Statement introduced before Junos OS Release 7.4.

RELATED DOCUMENTATION

Configuring a Text Description for LSPs

description (Routing Instances)

IN THIS SECTION

- Syntax | 5346
- Hierarchy Level | 5347
- Description | 5347
- Required Privilege Level | 5347
- Release Information | 5347

Syntax

```
description text;
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-instances routing-instance-name],
[edit routing-instances routing-instance-name]
```

Description

Provide a text description for the routing instance. If the text includes one or more spaces, enclose it in quotation marks (" "). Any descriptive text you include is displayed in the output of the `show route instance detail` command and has no effect on the operation of the routing instance.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

description (Security Address Book)

IN THIS SECTION

- Syntax | 5348
- Hierarchy Level | 5348
- Description | 5348
- Options | 5348
- Required Privilege Level | 5348
- Release Information | 5348

Syntax

```
description text;
```

Hierarchy Level

```
[edit security address-book book-name]
```

Description

Specify descriptive text for an address book.

NOTE: The descriptive text should not include characters “<”, “>”, “&”, or “\n”.

Options

text—Descriptive text about an address book.

- **Range:** 1 through 900 characters

NOTE: The upper limit of the description text range is related to character encoding, and is therefore dynamic. However, if you configure the descriptive text length beyond 900 characters, the configuration might fail to take effect.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1.

designated-forwarder-election-hold-time

IN THIS SECTION

- Syntax | 5363
- Hierarchy Level | 5363
- Description | 5363
- Options | 5364
- Required Privilege Level | 5364
- Release Information | 5364

Syntax

```
designated-forwarder-election-hold-time seconds;
```

Hierarchy Level

```
[edit protocols evpn],
[edit routing-instances protocols evpn]
```

Description

Set the time that the device waits before electing a designated forwarder (DF).

Customer edge (CE) devices require a DF when they are multihomed to more than one provider edge (PE) device. Without a designated forwarder, multihomed hosts would receive duplicate packets. The connections between a multihomed CE device and its multihoming peer PE devices form an Ethernet segment identified by an Ethernet segment identifier (ESI). The multihomed peer devices choose DFs for an ESI based on EVPN Type 4 route advertisements. EVPN Type 4 routes are called Ethernet segment routes.

Options

seconds Time in seconds that a multihomed CE device waits before electing a DF based on the EVPN Type 4 routes it receives.

- **Range:** 1 through 1800

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.1X53-D15.

destination

IN THIS SECTION

- Syntax | 5365
- Hierarchy Level | 5365
- Description | 5365
- Options | 5365
- Required Privilege Level | 5365
- Release Information | 5366

Syntax

```
destination {
    address address;
}
```

Hierarchy Level

```
[edit interfaces fti number unit logical-unit-number tunnel encapsulation ( gre | ipip | udp )]
```

Description

Interface address prefix of the destination where the tunnel terminates. Configuring this interface is mandatory.

> **NOTE**: Starting in Junos OS Evolved Release 20.3R1, for GRE tunnels, configure the address for the tunnel encapsulation destination address.
>
> When you do not configure "tunnel-termination" on page 30245, you can use `destination address address` to configure the destination IP address in the outer IP header while encapsulating the packet.

Options

address You can configure the destination address with an optional destination mask. The mask range is from 0 to 32 for IPv4, and 0 to 128 for IPv6 addresses. /32 is the default mask for IPv4, and /128 is the default mask for IPv6.

> **NOTE**: Starting in Junos OS Evolved Release 20.3R1, for GRE tunnels, if you do not configure "tunnel-termination" on page 30245 for tunnel decapsulation, you cannot configure the mask for the destination address.

Required Privilege Level

- Description | 5371
- Required Privilege Level | 5371
- Release Information | 5372

Syntax

```
destination-address address;
```

Hierarchy Level

```
[edit firewall family family-name filter filter-name term term-name from],
[edit firewall family family-name filter filter-name term term-name from ip-version ip-version]
```

Description

IP destination address field, which is the address of the destination node for the packet. You cannot specify the `destination-address` and `address` match conditions in the same term.

For IPv4, the `destination-address` field is 32 bits in length. The filter description syntax supports either a mask value that can be noncontiguous, such as 10.0.0.10/255.0.0.255, or prefix notation such as 10.0.0.0/8. Simple filters do not support noncontiguous mask values.

For IPv6, the `destination-address` field is 128 bits in length. The filter description syntax supports the text representations for IPv6 addresses that are described in RFC 2373, *IP Version 6 Addressing Architecture*.

Required Privilege Level

firewall—To view this statement in the configuration.

firewall-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.1R1.

destination-address (Flow Monitoring Logs for NAT)

IN THIS SECTION

- Syntax | 5374
- Hierarchy Level | 5374
- Description | 5374
- Options | 5374
- Required Privilege Level | 5374
- Release Information | 5374

Syntax

```
destination-address address;
```

Hierarchy Level

```
[edit services jflow-log collector collector-name]
```

Description

Specify the destination IP address or identifier of the host or external device that functions as the collector for receiving the generated flow monitoring logs that are sent from the exporter. You can configure an IPv4 address, or an identifier of the host system (the workstation either running the Jflow utility or collecting traffic flows using version 9 or IPFIX format). For external NetFlow collectors or servers, the hostname must be reachable from the same routing instance to which the initial data packet (that triggered session establishment) is delivered. You can specify a maximum of eight collectors per profile.

Options

address—Destination hostname, or IPv4 or IPv6 address of the collector.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1.

destination-address (HTTP Header Enrichment)

IN THIS SECTION

- Syntax | 5375
- Hierarchy Level | 5375
- Description | 5375
- Options | 5376
- Required Privilege Level | 5376
- Release Information | 5376

Syntax

```
destination-address {
    (any-ipv4 | any-ipv4 except);
    (any-ipv6 | any-ipv6 except);
    (any-unicast | any-unicast except);
    (prefix | prefix except);
}
```

Hierarchy Level

```
[edit services hcm tag-rule rule-name term term-number from]
```

Description

Specify the prefix or address type that the HTTP request destination IP address must match. You can specify multiple prefixes or address types by including the `destination-address` statement multiple times.

After this criterion and the other match criteria specified for the `term` are matched, the HTTP header enrichment actions specified for the `term` are applied to the HTTP traffic.

Options

any-ipv4 Match any IPv4 address.

any-ipv4 except Exclude IPv4 addresses from addresses that are in a `destination-address`, `destination-address-range`, or `destination-prefix-list` statement configured at the `[edit services hcm tag-rule` *`rule-name`* `term` *`term-number`* `from]` hierarchy level. You cannot use `except` without also configuring addresses that do match.

any-ipv6 Match any IPv6 address.

any-ipv6 except Exclude IPv6 addresses from addresses that are in a `destination-address`, `destination-address-range`, or `destination-prefix-list` statement configured at the `[edit services hcm tag-rule` *`rule-name`* `term` *`term-number`* `from]` hierarchy level. You cannot use `except` without also configuring addresses that do match.

any-unicast Match any IPv4 unicast address. This option does not match any IPv6 addresses.

any-unicast except Exclude IPv4 unicast addresses from addresses that are in a `destination-address`, `destination-address-range`, or `destination-prefix-list` statement configured at the `[edit services hcm tag-rule` *`rule-name`* `term` *`term-number`* `from]` hierarchy level. You cannot use `except` without also configuring IPv4 addresses that do match.

prefix IP prefix for the addresses that are matched.

***prefix* except** Exclude the specified IP prefixes from addresses that are in a `destination-address`, `destination-address-range`, or `destination-prefix-list` statement configured at the `[edit services hcm tag-rule` *`rule-name`* `term` *`term-number`* `from]` hierarchy level. You cannot use `except` without also configuring addresses that do match.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.1.

Syntax

```
destination-address-name <address-name>;
```

Hierarchy Level

```
[edit security nat static rule-set rule-set-name rule rule-name match]
```

Description

Specify a destination address name to match the rule.

Options

destination-address-name—Name of the destination address.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement modified in Junos OS Release 9.6.

destination-address (NAT Next Gen Services)

IN THIS SECTION

- Syntax | 5383
- Hierarchy Level | 5383
- Description | 5383
- Options | 5383
- Required Privilege Level | 5384
- Release Information | 5384

Syntax

```
destination-address (address | any | any-ipv4 | any-ipv6);
```

Hierarchy Level

```
[edit services nat destination rule-set rule-set rule rule-name match],
[edit services nat source rule-set rule-set rule rule-name match]
```

Description

Specify the destination address that the packet must match for the NAT rule to take effect.

Options

address A specific address that must be matched.

any	Any unicast destination address results in a match.
any-ipv4	Any IPv4 destination address results in a match.
any-ipv6	Any IPv6 destination address results in a match.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 19.3R2.

destination-address (PCP)

IN THIS SECTION

- Syntax | 5384
- Hierarchy Level | 5385
- Description | 5385
- Options | 5385
- Required Privilege Level | 5385
- Release Information | 5385

Syntax

```
destination-address address <except>;
```

Hierarchy Level

```
[edit services pcp rule rule-name term term-name from]
```

Description

Specify the destination address that must be matched for the PCP rule. A PCP rule assigns the PCP server that handles selected traffic.

PCP is supported on the MS-DPC, MS-100, MS-400, and MS-500 MultiServices PICS. Starting in Junos OS Release 17.4R1, PCP is also supported on the MS-MPC and MS-MIC.

Options

address	Destination address or prefix value.
minimum-value	Lower boundary for the address range.
except	(Optional) Prevent the specified address range from matching the PCP rule.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2R1.

- Release Information | 5388

Syntax

```
destination-address-range {
    high address low address <except>;
}
```

Hierarchy Level

```
[edit services hcm tag-rule rule-name term term-number from]
```

Description

Specify an IP address range that the HTTP request destination IP address must match. You can specify multiple address ranges by including the `destination-address-range` statement multiple times.

After this criterion and the other match criteria specified for the `term` are matched, the HTTP header enrichment actions specified for the `term` are applied to the HTTP traffic.

Options

except (Optional) Exclude addresses in the specified address range from addresses that are in a `destination-address`, `destination-address-range`, or `destination-prefix-list` statement configured at the [`edit services hcm tag-rule` *`rule-name`* `term` *`term-number`* `from`] hierarchy level. You cannot use `except` without also configuring addresses that do match.

high *address* Upper limit of the address range.

low *address* Lower limit of the address range.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.1.

Security Policies Overview

destination-address (Security Policies Flag)

IN THIS SECTION

- Syntax | 5399
- Hierarchy Level | 5399
- Description | 5399
- Options | 5400
- Required Privilege Level | 5400
- Release Information | 5400

Syntax

```
destination-address {
    drop-translated;
    drop-untranslated;
}
```

Hierarchy Level

```
[edit security policies from-zone zone-name to-zone zone-name policy policy-name then permit]
```

Description

Specify whether the traffic permitted by the security policy is limited to packets where the destination IP address has been translated by means of a destination NAT rule or to packets where the destination IP address has not been translated.

