194
- Description | 3194
- Default | 3194

- Options | 3194
- Required Privilege Level | 3195
- Release Information | 3195

Syntax

```
calling-station-id-format {
    agent-circuit-id;
    agent-remote-id;
    interface-description;
    interface-text-description;
    mac-address;
    nas-identifier;
    stacked-vlan;
    vlan;
}
```

Hierarchy Level

```
[edit access profile profile-name radius options]
```

Description

Specify the information that the router includes in the Calling-Station-ID (RADIUS IETF attribute 31) that is passed to the RADIUS server during authentication and accounting. You can include one or more optional values in any combination.

Default

The router displays the Calling-Station-ID set by the client.

Options

`agent-circuit-id`—Include the agent circuit identifier (ACI) string, which uniquely identifies the subscriber's access node and the digital subscriber line (DSL) on the access node. The ACI string is stored in either

the DHCP option 82 field of DHCP messages (for DHCP traffic), or in the DSL Forum Agent-Circuit-ID VSA [26-1] of PPPoE PADI and PADR control packets (for PPPoE traffic).

`agent-remote-id`—Include the agent remote identifier (ARI) string, which identifies the subscriber on the digital subscriber line access multiplexer (DSLAM) interface that initiated the service request. The ARI string is stored in either the DHCP option 82 field of DHCP messages (for DHCP traffic), or in the DSL Forum Agent-Remote-ID VSA [26-2] of PPPoE PADI and PADR control packets (for PPPoE traffic).

`interface-description`—Include the interface description value.

`interface-text-description`—Include the interface text description.

`mac-address`—Include the MAC address of the source device for the subscriber.

`nas-identifier`—Include the NAS-identifier (RADIUS IETF attribute 32), which specifies the name of the NAS that orginated the authentication or accounting request.

`stacked-vlan`—Include the stacked VLAN tag value.

`vlan`—Include the VLAN tag value.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.1.

`mac-address`, `interface-text-description`, `stacked-vlan`, and `vlan` options added in Junos OS Release 15.1.

        user-keepalive minutes;
    }
    secure-authentication (http | https);
}
```

Hierarchy Level

```
[edit services]
```

Description

Configure captive portal to authenticate clients connected to the switch for access to the network.

Default

Captive portal is disabled.

Options

authentication-profile-name *access-profile-name*

Specify the name of the access profile to be used for captive portal authentication. You configure the access profile at the [edit access profile] hierarchy level. The access profile contains the RADIUS server IP address and other information used for authentication.

- **Default:** No access profile is specified.

secure-authentication (http | https)

Enable HTTP or HTTPS access on the captive portal interface.

- **Default:** http
- **Values:** Specify one of the following:
  - http—Enables HTTP access on the captive portal interface.
  - https—Enables HTTPS access on the captive portal interface. HTTPS is recommended.

capture-file (Security)

IN THIS SECTION

- Syntax | 3206
- Hierarchy Level | 3207
- Description | 3207
- Options | 3207
- Required Privilege Level | 3207
- Release Information | 3208

Syntax

```
capture-file {
    filename;
    files number;
    format pacp-format;
    size maximum-file-size;
```

```
    (world-readable | no-world-readable);
}
```

Hierarchy Level

```
[edit security datapath-debug]
```

Description

Sets packet capture for performing the datapath-debug action.

Options

- *filename*—Name of the file to receive the output of the packet capturing operation.
- `files`—Maximum number of capture files.

  If you specify a maximum number of files, you also must specify a maximum file size with the `size` option and a filename.

  Range: 1 through 10 files
- `format`—Describes the format of the capture file. The default format file is pcap. You can also set it as private (binary) format.
- `size`—Describes the size limit of the capture file.

  If you specify a maximum file size, you also must specify a maximum number of trace files with the `files` option and a filename.

  Range: 10 KB through 100 MB
- `world-readable` | `no-world-readable`—By default, log files can be accessed only by the user who configures the tracing operation. The `world-readable` option enables any user to read the file. To explicitly set the default behavior, use the `no-world-readable` option.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

}
```

Hierarchy Level

```
[edit security]
```

Description

Configure Cloud Access Security Broker (CASB).

CASB provides visibility into the security of your cloud applications. To use CASB on your firewalls, you must configure CASB policies and apply CASB policy rules in a security policy.