On Juniper Networks security devices, destination NAT rules are processed before security policy lookup. Therefore, it is possible for a security policy to permit traffic from a source `S` to a destination `D` (where no destination NAT is performed) and also to permit traffic from the source `S` to the destination `d` (where `d` has been translated to `D`).

Options

- `drop-translated`—Drop packets with translated destination IP addresses. Traffic permitted by the security policy is limited to packets where the destination IP address has not been translated.
- `drop-untranslated`—Drop packets without translated destination IP addresses. Traffic permitted by the security policy is limited to packets where the destination IP address has been translated by means of a destination NAT rule.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.2.

Specify a destination IP address or IP address set object to specify all destination address objects except the specified address objects. The default value is any.

Options

address-name—IP address or IP address set object.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.2.

destination-header

IN THIS SECTION

- Syntax | 5419
- Hierarchy Level | 5420
- Description | 5420
- Options | 5420
- Required Privilege Level | 5420
- Release Information | 5420

Syntax

```
destination-header {
    ILNP-nonce-option;
    home-address-option;
    line-identification-option;
    tunnel-encapsulation-limit-option;
    user-defined-option-type low | <to high>;
}
```

Hierarchy Level

```
[edit security screen ids-option screen-name ip ipv6-extension-header]
```

Description

Define the IPv6 destination header screen option.

Options

ILNP-nonce-option	Enable the Identifier-Locator Network Protocol nonce screen option.
home-address-option	Enable the home address screen option.
line-identification-option	Enable the line identification screen option.
tunnel-encapsulation-limit-option	Enable the tunnel encapsulation limit screen option.
user-defined-header-type *low* **| <to** *high***>**	Define the type of header range. • **Range:** 1 through 255.

Required Privilege Level

security—To view this in the configuration.

security-control—To add this to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1X46-D10.

tunnel | 30190

destination-identity-context

IN THIS SECTION

- Syntax | 5428
- Hierarchy Level | 5428
- Description | 5428
- Options | 5428
- Required Privilege Level | 5429
- Release Information | 5429

Syntax

```
destination-identity-context {
      [user-or-role-name];
      any;
      identity-context-authenticated;
      identity-context-unauthenticated;
      identity-context-unavailable;
}
```

Hierarchy Level

```
[edit security policies from-zone zone-name to-zone zone-name policy policy-name]
```

Description

Identifies users and roles to be used as match criteria for a policy. If a value other than `any` is specified as match criteria for a policy within a zone pair, the traffic is matched to table entries to retrieve associated user and roles before policy lookup occurs. Users and roles are retrieved from the local authentication table or from a UIT pushed to the SRX Series firewall from an access control service when a user is authenticated.

We recommend that you don't configure captive portal, when you use `destination-identity-context` with `identity-context-unauthenticated` option.

Options

The following entries specify the destination identities that match a policy:

user-or-role-name A list of specific users and roles.

- Range: 0 through 39 characters.

  SRX Series firewall truncate imported roles to 39 characters. You need to ensure that all of your roles are 39 characters or less.

any Any user or role, as well as the keywords identity-context-authenticated, identity-context-unauthenticated, and identity-context-unavailable.

identity-context-authenticated All users and roles that have been authenticated.

identity-context-unauthenticated Any user or role that does not have an IP-address mapped to authentication destination and the authentication destination is up and running.

identity-context-unavailable Any user or role that does not have an IP address mapped to authentication destination, because the authentication destination is disconnected from the SRX Series firewall. In this case, users are unable to be authenticated due to an authentication server disconnection, such as a power outage.

Unavailable user must be configured for non-domain users to be able to authenticate and log in.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 23.4R1.

destination-identity-context-profile

IN THIS SECTION

- Syntax | 5430
- Hierarchy Level | 5430
- Description | 5430
- Options | 5430
- Required Privilege Level | 5430
- Release Information | 5430

Syntax

```
destination-identity-context-profile device-identity-profile-name;
```

Hierarchy Level

```
[edit security policies from-zone zone-name to-zone zone-name policy policy-name]
```

Description

The `destination-identity-context-profile` field in a security policy enables you to specify a device identity profile. The device identity feature allows you to use the identity of a device and its attributes to control access to network resources instead of the identity of the user of that device.

Options

device-identity-profile-name	Device identity profile that specifies characteristics that can apply to one or more devices.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 23.4R1.

destination-interface

IN THIS SECTION

Syntax | 5431

- Hierarchy Level | 5431
- Description | 5431
- Options | 5432
- Required Privilege Level | 5432
- Release Information | 5432

Syntax

```
destination-interface interface-name;
```

Hierarchy Level

```
[edit services rpm probe owner test test-name],
[edit services rpm probe-server (tcp | udp)],
[edit services rpm twamp client control-connection control-client-name]
```

Description

On M Series and T Series routers, specify a services (sp-) interface that adds a timestamp to RPM probe messages. This feature is supported only with icmp-ping, icmp-ping-timestamp, udp-ping, and udp-ping-timestamp probe types. You must also configure the rpm statement on the sp- interface and include the unit 0 family inet statement with a /32 address.

On M Series, MX Series, and T Series routers, specify a multiservices (ms-) interface that adds a timestamp to RPM probe messages. This feature is supported only with icmp-ping, icmp-ping-timestamp, udp-ping, and udp-ping-timestamp probe types. You must also configure the rpm statement on the ms- interface and include the unit 0 family inet statement with a /32 address.

The inline service interface (si- interface) is a virtual physical service interface that resides on the Packet Forwarding Engine to provide L2TP services without a special services PIC. The inline service interface is supported only by MPCs on MX Series routers. Four inline service interfaces are configurable per MPC-occupied chassis slot. Specify a multiservices (si-) interface that adds a timestamp to TWAMP probe messages. You must also configure the rpm twamp-client or twamp-server statement on the si- interface and include the unit 0 family inet statement with a /32 address.

To enable RPM for the extension-provider packages on the adaptive services interface, configure the `object-cache-size`, `policy-db-size`, and `package` statements at the [`edit chassis fpc` *`slot-number`* `pic` *`pic-number`* `adaptive-services service-package extension-provider`] hierarchy level. For the extension-provider package, *`package-name`* in the `package` *`package-name`* statement is `jservices-rpm`.

Starting in Junos OS Release 17.3R1, you can use `destination-interface` *`interface-name.logical-unit-number`* at the [`edit services rpm probe` *`owner`* `test` *`test-name`*] hierarchy level to configure the generation of probes on an MS-MPC or MS-MIC. You must also inlcude the `delegate-probes` statement at the [`edit services rpm probe` *`owner`*] hierarchy level and the `rpm client-delegate-probes` and the `family (inet | inet6) address` *`address`* statements at the [`edit interfaces` *`interface-name`* `unit` *`logical-unit-number`*] hierarchy level.

Options

`interface-name`—Name of the adaptive services interface.

Required Privilege Level

system—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 7.5.

Support at the [`edit services rpm twamp client control-connection` *`control-client-name`*] hierarchy level introduced in Junos OS Release 15.1 for MX Series routers.

destination-option

IN THIS SECTION

- Syntax | 5453
- Hierarchy Level | 5453
- Description | 5453
- Required Privilege Level | 5453
- Release Information | 5453

Syntax

```
destination-option {
    home-address {
        match (equal | greater-than | less-than | not-equal);
        value header-value;
    }
    option-type {
        match (equal | greater-than | less-than | not-equal);
        value header-value;
    }
}
```

Hierarchy Level

```
[edit  set security idp custom-attack attack-name attack-type signature protocol ipv6 extension-
header]
```

Description

Specify the IPv6 destination option for the extension header. The `destination-option` option inspects the header option type of `home-address` field in the `extension header` and reports a custom attack if a match is found. The `destination-option` supports the `home-address` field type of inspection.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3X48-D30.

destination-override

IN THIS SECTION

- Syntax | 5454
- Hierarchy Level | 5454
- Description | 5454
- Options | 5454
- Required Privilege Level | 5455
- Release Information | 5455

Syntax

```
destination-override {
    syslog host ip-address;
}
```

Hierarchy Level

```
[edit system tracing]
```

Description

This option overrides the system-wide configuration under `[edit system tracing]` and has no effect if system tracing is not configured.

Options

These options specify the system logs and the host to which remote tracing output is sent:

- `syslog`—Specify the system process log files to send to the remote tracing host.
- `host` *`ip-address`*—Specify the IP address to which to send tracing information.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.2.

destination-path-group

IN THIS SECTION

- Syntax | 5455
- Hierarchy Level | 5456
- Description | 5456
- Options | 5456
- Required Privilege Level | 5457
- Release Information | 5457

Syntax

```
destination-path-group group-name {
    active-probe-properties {
         active-probe-only ;
    }
    inline-gre-encap
    overlay-path {
```

```
        overlay-path-name;
    }
    probe-routing-instance {
        routing-instance-name;
    }
}
```

Hierarchy Level

[edit security advance-policy-based-routing]

Description

Define a group containing multiple overlay paths terminating at a same destination.

In releases prior to Junos OS release 20.2R1, AppQoE determines the applicable destination path group and binds the application sessions to that particular destination-path-group. Based on the application's SLA requirements and link preferences, AppQoE determines the best link among all the links in that destination-path-group. All the instances of the applications use the same best path in the chosen DPG. If there is SLA violation on the current link, then AppQoE determines a new best-link only among all the links in the chosen destination-path-group. In the case of primary hub failover or routing change, AppQoE selects another DPG and then binds the session to the new destination-path-group.

Staring in Junos OS release 20.2R1, with support for the active-active deployment, you can select the links across the destination path groups if an end-point is reachable through them. The best link selected among all the links in the selected destination path group sends the application traffic.

Options

group-name	Name that identifies the destination path group.	
active-probe-properties	Specify additional active probe property.	
	active-probe-only	Enable active probing only to the destination path group
inline-gre-encap	Enable inline GRE encapsulation.	
overlay-path ***overlay-path-name***	Overlay path name.	
probe-routing-instance ***routing-instance-name***	Routing instance for the probe path.	

Required Privilege Level

services—To view this statement in the configuration.

services-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 18.2R1.

destination-port (RPM and TWAMP)

IN THIS SECTION

- Syntax | 5462
- Junos OS Hierarchy Levels | 5462
- Junos OS Evolved Hierarchy Level | 5462
- Description | 5462
- Options | 5463
- Required Privilege Level | 5463
- Release Information | 5463

Syntax

```
destination-port port;
```

Junos OS Hierarchy Levels

```
[edit services rpm bgp],
[edit services rpm probe owner test test-name],
[edit services rpm twamp client control-connection control-client-name]
[edit services rpm twamp client control-connection control-client-name test-session test-session-
name
```

Junos OS Evolved Hierarchy Level

```
[edit services monitoring rpm owner name test name]
```

Description

Specify the User Datagram Protocol (UDP) or Transmission Control Protocol (TCP) port to which a probe is sent. This statement is used only for TCP or UDP probe types.

The value for the `destination-port` can be only 7 when you configure the destination port along with hardware timestamping. A constraint check prevents you for configuring any other value for the destination port in this case.

This constraint does not apply when you are using one-way hardware timestamping along with `destination-port` and either `probe-type udp-ping` or `probe-type udp-ping-timestamp`.

For a managed TWAMP control connection (the default or configured with the `control-type managed` statement), the `destination-port` statement is required at the `[edit services rpm twamp control-connection control-connection-name]` hierarchy level (Junos OS) or the `[edit services monitoring twamp control-connection control-connection-name]` hierarchy level (Junos OS Evolved) and is not allowed at the individual test-session level, at `[edit services rpm twamp control-connection control-connection-name test-session test-session-name]` (Junos OS) or `[edit services monitoring twamp control-connection control-connection-name test-session test-session-name]` (Junos OS Evolved).

For a TWAMP control connection configuration that includes the `control-type light` statement, the `destination-port` statement is not allowed at the `[edit services rpm twamp control-connection control-connection-`

name] hierarchy level (Junos OS) or the [`edit services monitoring twamp control-connection` *control-connection-name*] hierarchy level (Junos OS Evolved), but is required for each test session, at [`edit services rpm twamp control-connection` *control-connection-name* `test-session` *test-session-name*] (Junos OS) or [`edit services monitoring twamp control-connection` *control-connection-name* `test-session` *test-session-name*] (Junos OS Evolved).

Options

port—Port number `7` or from `862` through `65,535`.

- **Default:** The default value for the port is 862 to which the TWAMP client establishes the control connection.

> **NOTE**: The specified port numbers are recommended for RPM only.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Statement introduced in Junos OS Release 9.3 for EX Series switches.

Statement introduced in Junos OS Release 13.2 for PTX Series Packet Transport Routers.

Support at the [`edit services rpm twamp client control-connection` *control-client-name*] hierarchy level introduced in Junos OS Release 15.1 for MX Series routers.

Statement introduced in Junos OS Evolved Release 20.1R1.

Support at the [`edit services rpm twamp client control-connection` *control-client-name* `test-session` *test-session-name*] hierarchy level for Junos OS Release 21.1R1.

- Release Information | 5491

Syntax

```
destination-port port-number;
```

Hierarchy Level

```
[edit services radius-flow-tap policy policy-name inet drop-policy rule-name from],
[edit services radius-flow-tap policy policy-name inet6 drop-policy rule-name from]
```

Description

Specify the destination IP address for the radius-flow-tap policy.

Options

port-number— Number of the IPv4 or IPv6 destination port for the radius-flow-tap policy.

Required Privilege Level

flow-tap—To view this statement in the configuration.

flow-tap-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3.

Configuring RADIUS-Initiated Subscriber Secure Policy Mirroring Overview

destination-ports (HTTP Header Enrichment)

IN THIS SECTION

- Syntax | 5491
- Hierarchy Level | 5492
- Description | 5492
- Options | 5492
- Required Privilege Level | 5492
- Release Information | 5492

Syntax

```
destination-ports value;
```

Hierarchy Level

```
[edit services hcm tag-rule rule-name term term-number from]
```

Description

Specify the HTTP request destination port number that must be matched. You can specify multiple ports by including the `destination-ports` statement multiple times.

After this criterion and the other match criteria specified for the `term` are matched, the HTTP header enrichment actions specified for the `term` are applied to the HTTP traffic.

Options

value—Port number.

- **Range:** 0 through 65,535

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.1.

destination-prefix (Destination NAT Next Gen Services)

IN THIS SECTION

- Syntax | 5493
- Hierarchy Level | 5493
- Description | 5493
- Required Privilege Level | 5493
- Release Information | 5493

Syntax

```
destination-prefix destination-prefix;
```

Hierarchy Level

```
[edit services nat destination rule-set rule-set rule rule-name then destination-nat]
```

Description

Specify the IPv6 prefix that is used to embed an IPv4 destination address in an IPv6 address. The `destination-prefix` statement is used in Stateful NAT64 and 464XLAT translations.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 19.3R2.

destination-prefix (IDS)

IN THIS SECTION

- Syntax | 5494
- Hierarchy Level | 5494
- Description | 5494
- Options | 5494
- Required Privilege Level | 5495
- Release Information | 5495

Syntax

```
destination-prefix prefix-value;
```

Hierarchy Level

```
[edit services ids rule rule-name term term-name then aggregation]
```

Description

Specify a prefix length for destination IPv4 address aggregation for the IDS rule. This applies session limits to an aggregation of all attacks to a subnet of the specified length.

For example, if you configure a value of 24 for `destination-prefix`, then attacks to 10.1.1.2 and 10.1.1.3 are counted as attacks to the 10.1.1/24 subnet.

Options

prefix-value—Integer value.

- **Range:** 1 through 32

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

- Release Information | 5496

Syntax

```
destination-prefix-ipv6 prefix;
```

Hierarchy Level

```
[edit services ids rule rule-name term term-name then aggregation]
```

Description

Specify a prefix length for destination IPv6 address aggregation for the IDS rule. This applies session limits to an aggregation of all attacks to a subnet of the specified length.

For example, if you configure a value of 64 for `destination-prefix-ipv6`, then attacks to 2001:db8:1234:72a2::2 and 2001:db8:1234:72a2::3 are counted as attacks to the 2001:db8:1234:72a2::/64 subnet.

Options

`prefix-value`—Integer value.

- **Range:** 1 through 128

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

destination-prefix-list (HTTP Header Enrichment)

IN THIS SECTION

- Syntax | 5497
- Hierarchy Level | 5497
- Description | 5497
- Options | 5497
- Required Privilege Level | 5498
- Release Information | 5498

Syntax

```
destination-prefix-list {
    (prefix-name | prefix-name except);
}
```

Hierarchy Level

```
[edit services hcm tag-rule rule-name term term-number from]
```

Description

Specify the destination prefix list that the HTTP request destination IP address must match. You can specify multiple prefix lists by including the `destination-prefix-list` statement multiple times.

After this criterion and the other match criteria specified for the `term` are matched, the HTTP header enrichment actions specified for the `term` are applied to the HTTP traffic.

Options

prefix-name	Name of the prefix list.

> **NOTE**: The prefix list must already be defined at the `[edit policy-options prefix-list]` hierarchy level.

***prefix-name* except**

Exclude addresses that are in the specified prefix list from addresses that are in the `destination-address` or `destination-address-range` statement configured at the `[edit services hcm tag-rule` *`rule-name`* `term` *`term-number`* `from]` hierarchy level. You cannot use `except` without also configuring addresses that do match.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.1.

destination-prefix-list (PCP)

IN THIS SECTION

- Syntax | **5499**
- Hierarchy Level | **5499**
- Description | **5499**
- Options | **5499**
- Required Privilege Level | **5499**
- Release Information | **5499**

Syntax

```
destination-prefix-list list-name;
```

Hierarchy Level

```
[edit services pcp rule rule-name term term-name from]
```

Description

Specify the destination prefix list that must be matched for the PCP rule. You configure the prefix list by including the `prefix-list` statement at the `[edit policy-options]` hierarchy level. A PCP rule assigns the PCP server that handles selected traffic.

PCP is supported on the MS-DPC, MS-100, MS-400, and MS-500 MultiServices PICS. Starting in Junos OS Release 17.4R1, PCP is also supported on the MS-MPC and MS-MIC.

Options

list-name Destination prefix list.

except (Optional) Prevent the specified prefix list from matching the PCP rule.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2R1.

destination (saegw system)

IN THIS SECTION

- Syntax | 5520
- Hierarchy Level | 5520
- Description | 5520
- Options | 5521
- Required Privilege Level | 5521
- Release Information | 5521

Syntax

```
destination {
    peer-address address;
    port port-number;
    routing-instance instance-name;
    source-address address;
}
```

Hierarchy Level

```
[edit services mobile-edge gateways saegw system]
```

Description

Configure the destination address of the IPsec peer or content of communication point of aggregation (CC-PAG) peer on the user plane for lawful intercept data. The control plane provides the address of the Mediation and Delivery Function (MDF), but it might not provide the address of the IPsec peer, which you need to configure. This configuration is applicable to both 4G and 5G.

NOTE: Currently, this configuration supports only IPv4 addresses.

If you configure the peer address, you must also configure the source address because you must define both endpoints of the IPsec tunnel. You can configure the routing instance independent of the source and peer address.

A change in the configuration takes effect only when the control plane deactivates and reactivates the lawful intercept task. Existing tasks maintain their original CLI-configured values.

Options

peer-address *address*	Address of the IPsec peer.
port *port-number*	TCP/UDP port number of the IPsec peer.
routing-instance *instance-name*	Name of the routing instance.
source-address *address*	Address of the user plane (SAEGW-U or UPF).

Required Privilege Level

system

Release Information

Statement introduced in Junos OS Release 9.3.

destination-threshold

IN THIS SECTION

- Syntax | 5525
- Hierarchy Level | 5525
- Description | 5526
- Options | 5526
- Required Privilege Level | 5526
- Release Information | 5526

Syntax

```
destination-threshold number;
```

Hierarchy Level

```
[edit security screen ids-option screen-name tcp syn-flood]
```

Description

Specify the number of SYN segments received per second for a single destination IP address before the device begins dropping connection requests to that destination. If a protected host runs multiple services, you might want to set a threshold based only on the destination IP address, regardless of the destination port number.

Options

number —Number of SYN segments received per second before the device begins dropping connection requests.

- **Range:** 4 through 1,000,000 per second
- **Default:** 4000 per second

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement modified in Junos OS Release 9.2.

detect-loc

IN THIS SECTION

- Syntax | 5538
- Hierarchy Level | 5538
- Description | 5538
- Default | 5539
- Required Privilege Level | 5539
- Release Information | 5539

Syntax

```
detect-loc;
```

Hierarchy Level

```
[edit protocols oam ethernet connectivity-fault-management maintenance-domain md-name maintenance-
association ma-name mep mep-id remote-mep mep-id ]
```

```
[edit protocols oam ethernet link-fault-management interface interface-name ]
```

Description

Specify whether Ethernet OAM continuity checks are performed for an individual remote maintenance end point (MEP).

When you configure the `detect-loc` statement at [`edit protocols oam ethernet link-fault-management interface` *`interface-name`*] hierarchy level, a loss-of-continuity (LOC) defect is raised when the peer is not found within a period that is equal to 3 times the current keepalive pdu interval. When an LOC defect is raised, a syslog error message is generated .