Options

"instance " on page 8754*instance-name*	CASB instance name. Configure CASB instance with application, instance ID, domain, and type. Creating instances for SaaS applications ensures controlled access, data security, and differentiation between corporate and non-corporate usage.
"casb-policy" on page 3212*policy-name*	CASB policy name. Configure CASB policies to control specific actions on each cloud application.

default-policy ***policy-name***	The default CASB policy that defines the actions the device takes on a packet that does not match any user-defined policy. You must set up a default CASB policy for the unified policy configuration. This default policy applies to the session until a dynamic application match occurs. Once the final application match available for the security policy, the corresponding CASB policy will be applied. If no CASB policy is explicitly configured in the final firewall policy, the CASB service disengages for the session.
"traceoption" on page 29503	(Optional) Define tracing operations for CASB functionality.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 24.2R1.

cascade-ports

IN THIS SECTION

- Syntax | 3216
- Hierarchy Level | 3216
- Description | 3216
- Default | 3217
- Options | 3217
- Required Privilege Level | 3217
- Release Information | 3217

Syntax

```
cascade-ports interface-name;
```

Hierarchy Level

```
[edit chassis satellite-management fpc slot-id]
```

Description

Associate a cascade port with an FPC slot ID number in a Junos Fusion.

The FPC slot ID of the satellite device is determined by the value entered as the FPC *slot-id*. For instance, if the **set chassis satellite-management fpc 105 cascade-ports xe-0/0/1** statement is used to configure interface xe-0/0/1 into a cascade port, the satellite device that connects to interface xe-0/0/1 has an FPC slot ID of 105 in the Junos Fusion.

A Junos Fusion provides two methods of assigning an FPC identifier: Unique ID-based FPC identification and connectivity-based FPC identification. Unique ID-based FPC identification maps an FPC slot ID to a satellite device's MAC address or serial number, while connectivity-based FPC identification maps an FPC slot ID to a cascade port. This statement is used to assign an FPC ID using connectivity-based FPC identification by mapping an FPC slot ID to a cascade port.

In a Junos Fusion, each satellite device must be mapped to an FPC identifier (FPC ID). The FPC ID is used for Junos Fusion configuration, monitoring, and maintenance. Interface names—which are identified using the *type-fpc* / *pic* / *port* format—use the FPC ID as the *fpc* variable when the satellite device is participating in a Junos Fusion. For instance, built-in port 2—a Gigabit Ethernet interface on a satellite device that is using 101 as it's FPC ID— uses ge-101/0/2 as its interface name.

For additional information on the role of FPC slot IDs in a Junos Fusion, see *Understanding Junos Fusion Provider Edge Components* or Understanding Junos Fusion Enterprise Components.

Default

No FPC slot IDs are associated with satellite devices, by default.

Options

interface-name	Specifies the name of the interface.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

- Release Information | 3219

Syntax

```
cascade-ports interface-name;
```

Hierarchy Level

```
[edit chassis satellite-management cluster cluster-name]
```

Description

Associate a cascade port with a satellite device cluster in a Junos Fusion.

This command defines which cascade ports are associated with a satellite device cluster only. An interface still needs to be converted into a cascade port before it performs cascade port functions. There are multiple ways to convert an interface on the aggregation device into a cascade port. See *Configuring or Expanding a Junos Fusion Enterprise*.

Default

Cascade ports are not associated with satellite device clusters, by default.

Options

interface-name Specifies the name of the interface on the aggregation device that is associated with the satellite device cluster.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.1R1.

IN THIS SECTION

- Syntax | 3220
- Hierarchy Level | 3220
- Description | 3220
- Default | 3220
- Options | 3220
- Required Privilege Level | 3221
- Release Information | 3221

Syntax

```
categories {
    category;
}
```

Hierarchy Level

```
[edit snmp trap-group group-name]
```

Description

Define the types of traps that are sent to the targets of the named trap group.

Default

If you omit the `categories` statement, all trap types are included in trap notifications, except the `timing-events` category. You must explicitly configure generation of timing traps by including the `timing-events` statement at the [`edit snmp trap-group name`] hierarchy level for the timing traps to be included in the trap notifications.

Options

Categories

`authentication`	Authentication failures.
`chassis`	Chassis or environment notifications.
`chassis-cluster`	(For SRX Series) Clustering notifications.
`configuration`	Configuration notifications.
`link`	Link up-down transitions.
`otn-alarms`	OTN alarm trap subcategories.
`remote-operations`	Remote operations.
`rmon-alarm`	RMON rising and falling alarms.

`routing`	Routing protocol notifications.
`services`	Services notifications.
`sonet-alarms`	SONET alarm trap subcategories.
`startup`	System warm and cold starts.
`vrrp-events`	VRRP notifications.
`timing-events`	Timing notifications.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

category

IN THIS SECTION

- Syntax | 3222
- Hierarchy Level | 3222
- Description | 3222
- Options | 3222
- Required Privilege Level | 3222
- Release Information | 3223

Syntax

```
category category-name {
   inline-monitoring-instance inline-monitoring-instance;
}
```

Hierarchy Level

```
[edit chassis fpc slot-number pfe identifier exception-reporting]
```

Description

(Required) Configure the PFE exception category type and assign a particular inline-monitoring instance to it.

Options

category-name

Name of the category. Include more than one `category` statement in your configuration if you want reporting for more than one exception type (Junos OS only). You can specify one of the following types on each `category` statement:

- all—(Junos OS Evolved only) All exceptions
- firewall—(Junos OS only) Firewall exceptions
- forwarding-state—(Junos OS only) Forwarding-state-related exceptions
- layer2—(Junos OS only) Layer 2 exceptions
- layer3—(Junos OS only) Layer 3 exceptions
- packet-errors—(Junos OS only) Packet-format-error-related exceptions

inline-monitoring-instance *inline-monitoring-instance*

Assign a particular inline-monitoring instance to the exception reporting category.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 21.2R1 for MX Series routers.

Statement introduced in Junos Evolved OS Release 22.2R1 for PTX Series routers.

category (Security Dynamic Attack Group)

IN THIS SECTION

- Syntax | 3223
- Hierarchy Level | 3223
- Description | 3224
- Options | 3224
- Required Privilege Level | 3224
- Release Information | 3224

Syntax

```
category {
    values [category-value];
}
```

Hierarchy Level

```
[edit security idp dynamic-attack-group dynamic-attack-group-name filters]
```

Description

Specify a category filter to add attack objects based on the category.

Options

`values`—Name of the category filter. You can configure multiple filters separated by spaces and enclosed in square brackets.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.3.

category (Security Logging)

IN THIS SECTION

- Syntax | 3224
- Hierarchy Level | 3225
- Description | 3225
- Options | 3225
- Required Privilege Level | 3226
- Release Information | 3226

Syntax

```
category (all | content-security | fw-auth | screen | alg | nat | flow | sctp | gtp | ipsec |
idp | rtlog | pst-ds-lite | appqos | secintel | aamw | dnsf)
```

Hierarchy Level

```
[edit security log stream stream-name]
[edit logical-systems name security log stream stream-name]
[edit tenants tenant-name security log stream stream-name]
```

Description

Set the category of logging to `all` or `content-security`. Note that for the WELF format, the category must be set to `content-security`.

Options

- `all`—All events are logged. By default, all the events listed in the `category` parameter are logged.
- `content-security`—Only content security events are logged.
- `fw-auth`—Firewall authentication events are logged.
- `screen`—Screen events are logged.
- `alg`—Application Layer Gateway (ALG) events are logged.
- `nat`—Network Address Translation (NAT) events are logged.
- `flow`—Flow events are logged.
- `sctp`—Stream Control Transmission Protocol (SCTP) events are logged.
- `gtp`—GPRS Tunneling Protocol (GTP) events are logged.
- `ipsec`—IPsec events are logged.
- `idp`—Intrusion Detection and Prevention (IDP) events are logged.
- `rtlog`—RTLOG system log events are logged.
- `pst-ds-lite`—PST dual-stack lite (DS-Lite) events are logged.
- `appqos`—Application quality of service (AppQoS) events are logged.
- `secintel`—Juniper Networks Security Intelligence (SecIntel) events are logged.
- `aamw`—Advanced-anti-malware (AAMW) events are logged.
- `dnsf`—DNS events are logged.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.0. Statement modified in Junos OS Release 15.1X49-D40.

The [edit `logical-systems` *name* security log stream *stream-name*] hierarchy level introduced in Junos OS Release 18.2R1.

The [edit `tenants` *tenant-name* security log stream *stream-name*] hierarchy levels introduced in Junos OS Release 18.3R1.