> **NOTE**: When you configure the `detect-loc` statement at the [`edit protocols oam ethernet link-fault-management interface` *`interface-name`*] hierarchy level, any `action-profile` configured to bring down the interface is executed when an LOC defect is detected. However, the `action-profile` is not executed if you have not configured `detect-loc` statement the `detect-loc` statement at the [`edit protocols oam ethernet link-fault-management interface` *`interface-name`*] hierarchy level.

To view the current LOC status of an interface, execute the `show oam ethernet link-fault-management` command.

Default

The MEP does not generate LOC defect messages by default.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.2.

detection (Network Isolation Groups)

IN THIS SECTION

- Syntax | 5540
- Hierarchy Level | 5540
- Description | 5541
- Options | 5541
- Required Privilege Level | 5541
- Release Information | 5541

Syntax

```
detection {
    hold-time (<down milliseconds> <up milliseconds>);
    link-tracking {
      failure-type link;
      interface name;
      minimum-links minimum-links;
    }
    service-tracking {
      core-isolation;
    }
}
```

Hierarchy Level

```
[edit logical-systems name protocols network-isolation group],
[edit protocols network-isolation group]
```

Description

Configure detection parameters in a network isolation group for an EVPN network. The device uses these parameters to detect network isolation condition changes. You also specify how long to delay before the device records and acts on a network isolation status change.

A network isolation condition means a bridge domain, VLAN, or EVPN instance (EVI) becomes isolated from the EVPN core network, usually for one or more of the following reasons:

- The associated interconnecting physical or logical links are down.
- The device doesn't have routes to the remote endpoints in the bridge domain, VLAN, or EVI.

You can configure either the `link-tracking` option or the `service-tracking` option in a particular network isolation group, and assign that group as a network isolation profile. You can't define link tracking and service tracking parameters in the same network isolation group.

Options

hold-time down ***milliseconds***

When evaluating the device has experienced a network isolation condition, the time the device waits in milliseconds before declaring the network is not reachable. Specify a value of 1 or more milliseconds.

This setting is supported only with the `link-tracking` option.

hold-time up ***milliseconds***

When evaluating if the device has recovered from a network isolation condition, the time the device waits in milliseconds before declaring the network is reachable and acting to bring up the associated interfaces. Specify a value of 1 or more milliseconds.

You usually want to set a hold time greater than 0 so the device isn't excessively processing rapid status changes.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS and Junos OS Evolved Release 23.1R1.

`service-tracking` option added in Junos OS and Junos OS Evolved Release 23.2R1.

detection-time (BFD for PIM)

IN THIS SECTION

- Syntax | 5544
- Hierarchy Level | 5544
- Description | 5544

Required Privilege Level | 5544
Release Information | 5545

Syntax

```
detection-time {
    threshold milliseconds;
}
```

Hierarchy Level

```
[edit protocols pim interface interface-name bfd-liveness-detection],
[edit routing-instances routing-instance-name protocols pim interface interface-name bfd-
liveness-detection]
```

Description

Enable BFD failure detection. The BFD failure detection timers are adaptive and can be adjusted to be faster or slower. The lower the BFD failure detection timer value, the faster the failure detection and vice versa. For example, the timers can adapt to a higher value if the adjacency fails (that is, the timer detects failures more slowly). Or a neighbor can negotiate a higher value for a timer than the configured value. The timers adapt to a higher value when a BFD session flap occurs more than three times in a span of 15 seconds. A back-off algorithm increases the receive (Rx) interval by two if the local BFD instance is the reason for the session flap. The transmission (Tx) interval is increased by two if the remote BFD instance is the reason for the session flap. You can use the `clear bfd adaptation` command to return BFD interval timers to their configured values. The `clear bfd adaptation` command is hitless, meaning that the command does not affect traffic flow on the routing device.

The remaining statement is explained separately. See CLI Explorer.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.2.

Support for BFD authentication introduced in Junos OS Release 9.6.

Description

Enable BFD failure detection. The BFD failure detection timers are adaptive and can be adjusted to be faster or slower. The lower the BFD failure detection timer value, the faster the failure detection and vice versa. For example, the timers can adapt to a higher value if the adjacency fails (that is, the timer detects failures more slowly). Or a neighbor can negotiate a higher value for a timer than the configured value. The timers adapt to a higher value when a BFD session flap occurs more than three times in a span of 15 seconds. A back-off algorithm increases the receive (Rx) interval by two if the local BFD instance is the reason for the session flap. The transmission (Tx) interval is increased by two if the remote BFD instance is the reason for the session flap. You can use the `clear bfd adaptation` command to return BFD interval timers to their configured values. The `clear bfd adaptation` command is hitless, meaning that the command does not affect traffic flow on the routing device.

Starting in Junos OS Release 20.3R1, we support distributed mode for BFD failure detection on the SRX5000 line of devices with SPC3 card. The distributed mode provides faster BFD failure detection of 300 (3 x 100) ms. You can enable distributed mode when you configure the BFD failure detection timer value less than 500 ms.

Starting in Junos OS Release 21.1R1, we support distributed mode for BFD on SRX1500, SRX4100, SRX4200, and SRX4600. This mode provides a faster BFD failure detection time of 3 x 300 ms.

For optimization and performance enhancement, you must configure the BFD failure detection timer value in multiples of 50 ms.

Starting in Junos OS Release 24.3R1, we've introduced distributed mode for BFD failure detection on vSRX 3.0. To enable distributed mode, configure the BFD failure detection time value as 500 ms. This feature is supported in stand-alone and L3-HA mode on vSRX 3.0.

With this support, we've also added the dedicated offload CPU feature on vSRX 3.0. The dedicated offload CPU feature reschedules a flow thread and uses the DPDK flow filters on the NIC to move high priority packets (BGP, RIPv2, OSPF, PIM, Multicast, IGMP, Single-Hop BFD, and Multihop BFD) onto the dedicated flow thread. With this feature, packets are processed by their own dedicated flow thread or queue, even in cases where the forwarding plane is oversubscribed and dropping packets.

To enable the dedicated offload CPU feature on vSRX 3.0, run the `set security forwarding-options dedicated-offload-cpu` command.

To view the Packet Forwarding Engine's current dedicated offload CPU status use the `show security forward-options dedicated-offload-cpu` command. This command displays whether the Packet Forwarding Engine has dedicated offload CPU feature enabled or disabled.

Options

threshold ***milliseconds***

Specify the threshold for the adaptation of the BFD session detection time. When the detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent.

> **NOTE**: The threshold value must be equal to or greater than the transmit interval.
>
> The threshold time must be equal to or greater than the value specified in the `minimum-interval` or the `minimum-receive-interval` statement.

- **Range:** 1 through 255,000 ms

Syntax

```
deterministic-ar-policy [ deterministic-ar-policy-name ... ];
```

Hierarchy Level

```
[edit routing-instances name protocols evpn assisted-replication leaf]
```

Description

Assign routing policies to an EVPN instance on an assisted replication (AR) leaf device to deterministically steer multicast flows to specific preferred AR replicator devices. With this feature, you can control how the leaf device load-balances multicast flows among the available AR replicator devices, rather than using the default load-balancing method on the device.

> **NOTE**: AR is a multicast traffic flow optimization feature where an ingress leaf device sends one copy of a multicast stream to another device called an AR replicator in the EVPN network. AR replicators are devices that can efficiently handle replicating and forwarding multicast streams to the other multicast receivers in the network. See *Assisted Replication Multicast Optimization in EVPN Networks* for details on how AR works and how to configure AR leaf and AR replicator devices.

We support setting deterministic AR replicator policies only in EVPN-VXLAN networks running AR with optimized intersubnet multicast (OISM).

You can define and assign AR replicator routing policies as follows:

- You can include match conditions for IPv4 or IPv6 multicast traffic with IGMP or MLD multicast groups.

  With IGMPv2 (IPv4) or MLDv1 (IPv6) multicast traffic, you can match a multicast flow for a multicast group and/or a bridge domain (a VLAN-mapped virtual network identifier [VNI]).

  With IGMPv3 (IPv4) or MLDv2 (IPv6 traffic), you can match a multicast flow for any combination of the following:

  - A multicast group
  - A bridge domain (a VLAN-mapped VNI)
  - A multicast source address, because these are source-specific multicast (SSM) protocols.

- You can configure the policy in either of the following modes—these options are mutually exclusive:

  - Strict mode—Include the `strict` option to strictly direct matching flows only to the preferred AR replicator. If that AR replicator goes down, the AR leaf device drops any matching flows even if the device detects other available AR replicators in the network. When the preferred AR replicator comes back up again, the AR leaf resumes sending matching traffic to that AR replicator.

  - Loose mode—The default mode. You can optionally include a fallback AR replicator to use if the preferred AR replicator goes down. If the fallback AR replicator is also down or you don't specify a fallback, but the AR leaf device detects other AR replicators in the network, the device uses its default AR replicator load balancing method to distribute flows among the available other AR replicators. (See *Default AR Leaf Load-Balancing When Detecting Multiple AR Replicators*.)

    If the AR leaf device doesn't detect any available AR replicators in the network, the device defaults to ingress replication (replicates and forwards the multicast flows itself to the other devices with receivers interested in those flows).

Options

deterministic-ar-policy-name

Routing policy name that deterministically directs matching multicast flows to specified AR replicators.

You set deterministic AR routing policy conditions to match multicast flows in the `from` clause of the policy statement at the `[edit policy-options policy-statement deterministic-ar-policy-name]` hierarchy.

You set the policy action in the `then` clause of the policy using the `assisted-replication replicator-ip` *`replicator-ip-addr`* statement at the `[edit policy-options policy-statement` *`deterministic-ar-policy-name`* `then]` hierarchy.

The policy action must include the `replicator-ip` statement to specify a preferred AR replicator for this feature. Include the `strict` option if you don't want the matching flows to go to any AR replicator other than the preferred one. Or, you can optionally include a fallback AR replicator to which to send the matching flows if the specified AR replicator is down (use the `fallback-replicator-ip` option).

deterministic-port-block-allocation

IN THIS SECTION

- Syntax | 5557
- Hierarchy Level | 5557
- Description | 5557
- Options | 5558
- Required Privilege Level | 5558
- Release Information | 5558

Syntax

```
deterministic-port-block-allocation {
    block-size block-size;
    include-boundary-addresses;
}
```

Hierarchy Level

```
[edit services nat pool pool-name port]
```

Description

Configure algorithm-based allocation of blocks of destination ports. By specifying this method, you ensure that an incoming (source) IP address and port always map to the same destination IP address and port block, thus eliminating the need for logging address translations.

Options

block-size—Maximum number of ports that can be allocated to a user.

If `block-size` is configured as zero, the method for computing the block size is as follows:

block-size = int(65412/ceil[(Number of subscribers/Number of IP addresses in the NAT pool)]).

where

64512 is derived from (65535 - 1023) because the regular port assignments start from 1024.