The dnsf category is introduced in Junos OS Release 20.4R1.

category (Security Web Filtering)

IN THIS SECTION

- Syntax | 3227
- Hierarchy Level | 3227
- Description | 3227
- Options | 3235
- Required Privilege Level | 3236
- Release Information | 3236

Syntax

```
category name{
    action  (block | log-and-permit | permit | quarantine);
    custom-message message-name;
}
```

Hierarchy Level

```
[edit security utm default-configuration]
[edit security utm feature-profile web-filtering surf-control-integrated profile profile-name]
[edit security utm feature-profile web-filtering juniper-enhanced profile profile-name]
```

Description

Select a custom URL category list you created (custom objects) for filtering against. The `custom-message` configuration option is used to notify the users when the URL is blocked or quarantined for each EWF category. You can customize the message with options such as user message or redirect URL. User messages indicate that website access has been blocked by an organization's access policy. Redirect URLs redirect a blocked or quarantined URL to any user-defined URL. Table 11 on page 3227 shows the list of categories predefined by Websense.

Starting with Junos OS Release 17.4R1, you can download and dynamically load new Enhanced Web Filtering (EWF) categories. The downloading and dynamic loading of the new EWF categories do not require a software upgrade. Websense occasionally releases new EWF categories. EWF classifies websites into categories according to host, URL, or IP address and performs filtering based on the categories.

NOTE: Existing configurations are not affected by the new categories but can be modified to make use of the new categories.

```

Description

For ATM encapsulation only, define a constant bit rate bandwidth utilization in the traffic-shaping profile.

Default

Unspecified bit rate (UBR); that is, bandwidth utilization is unlimited.

Options

rate Peak rate, in bits per second (bps) or cells per second (cps). You can specify a value in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation `k` (1000), `m` (1,000,000), or `g` (1,000,000,000). You can also specify a value in cells per second by entering a decimal number followed by the abbreviation `c`; values expressed in cells per second are converted to bits per second by means of the formula 1 cps = 384 bps.

For ATM1 and ATM2 OC3 interfaces, the maximum available rate is 100 percent of *line-rate*, or 135,600,000 bps. For ATM1 OC12 interfaces, the maximum available rate is 50 percent of *line-rate*, or 271,263,396 bps. For ATM2 IQ interfaces, the maximum available rate is 542,526,792 bps.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

cell-mode (Dynamic Traffic Shaping)

IN THIS SECTION

- Syntax | 3246
- Hierarchy Level | 3246
- Description | 3246
- Options | 3246
- Required Privilege Level | 3247
- Release Information | 3247

Syntax

```
cell-mode (bytes bytes | $junos-cos-byte-adjust | cell-mode-bytes cell-mode-bytes |$junos-cos-
byte-adjust-cell);
```

Hierarchy Level

```
[edit dynamic-profiles profile-name class-of-service traffic-control-profiles profile-name overhead-
accounting],
[edit class-of-service traffic-control-profiles profile-name overhead-accounting],
```

Description

Configure the mode to shape downstream ATM traffic as cells.

Options

bytes	Byte adjustment value for the `cell-mode` or `frame-mode` shaping options.
$junos-cos-byte-adjust	Predefined variable for byte adjustment that is replaced with a value obtained from the RADIUS server when a subscriber authenticates over the interface to which the dynamic profile is attached.
cell-mode-bytes *cell-mode-bytes*	Shaping is based on the number of bytes in cells, and accounts for the ATM cell encapsulation and padding overhead. The resulting traffic stream conforms to the policing rates configured in downstream ATM switches, reducing the number of packet drops in the Ethernet network.
$junos-cos-byte-adjust-cell	Predefined variable for the cell mode shaping. This variable can not be used when the `overhead-accounting bytes` *bytes* option is configured.

BEST PRACTICE: We recommend using the `cell-mode-bytes` *cell-mode-bytes* option rather than the `bytes` option.

- **Range:** –120 through 124 bytes

> **NOTE**: If you specify a value for the `bytes` *`bytes`* option, you cannot specify a value for either the `cell-mode-bytes` option.

> **NOTE**: Cell mode is supported only on logical interfaces and interface sets; it is not supported on physical interfaces (ifd or ifd-remaining).

- **Default:** The default is `frame-mode`.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.2.

Variable *`$junos-cos-byte-adjust-cell`* introduced in Junos OS Release 13.1.