Number of subscribers is derived from the from clause of the applicable NAT rule.

- **Default:** 256
- **Range:** 0 through 32,000

`include-boundary-addresses`—(Optional) Specifies that the lowest and highest addresses (the network and broadcast addresses) in the source address range of a NAT rule should be translated when the NAT pool is used. If the source address has a prefix of /32, the lowest and highest address are automatically translated.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1.

deterministic (Source NAT Next Gen Services)

IN THIS SECTION

- Syntax | 5559
- Hierarchy Level | 5559
- Description | 5559
- Options | 5560
- Required Privilege Level | 5560
- Release Information | 5560

Syntax

```
deterministic {
    block-size block-size;
    host {
        address address;
    }
    include-boundary-addresses;
}
```

Hierarchy Level

```
[edit services nat source pool nat-pool-name port]
```

Description

Configure deterministic NAT to ensure that the original internal source IPv4 or IPv6 address and port always map to the same post-NAT IPv4 address and block of ports. In addition, the reverse mapping of a given translated external IPv4 address and port are always mapped to the same internal IP address.

This eliminates the need for address translation logging.

Options

block-size *block-size*

The number of ports in the port block.

- **Range:** 1 to 64,512
- **Default:** 256

host address *address*

The first usable pre-NAT subscriber address, which is used to perform the deterministic NAT mapping.

include-boundary-addresses

Include the translation of the lowest and highest IPv4 addresses (the network and broadcast addresses) in the source address range of a NAT rule. This does not apply to IPv6 source addresses.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

device-attribute (Easy EVPN LAG Configuration)

IN THIS SECTION

- Syntax | 5561
- Hierarchy Level | 5561
- Description | 5561
- Options | 5562

Required Privilege Level | 5563
Release Information | 5563

Syntax

```
device-attribute {
  loopback {
    peer1-subnet peer1-subnet;
    peer2-subnet peer2-subnet;
    }
  peer-id peer-id;
  peer-to-peer {
    overlay-connectivity {
      ibgp;
    }
    peer-subnet {
     inet inet;
     inet6 inet6;
     interface-name [ interface-name ... ];
    }
    underlay-connectivity {
      ospf;
    }
  }
  system-id system-id;
}
```

Hierarchy Level

```
[edit services evpn]
```

Description

Specify device-specific parameters as part of a generated Ethernet VPN (EVPN) fabric configuration.

You use the statements in the `[edit services evpn]` hierarchy level to simplify configuring an EVPN fabric with Ethernet segment identifier (ESI) link aggregation groups (LAGs) in the topology. The feature you enable with statements in this hierarchy is an easy EVPN LAG configuration feature, also called EZ-LAG.

You only need to configure a few statements to provide the parameters required for an EVPN core fabric with multihomed or single-homed customer edge (CE) devices (or end server devices). When you commit the `[edit services evpn]` configuration statements, the device uses a commit script to generate the corresponding standard EVPN fabric configuration statements.

The statements at the `device-attribute` hierarchy level provide parameters for configuration elements that are specific to:

- The peer provider edge (PE) devices in the EVPN fabric.
- Setting up LACP on the ESI LAG interfaces to multihomed customer edge (CE) devices (or end servers).

Options

loopback (peer1-subnet *peer1-subnet* peer2-subnet *peer2-subnet*)

Specify the device loopback IPv4 subnet address for each of the peer PE devices. The `[edit services evpn]` commit script uses the *peer-id* of the device on which it runs to derive the statements in the generated configuration for:

- The router ID
- The device overlay local address and peer neighbor address

> **NOTE**: The commit process doesn't do a commit check to enforce setting the same loopback subnet addresses across both devices. As a result, you should make sure to set the easy EVPN LAG configuration loopback *peer1-subnet* address to the same value on both peer PE devices, and likewise for the *peer2-subnet* address.

peer-id *peer-id*

Assign a unique identifier to the PE device among its peer PE devices in the EVPN fabric. The `[edit services evpn]` commit script uses this value to derive the statements to set values in the generated configuration that must be unique across the peer PE devices.

- **Values for *peer-id*:** 1 or 2

system-id *system-id*

Specify the PE device's system ID, which is in the format of a MAC address. The `[edit services evpn]` commit script uses this value to derive statements to set up Link Aggregation Control Protocol (LACP) on the ESI LAG interfaces.

To configure LACP on an aggregated Ethernet interface in an ESI LAG, the commit script adds this *system-id* to the interface ESI parameter. The commit script uses that combined value as the LACP system-id in the generated LACP configuration statement. For example, if *system-id* is 10:11:12:13:14:10 and the interface ESI parameter is 1, the commit script generates the following statement in the configuration:

```
set interfaces ae3 aggregated-ether-options lacp system-id 10:11:12:13:14:11
```

> **NOTE**: You set an aggregated Ethernet interface's ESI parameter using the `esi-lag-id esi-lag-id` statement at the `[edit services evpn evpn-vxlan server server-name]` hierarchy level.

The remaining statements are explained in detail on separate pages.

You can also consult CLI Explorer.

- Options | 5568
- Required Privilege Level | 5568
- Release Information | 5568

Syntax

```
device-count number;
```

Hierarchy Level

```
[edit chassis aggregated-devices ethernet]
[edit chassis aggregated-devices sonet]
```

Description

Configure the number of aggregated logical devices available to the router.

Starting in Junos release 14.2, for MX series routers, aggregated Ethernet interfaces created under a logical system can be individually named. Prior to 14.2, ae interfaces were named automatically (AE1, AE2) etc. upon setting the device count. This change allows administrators to use custom naming schemes. System resources are only allocated for named ae interfaces, regardless of how many were declared in the device count. (In Junos 14.2 and earlier, ae naming occurred automatically up to the number specified for device count, and system resources were allocated whether a given ae interface was used or not.)

Options

number—Set the number of aggregated logical devices that will be available for configuration.

> **NOTE**: Starting with Junos OS Release 13.2, a maximum of 64 aggregated interfaces are supported for link aggregation of SONET/SDH interfaces. In releases before Junos OS Release 13.2, a maximum of 16 aggregated interfaces are supported for link aggregation of SONET/SDH interfaces.
>
> For Junos OS Evolved, you can specify up to 512 aggregated Ethernet devices.

- **Range:** 1 - 1000. The upper limit for this value is system specific.
- **Range:** 1 - 1052 for Junos OS Evolved.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

df-election-granularity

IN THIS SECTION

- Syntax | 5574
- Hierarchy Level | 5574
- Description | 5574
- Options | 5575
- Required Privilege Level | 5575
- Release Information | 5575

Syntax

```
df-election-granularity {
    per-esi {
        lacp-oos-on-ndf;
    }
    per-esi-vlan;
    per-evi;
}
```

Hierarchy Level

```
[edit interfaces name esi],
[edit interfaces name unit number esi]
```

Description

Configure the designated forwarder (DF) election granularity per member link for an aggregated Ethernet interface in an EVPN multihoming configuration.

The `per-esi lacp-oos-on-ndf` setting enables EVPN multihoming when:

- The peer provider edge (PE) devices in the multihomed Ethernet segment (ES) operate in active-standby (single-active) mode.

- The connection to the multihomed CE device is an aggregated Ethernet (AE) link with member links that connect to more than one of the peer PE devices.

When an aggregated Ethernet interface connects to the DF and you enable this option with single-active multihoming, the aggregated Ethernet interface emulates the behavior of an MC-LAG configuration (without requiring you to configure an ICCP or ICL interface). This behavior is different from in a standard EVPN multihoming configuration, where the logical interfaces you configure on an aggregated Ethernet interface can take different designated forwarder election roles.

In an EVPN single-active configuration, the provider edge (PE) device that is not the DF (the non-DF) sends LACP out-of-sync packets to the CE device. As a result, LACP goes down on the CE device, and the CE device doesn't send traffic on the links connected to the non-DF.

If the connection between a multihomed CE device and the DF PE device fails, the DF election process selects a new DF. If the connection between the CE device and a non-DF PE device fails, the current DF assignment remains the same.

NOTE: You can't configure both the `per-esi` option and the `per-esi-vlan` option with this statement at the same time. If you configure one of these statements when the other is already set, the CLI replaces the existing setting with the new one you've configured.

Options

The options are explained separately. You can click the linked statements in the Syntax section or search for a statement in CLI Explorer.

- `group1`—768-bit Modular Exponential (MODP) algorithm.
- `group2`—1024-bit MODP algorithm.
- `group5`—1536-bit MODP algorithm.

- `group14`—2048-bit MODP group.
- `group15`—3072-bit MODP algorithm.
- `group16`—4096-bit MODP algorithm.
- `group19`—256-bit random Elliptic Curve Groups modulo a Prime (ECP groups) algorithm.
- `group20`—384-bit random ECP groups algorithm.
- `group21`—521-bit random ECP groups algorithm.
- `group24`—2048-bit MODP Group with 256-bit prime order subgroup.

We recommend that you use `group14`, `group15`, `group16`, `group19`, `group20`, or `group21` instead of `group1`, `group2`, or `group5`.

We support `group15`, `group16`, and `group21` options only with iked process when `junos-ike` package is installed.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

Support for the `group14` option added in Junos OS Release 11.1.

Support for `group19`, `group20`, and `group24` options added in Junos OS Release 12.1X45-D10.

Support for `group19` and `group20` options added in Junos OS Release 15.1X49-D70 for vSRX Virtual Firewall.

Support for `group15`, `group16`, and `group21` options added in Junos OS Release 19.1R1 on SRX5000 line of devices with `junos-ike` package installed.

Starting in Junos OS Release 20.2R1, we've changed the help text description as `NOT RECOMMENDED` for the CLI options `group1`, `group2`, and `group5` for devices running IKED with `junos-ike` package installed.

Support for `group15`, `group16`, and `group21` options added in Junos OS Release 20.3R1 on vSRX Virtual Firewall instances with `junos-ike` package installed.

Support for `group15`, `group16`, and `group21` options added in Junos OS Release 21.1R1 on vSRX Virtual Firewall 3.0 instances with `junos-ike` package installed.

}
```

Hierarchy Level

```
[edit access address-assignment pool pool-name family inet6]
```

Description

Configure attributes for address pools that can be used by different clients.

Options

- `dns-server` *IPv6-address*—Specify a DNS server to which clients can send DNS queries.
- `grace-period` *seconds* —Specify the grace period offered with the lease.
- **Range:** 0 through 4,294,967,295 seconds
- **Default:** 0 (no grace period)

- `maximum-lease-time` *`seconds`*—Specify the maximum length of time in seconds for which a client can request and hold a lease on a DHCP server.
- **Range:** 30 through 4,294,967,295 seconds
- **Default:** 86,400 seconds (24 hours)
- `option` *`dhcp-option-identifier-code`*—Specify the DHCP option identifier code.
- `propagate-ppp-settings [`*`interface-name`*—Specify PPP interface name for propagating DNS or WINS settings.
- `sip-server-address` *`IPv6-address`*—Specify the IPv6 address of the SIP outbound proxy server.
- `sip-server-domain-name` *`domain-name`*—Specify the domain name of the SIP outbound proxy server.

Required Privilege Level

access—To view this statement in the configuration.

access-control—To add this statement to the configuration.

}
```

Hierarchy Level

```
[edit access address-assignment pool pool-name family family]
```

Description

Configure DHCP attributes for the protocol family in a specific address pool. The attributes determine options and behaviors for the DHCP clients.

Options

boot-file

Set the boot file advertised to DHCP clients. After the client receives an IP address and the boot file location from the DHCP server, the client uses the boot image stored in the boot file to complete DHCP setup. This configuration is equivalent to DHCP option 67.

- **Values:** *filename*—Location of the boot file on the boot server. The filename can include a pathname.

boot-server

Configure the name of the boot server advertised to DHCP clients. The client uses a boot file located on the boot server to complete DHCP setup. This configuration is equivalent to DHCP option 66.

- Values:
  - *address*—IPv4 address of a boot server.
  - *hostname*—Fully qualified hostname of a boot server.

dns-server

Specify a DNS server to which clients can send DNS queries. This is equivalent to DHCPv6 option 23. To specify multiple DNS servers, add multiple `dns-server` statements in order of preference.

- **Values:** *ipv6-address*—IPv6 address of a DNS server.

domain-name

Configure the name of the domain in which clients search for a DHCP server host. This is the default domain name that is appended to hostnames that are not fully qualified. This is equivalent to DHCP option 15.

- **Values:** *domain-name*—Name of the domain.

exclude-prefix-len *exclude-prefix-length*

Specify the length of the IPv6 prefix to be excluded from the delegated prefix. Range: 1 through 128.

grace-period

Configure the amount of time that the client retains the address lease after the lease expires. The address cannot be reassigned to another client during the grace period.

- **Values:** *seconds*—Number of seconds the lease is retained.
- **Range:** 0 through 4,294,967,295 seconds.
- **Default:** 0 (no grace period).

maximum-lease-time

Specify the maximum length of time, in seconds, that the lease is held for a client if the client does not renew the lease. This is equivalent to DHCP option 51. The `maximum-lease-time` is mutually exclusive with both the `preferred-lifetime` and the `valid-lifetime`, and cannot be configured with either timer.

- **Values:** *seconds*—Maximum number of seconds the lease can be held.
- **Range:** 30 through 4,294,967,295 seconds.
- **Default:** 86,400 (24 hours).

name-server

Configure one or more Domain Name System (DNS) name servers available to the client to resolve hostname-to-client mappings. This is equivalent to DHCP option 6.

- **Values:** *server-names*—IP addresses of the domain name servers, listed in order of preference.

netbios-node-type

Specify the NetBIOS node type. This is equivalent to DHCP option 46.

- **Values:** *node-type*—One of the following node types:
  - b-node—Broadcast node.
  - h-node—Hybrid node.
  - m-node—Mixed node.
  - p-node—Peer-to-peer node.

option

Specify user-defined options that are added to client packets. Starting in Junos OS Release 13.3, the `hex-string` option type was introduced.

- Values:
  - *array*—An option can include an array of option types.

- *id-number*—Any whole number. The ID number is used to index the option and must be unique across a DHCP server.
- *option-type*—Any of the following types: byte, byte-stream, flag, hex-string, integer, ip-address, short, string, unsigned-integer, or unsigned-short.
- *option-value*—Value associated with an option. The option value must be compatible with the option type (for example, an On or Off value for a flag type).

preferred-lifetime

Specify the length of time, in seconds, that the DHCPv6 server keeps the IPv6 prefix active. When the lifetime expires, the address is deprecated. If the `valid-lifetime` is also configured, the `preferred-lifetime` must be less than the `valid-lifetime`. The `preferred-lifetime` and the `maximum-lease-time` are mutually exclusive and cannot both be configured.

- **Values:** *seconds*—Number of seconds that the IPv6 prefix is active.
- **Range:** 30 through 4,294,967,295 seconds.
- **Default:** 86,400 (24 hours).

router

Specify one or more routers located on the client's subnet. This statement is the equivalent of DHCP option 3.

- **Values:** *router-address*—IP address of one or more routers.

server-identifier

Specify the IP address that is used as the source address the DHCP server includes in IP packets when communicating with clients. The address is included in the DHCP packet in option 54.

- **Values:** *ipv4-address*—IP address.

sip-server-address

Specify a SIP outbound proxy server that DHCPv6 local server clients can use. This is equivalent to DHCPv6 option 22. To specify multiple servers, add multiple `sip-server-address` statements in order of preference.

- **Values:** *`ipv6-address`*—IPv6 address of a SIP outbound proxy server.

sip-server-domain-name

Configure the domain name of the SIP outbound proxy server that DHCPv6 local server clients can use. This is equivalent to DHCPv6 option 21.

- **Values:** *domain-name*—Name of the domain.

t1-percentage

Specify a percentage of the `preferred-lifetime` value. After this percentage of the `preferred-lifetime` value elapses, the DHCPv4 or DHCPv6 client requests an extension on its lease from the originating DHCP local server. The `t1-percentage` is also referred to as

the renewal time. The `t1-percentage` value must be less than the `t2-percentage` value. DHCPv4 server support was added in Junos OS Release 17.2.

- **Values:** *percentage*—Percentage of the `preferred-lifetime` value.
- **Range:** 0 through 100.
- **Default:** If the `t1-percentage` value is not configured, the default is based on the `preferred-lifetime` value:
  - If the `preferred-lifetime` value is finite, the default is 50 percent of the `preferred-lifetime` value.
  - If the `preferred-lifetime` value is infinite, the default is also infinite.

t1-renewal-time

Specify the time (T1) at which the DHCPv4 or DHCPv6 client requests an extension (renewal) of the existing lease. This time is expressed as the number of seconds since the beginning of the lease. Using this statement to configure a duration in seconds is an alternative to using the `t1-percentage` statement.

- **Values:** *seconds*—Number of seconds.
- **Range:** 30 through 4,294,967,295 seconds.
- **Default:** 50 percent of the lease duration (`preferred-lifetime`).

t2-percentage

Specify a percentage of the `preferred-lifetime` value. After this percentage of the `preferred-lifetime` value elapses, the DHCPv4 or DHCPv6 client requests an extension on its lease from any available DHCPv4 or DHCPv6 server. The `t2-percentage` is also referred to as the rebinding time. The `t2-percentage` value must be greater than the `t1-percentage` value. DHCPv4 server support was added in Junos OS Release 17.2.

- **Values:** *percentage*—Percentage of the `preferred-lifetime` value.
- **Range:** 0 through 100.
- **Default:** Default: If the `t2-percentage` value is not configured, the default is based on the `preferred-lifetime` value:
  - If the `preferred-lifetime` value is finite, the default is 80 percent of the `preferred-lifetime` value.
  - When the `preferred-lifetime` value is infinite, the default is also infinite.

t2-rebinding-time

Specify the time (T2) at which the DHCPv4 or DHCPv6 client attempts to contact any DHCP server to request an extension (rebinding) of the existing lease. This time is

expressed as the number of seconds since the beginning of the lease. Using this statement to configure a duration in seconds is an alternative to using the `t2-percentage` statement.

- **Values:** *seconds*—Number of seconds.
- **Range:** 30 through 4,294,967,295 seconds.
- **Default:** The default value depends on the client:
  - (DHCPv4 clients) 87.5 percent of the lease duration (`preferred-lifetime`).
  - (DHCPv6 clients) 80 percent of the lease duration (`preferred-lifetime`).

tftp-server Specify the Trivial File Transfer Protocol (TFTP) server that the client uses to obtain the client configuration file. This is equivalent to DHCP option 150.

- **Values:** *ip-address*—IP address of the TFTP server.

valid-lifetime Specify the length of time, in seconds, that the DHCPv6 server keeps the IPv6 prefix valid. When the lifetime expires, the address becomes invalid. If the `preferred-lifetime` is also configured, the `valid-lifetime` must be greater than the `preferred-lifetime`. The `valid-lifetime` and the `maximum-lease-time` are mutually exclusive and cannot both be configured.

- **Values:** *seconds*—Number of seconds that the IPv6 prefix is valid.
- **Range:** 30 through 4,294,967,295 seconds.
- **Default:** 86,400 (24 hours).

wins-server Specify one or more NetBIOS name servers (NBNS) that the client uses to resolve NetBIOS names. This is equivalent to DHCP option 44.

- **Values:** *ipv4-address*—IP address of each NetBIOS name server. Add them to the configuration in order of preference.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.0.

`exclude-prefix-len` statement introduced in Junos OS Release 17.3 for MX Series.

}
```

Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number family family]
```

Description

Configure the Dynamic Host Configuration Protocol (DHCP) client.

Options

- **force-discover**—Forces the DHCP client to send a DHCP discover packet after one to three failed `dhcp-request` attempts. The `force-discover` option ensures that the DHCP server will assign the same or a new IP address to the client.
- **lease-time**—Specify the time to negotiate and exchange DHCP information.
  - **infinite**—Lease never expires.
  - **length**—Number of seconds.
- **no-dns-install**—Do not add DNS information to the DHCP client (resolve.conf) even after learn from DHCP server
- **retransmission-attempt**—Specify the number of times the device attempts to retransmit a DHCP packet fallback. Range is 0-6.
- **server-address**—Specify the preferred DHCP server address that is sent to DHCP clients.
- **update-server**—Propagate TCP/IP settings to a local DHCP server.
- **vendor-id**—Vendor class ID for the DHCP client.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1X44-D10.

Starting with Junos OS Release 17.4R1 and Junos OS Release 15.1X49-D60, on all SRX Series Firewalls and vSRX Virtual Firewall instances, the CLI option `dhcp-client` at `[edit interfaces interface-name unit logical-unit-number family inet]` hierarchy is changed to `dhcp` to align with other Junos platforms. There is no change in the functionality.

Description

Configure a Dynamic Host Configuration Protocol (DHCP) client for an IPv4 interface for logical systems and tenant systems.

The remaining statements are described separately.

> **NOTE**: Starting in Junos OS Release 18.1R1, DHCPv4 and DHCPv6 clients are supported on management interfaces (fxp0 and em0) configured in the non-default management routing instance, `mgmt_junos`.

Options

client-identifier duid-type	Identify a client by a client-identifier value. This statement is mandatory.
no-dns-install	Do not add DNS information to the DHCP client even after it is learned from the DHCP server.
options	Specify options requested by the DHCPv4 client.
force-discover	Send DHCPDISCOVER after DHCPREQUEST retransmission failure
lease-time	Specify lease time in seconds requested in DHCP client protocol packet (60 through 2147,,483,647 seconds for SRX devices)
metric	client initiated default-route metric (0..255 for SRX Series devices)
requested-options	Specify the DHCP options.

The remaining statements are explained separately.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.0.

The `logical-systems` and `tenants` options are introduced in Junos OS Release 18.4R1.

Description

Configure Dynamic Host Configuration Protocol (DHCP) local server options on the router or switch to enable the router or switch to function as an extended DHCP local server. The DHCP local server receives DHCP request and reply packets from DHCP clients and then responds with an IP address and other optional configuration information to the client.

The extended DHCP local server is incompatible with the DHCP server on J Series routers and, therefore, is not supported on J Series routers. Also, the DHCP local server and the DHCP/BOOTP relay server, which are configured under the `[edit forwarding-options helpers]` hierarchy level, cannot both be enabled on the router or switch at the same time. The extended DHCP local server is fully compatible with the extended DHCP relay feature.

The `dhcpv6` stanza configures the router or switch to support Dynamic Host Configuration Protocol for IPv6 (DHCPv6). The DHCPv6 local server is fully compatible with the extended DHCP local server and the extended DHCP relay feature.

> **NOTE**: When you configure the `dhcp-local-server` statement at the routing instance hierarchy level, you must use a routing instance type of `virtual-router`.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.0.

```

Description

When the switch receives a DHCP request from a DHCP client connected on one of the switch's interfaces, have the switch insert DHCP option 82 (also known as the DHCP relay agent information option) information in the DHCP request packet header before it forwards or relays the request to a DHCP server. The server uses the option 82 information, which provides details about the circuit and host the request came from, in formulating the reply; the server does not, however, make any changes to the option 82 information in the packet header. The switch receives the reply and then removes the DHCP option 82 information before forwarding the reply to the client.

The remaining statements are explained separately. See CLI Explorer.

Default

Insertion of DHCP option 82 information is not enabled.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.3.

Description

Configure extended Dynamic Host Configuration Protocol (DHCP) relay and DHCPv6 relay options on the router or switch to enable the router (or switch) to function as a DHCP relay agent. A DHCP relay agent forwards DHCP request and reply packets between a DHCP client and a DHCP server.

DHCP relay supports the attachment of dynamic profiles and also interacts with the local AAA Service Framework to use back-end authentication servers, such as RADIUS, to provide subscriber authentication or client authentication. You can attach dynamic profiles and configure authentication support on a global basis or for a specific group of interfaces.

The extended DHCP and DHCPv6 relay agent options configured with the `dhcp-relay` and `dhcpv6` statements are incompatible with the DHCP/BOOTP relay agent options configured with the `bootp` statement. As a result, the extended DHCP or DHCPv6 relay agent and the DHCP/BOOTP relay agent cannot both be enabled on the router (or switch) at the same time.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.3.

Description

Configure Dynamic Host Configuration Protocol (DHCP) snooping on the router. When acting as a snooping agent, the MX Series router typically is located between the client and the DHCP relay agent. It creates filters by “snooping” DHCP messages and binding DHCP-issued IP addresses to the MAC address of the client. These filters help prevent DHCP spoofing.

Configure DHCP snooping by including the appropriate interfaces in the DHCP relay configuration.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.4 (MX Series routers only).

dhcp-relay (Easy EVPN LAG Configuration)

IN THIS SECTION

- Syntax | 5638
- Hierarchy Level | 5639
- Description | 5639
- Options | 5639
- Required Privilege Level | 5640
- Release Information | 5640

Syntax

```
dhcp-relay name {
    dhcp-server-address dhcp-server-address;
    relay-source DHCP-relay-source-interface;
    vrf-instance vrf-instance-id;
};
```

Hierarchy Level

```
[edit services evpn evpn-vxlan]
```

Description

Specify Dynamic Host Configuration Protocol (DHCP) relay parameters for a generated configuration for an Ethernet VPN (EVPN) fabric with Virtual Extensible LAN (VXLAN) encapsulation.

You use the statements in the `[edit services evpn]` hierarchy level to simplify configuring an EVPN fabric with Ethernet segment identifier (ESI) link aggregation groups (LAGs) in the topology. The feature you enable with statements in this hierarchy is an easy EVPN LAG configuration feature, also called EZ-LAG.

You only need to configure a few statements to provide the parameters required for an EVPN core fabric with multihomed or single-homed customer edge (CE) devices (or end server devices). When you commit the `[edit services evpn]` configuration statements, the device uses a commit script to generate the corresponding standard EVPN fabric configuration statements.

The statements at the `[edit services evpn evpn-vxlan dhcp-relay]` hierarchy level provide the DHCP relay parameters the commit script needs to generate a default configuration for a DHCP relay group in an EVPN-VXLAN fabric.

Options

name	The group name to identify a DHCP server and relay group. The commit script generates configuration statements to create the DHCP relay group.
dhcp-server-address *dhcp-server-address*	(Required) The IP address of the DHCP server. The commit script uses this address in the generated configuration to enable the DHCP relay server group.
relay-source *DHCP-relay-source-interface*	The DHCP relay source loopback interface IP address. The commit script generates DHCP `overrides relay-source` statements that use this source address.
vrf-instance *vrf-instance-id*	(Required) The virtual routing and forwarding (VRF) instance identifier for which you want to configure DHCP relay. You specify VRF instance IDs by number in this easy EVPN LAG configuration feature. The commit script appends the VRF instance ID to a default VRF instance name to generate the configuration statements for different tenant VRF instances. • **Range:** 1 through 255

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 23.2R1 and Junos OS Evolved Release 23.2R1.

Description

Configure DHCP or DHCPv6 snooping on the switch. DHCP snooping is also enabled automatically if you configure any of the following port security features within this hierarchy:

- Dynamic ARP inspection (DAI)
- IP source guard
- DHCP option 82
- Static IP

For switches that support DHCPv6, both DHCP snooping and DHCPv6 snooping are enabled automatically if you configure any of the afore-mentioned features or any of the following IPv6 features:

- IPv6 neighbor discovery inspection
- IPv6 source guard
- Static IPv6

The remaining statements are explained separately.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2X50-D10 .

Support for `static-ipv6`, `neighbor-discovery-inspection`, `ipv6-source-guard`, `no-dhcpv6-snooping`, and `no-option37` introduced in Junos OS Release 13.2X51-D20 for EX Series switches.

Support for `dhcpv6-options`, `option-16`, `option-18`, `option-37`, `no-dhcpv6-options`, `no-option16`, `no-option18`, and `no-option37` introduced in Junos OS Release 14.2 for EX Series switches.

Support for `mine-dhcp-client-options` and `mine-dhcpv6-client-options` introduced in Junos OS Release 23.1.

Hierarchy Level

```
[edit system processes]
```

Description

Enable DHCP services on the device. DHCP services automate network-parameter assignment to network devices. The DHCP service process is enabled by default. However, by default, IP-MAC bindings in the DHCP snooping database do not persist through device reboots. You can inprove performance after rebooting by configuring the IP-MAC bindings to persist, by configuring a storage location for the DHCP database file. When specifying the location for the DHCP database, you must also specify how frequently the switch writes the database entries into the DHCP snooping database file.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Syntax

```
dhcp-tags {
    algorithm algorithm;
    priority priority;
}
```

Hierarchy Level

```
[edit class-of-service adjustment-control-profiles profile-name application]
```

Description

Configure the shaping rate adjustment controls for the DHCP tags application. DHCP tags are supported for session negotiation for DHCPv4 and DHCPv6 over IP demux and VLAN demux interfaces. This means that shaping rates received from DHCP option 82 in the DISCOVER message or DHCPv6 option 17 in the SOLICIT can be used to apply a shaping rate to the logical interface.

NOTE: Single-session dual-stack DHCP is not fully supported; for example, when rates vary between the individual DHCP sessions during negotiation.

Options

algorithm Rate adjustment algorithm used by the DHCP Tags application.

- Values:
  - adjust-always—Adjust the shaping rate unconditionally.
  - adjust-greater—Adjust the shaping rate if it is greater than the configured value.
  - adjust-greater-or-equal—Adjust the shaping rate if it is greater than or equal to the configured value.
  - adjust-less—Adjust the shaping rate if it is less than the configured value.
  - adjust-less-or equal—Adjust the shaping rate if it is less than or equal to the configured value.
  - adjust-never—Do not perform rate adjustments.
- **Default:** adjust-less

priority Priority of the DHCP tags application in the adjustment control profile.

- **Range:** 1 through 10; 1 is the highest priority.
- **Default:** 2

Required Privilege Level

Description

Configure the Dynamic Host Configuration Protocol version 6 (DHCPv6) client.

> **NOTE**: NOTE: Starting in Junos OS Release 17.3R1 (on MX Series) and Junos OS Release 18.3R1 (on SRX Series), DHCPv4 and DHCPv6 clients are supported on management interfaces (fxp0 and em0) configured in the non-default management routing instance, `mgmt_junos`.

Options

client-ia-type	Identity association type for DHCPv6 client. This statement is mandatory.
client-identifier duid-type	Identity a client by a client-identifier value. This statement is mandatory.

client-type	Identify the type of DHCPv6 client. This statement is mandatory.
interface-identifier	(Optional) Specify the interface ID during assignment of WAN interface IP through Stateless Address Auto Configuration (SLAAC).
prefix-identifier	(Optional) Specify last bits of the prefix for the respective dynamic pool. The subnet-id must be of at least network-prefix-length bits. In absence of dynamic pool, the received prefix is used to configure LAN interfaces for router advertisement
rapid-commit	The use of the two-message exchange for address assignment.
req-option	Specify options requested by the DHCPv6 client.
retransmission-attempt number	Specify the number of times the device retransmits a DHCPv6 client packet if a DHCPv6 server fails to respond. After the specified number of attempts, no further attempts at reaching a server are made.
update-router-advertisement	Specify the interface used to delegate prefixes.
update-server	Propagate TCP/IP settings to the DHCPv6 server.
use-ra-prefix	(Optional) Enable WAN IP assignment from router advertisement prefix in stateful mode.

For detailed information about these commands, see CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1X45-D10.

Statement introduced in Junos OS Release 24.2R1 for NFX Series Routers.

The `logical-systems` and `tenants` options are introduced in Junos OS Release 18.4R1.

```

Description

Configure DHCPv6 local server options on the router or switch to enable the router or switch to function as a server for the DHCP protocol for IPv6. The DHCPv6 local server sends and receives packets using the IPv6 protocol and informs IPv6 of the routing requirements of router clients. The local server works together with the AAA service framework to control subscriber access (or DHCP client access) and accounting.

The DHCPv6 local server is fully compatible with the extended DHCP local server and DHCP relay agent.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

```

Description

Configure DHCPv6 relay options on the router or switch and enable the router or switch to function as a DHCPv6 relay agent. A DHCPv6 relay agent forwards DHCPv6 request and reply packets between a DHCPv6 client and a DHCPv6 server.

The DHCPv6 relay agent server is fully compatible with the extended DHCP local server and DHCP relay agent. However, the options configured with the `dhcpv6` statement are incompatible with the DHCP/BOOTP relay agent options configured with the `bootp` statement. As a result, the DHCPv6 relay agent and the DHCP/BOOTP relay agent cannot be enabled on the router or switch at the same time.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.4.

Support for `forward-snooped-clients` introduced in Junos OS Release 15.1X53-D56 for EX Series switches and Junos OS Release 17.1R1.

- Default | 5676
- Required Privilege Level | 5676
- Release Information | 5676

Syntax

```
dhcpv6-snooping-file (local_pathname | remote_URL);
    location local_pathname | remote_URL;
    timeout seconds;
    write-interval seconds;
}
```

Hierarchy Level

- For platforms with Enhanced Layer 2 Software (ELS):

```
[edit system processes  dhcp-service];
```

- For platforms without ELS:

```
[edit ethernet-switching-options secure-access-port]
```

Description

Ensure that IP-MAC bindings persist through switch reboots by specifying a local pathname or a remote URL for the storage location of the DHCPv6 snooping database file.

The remaining statements are explained separately. See CLI Explorer.

Default

The IP-MAC bindings in the DHCPv6 snooping database are not persistent. If the switch is rebooted, the bindings are lost.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2X51-D20.

Support at the `[edit ethernet-switching-options secure-access-port]` hierarchy level introduced in Junos OS 14.1X53-D10 for EX Series switches.

- Hierarchy Level | 5682
- Description | 5682
- Default | 5683
- Options | 5683
- Required Privilege Level | 5683
- Release Information | 5683

Syntax

```
diag-port-authentication (encrypted-password "password" | plain-text-password);
```

Hierarchy Level

```
[edit system]
```

Description

Configure a password for performing diagnostics on the router's System Control Board (SCB), System and Switch Board (SSB), Switching and Forwarding Module (SFM), or Forwarding Engine Board (FEB) port.

For routers that have more than one SSB, the same password is used for both SSBs.

> **NOTE**: Do not run diagnostics on the SCB, SSB, SFM, or FEB unless you have been instructed to do so by Customer Support personnel.

Default

No password is configured on the diagnostics port.

Options

`encrypted-password` *password*—Use MD5 or other encrypted authentication. Specify the MD5 or other password. You can specify only one encrypted password for each user.

You cannot configure a blank password for `encrypted-password` using blank quotation marks (" "). You must configure a password whose number of characters range from 1 through 128 characters and enclose the password in quotation marks.

`plain-text-password`—Use a plain-text password. The CLI prompts you for the password and then encrypts it. The CLI displays the encrypted version, and the software places the encrypted version in its user database. You can specify only one plain-text password for each user.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Syntax

```
dial-options {
    ipsec-interface-id name;
    l2tp-interface-id name;
    (shared | dedicated);
}
```

Hierarchy Level

```
[edit interfaces sp-fpc/pic/port unit logical-unit-number],
[edit interfaces si-fpc/pic/port unit logical-unit-number],
[edit logical-systems logical-system-name interfaces sp-fpc/pic/port unit logical-unit-number],
[edit logical-systems logical-system-name interfaces si-fpc/pic/port unit logical-unit-number]
```

Description

Specify the options for configuring logical interfaces for group and user sessions in L2TP or IPsec dynamic endpoint tunneling.

Options

`dedicated`—(LNS on M Series routers and MX Series routers only) Specify that a logical interface can host only one session at a time.

`ipsec-interface-id` *name*—(M Series routers only) Interface identifier for group of dynamic peers. This identifier must be replicated at the `[edit access profile` *name* `client * ike]` hierarchy level.

`l2tp-interface-id` *name*—Interface identifier that must be replicated at the `[edit access profile` *name*`]` hierarchy level.

`shared`—(LNS on M Series routers only) Specify that a logical interface can host multiple (shared) sessions at a time.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

The `[edit ...si-...]` hierarchy levels introduced in Junos OS Release 11.4.

Syntax

```
dial-options {
    ipsec-interface-id name;
    l2tp-interface-id name;
    (shared | dedicated);
}
```

Hierarchy Level

```
[edit dynamic-profiles profile-name interfaces interface-name unit logical-unit-number]
```

Description

Specify the options for configuring logical interfaces in dynamic profiles for group and user sessions in L2TP or IPsec dynamic endpoint tunneling.

Options

dedicated (LNS on M Series routers and MX Series routers only) Specify that a logical interface can host only one session at a time.

ipsec-interface-id *name* Interface identifier for group of dynamic peers. This identifier must be replicated at the `[edit access profile name client * ike]` hierarchy level. This option is not currently supported for dynamic profiles.

l2tp-interface-id *name* (MX Series routers only) L2TP interface identifier that must be replicated at the `[edit access profile name]` hierarchy level.

shared (LNS on M Series routers only) Specify that a logical interface can host multiple (shared) sessions at a time

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.4.

dial-string

IN THIS SECTION

- Syntax | 5687
- Hierarchy Level | 5688
- Description | 5688
- Options | 5688
- Required Privilege Level | 5688
- Release Information | 5688

Syntax

```
dial-string [ dial-string-numbers ];
```

Hierarchy Level

```
[edit interfaces br-pim/0/port unit logical-unit-number dialer-options],
[edit logical-systems logical-system-name interfaces br-pim/0/port unit logical-unit-number
dialer-options]
```

Description

On J Series Services Routers with ISDN interfaces, specify one or more ISDN dial strings used to reach a destination subnetwork.

Options

dial-string-numbers—One or more strings of numbers to call.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

dialer

IN THIS SECTION

- Syntax | 5689
- Hierarchy Level | 5689
- Description | 5689
- Options | 5689
- Required Privilege Level | 5689
- Release Information | 5689

Syntax

```
dialer filter-name;
```

Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number family family],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number
family family]
```

Description

Apply a dialer filter to an interface. To create the dialer filter, include the `dialer-filter` statement at the `[edit firewall filter family family]` hierarchy level.

Options

filter-name—Dialer filter name.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

dialer-options

IN THIS SECTION

Syntax | 5690

- Hierarchy Level | 5690
- Description | 5691
- Required Privilege Level | 5691
- Release Information | 5691

Syntax

```
dialer-options {
    activation-delay seconds;
    callback;
    callback-wait-period time;
    deactivation-delay seconds;
    dial-string [ dial-string-numbers ];
    idle-timeout seconds;
    incoming-map {
        caller caller-number | accept-all;
        initial-route-check seconds;
        load-interval seconds;
        load-threshold percent;
        pool pool-name;
        redial-delay time;
        self-recover-time
        watch-list {
            [ routes ];
        }
    }
}
```

Hierarchy Level

```
[edit interfaces umd0],
[edit interfaces dln unit logical-unit-number],
[edit logical-systems logical-system-name interfaces dln unit logical-unit-number]
```

Description

Specify the dialer options for configuring logical interfaces for group and user sessions.

The remaining statements are explained separately. See CLI Explorer.

You can use the new CLI option `self-recover-time` to configure the amount of time the `cl` interface waits to reconnect to a network after a disconnect occurs. In certain ISP networks, the modem disconnects and then reconnects after several seconds. The `self-recover-time` option provides enough time for the `cl` interface to reconnect instead of failing over to another `cl` interface immediately. If the reconnection attempt times out, then the connection fails over to another `cl` interface.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

direct-access (Commit Scripts)

IN THIS SECTION

- Syntax | 5707
- Hierarchy Level | 5707
- Description | 5707
- Required Privilege Level | 5707
- Release Information | 5707

Syntax

```
direct-access;
```

Hierarchy Level

```
[edit system scripts commit]
```

Description

Enable SLAX and XSLT commit scripts to read the input configuration directly from the database.

During a commit operation, the management process exports the post-inheritance candidate configuration in XML format and passes it as input to the commit script. If the configuration is large, the script driver might have trouble reading it into memory for commit script processing. When this occurs, you can configure the `direct-access` statement to enable the script driver to retrieve the *candidate configuration* directly from the configuration database. We recommend configuring the `direct-access` statement only if the configuration is large, because directly accessing the configuration data is processor-intensive and can affect system performance

> **NOTE**: Junos OS supports configuring the `direct-access` statement only when SLAX and XSLT commit scripts are configured. It does not support configuring the `direct-access` statement when Python commit scripts are also configured.

Required Privilege Level

maintenance—To view or add this statement in the configuration.

Release Information

Statement introduced in Junos OS Release 9.1.

```
[edit services rpm rfc2544-benchmarkingtests test-name test-name]
```

Junos OS Evolved Hierarchy Level

```
[edit services monitoring rfc2544 tests test-name test-name]
```

Description

Specify the direction of the interface on which the test must be run. This parameter is valid only for a `ccc` , a `ethernet-switching` or a `bridge` family. RFC2544 tests are supported only in the egress direction or the user-to-network interface (UNI) direction of an E-line or E-LAN service parameters in a bridge domain between two routers for unicast traffic. You cannot compute the NNI direction of Ethernet services between two routers for multicast or broadcast traffic.

Options

egress Run the test in the egress direction of the interface (network-to-network interface (NNI)). This option is applicable for a `ccc`, `bridge`, or `ethernet-switching` family.

ingress Run the test in the ingress direction of the interface (user-to-network interface (UNI)). You cannot configure this option for a `bridge` or `ethernet-switching` family.

Required Privilege Level

Configuring IPsec Rules

direction (Secure-channel)

IN THIS SECTION

- Syntax | 5713
- Hierarchy Level | 5713
- Description | 5713
- Default | 5714
- Options | 5714
- Required Privilege Level | 5714
- Release Information | 5714

Syntax

```
direction (inbound | outbound);
```

Hierarchy Level

```
[edit security macsec connectivity-association connectivity-association-name secure-channel secure-channel-name]
```

Description

Configure whether the secure channel applies MACsec security to traffic entering or leaving an interface.

If you need to apply MACsec on traffic entering and leaving an interface, you need to create one secure channel to apply MACsec on incoming traffic and another secure channel to apply MACsec on outgoing traffic within the same connectivity association. When you associate the connectivity association with an interface, MACsec is applied on traffic entering and leaving that interface.

You only use this configuration option when you are configuring MACsec using static secure association keys (SAK) security mode. When you are configuring MACsec using static connectivity association keys

(CAK) security mode, two secure channels that are not user-configurable—one inbound secure channel and one outbound secure channel—are automatically created within the connectivity association.

Default

This statement does not have a default value.

If you have configured a secure channel to enable MACsec using static SAK security mode, you must specify whether the secure channel applies MACsec to traffic entering or leaving an interface. A candidate configuration that contains a secure channel that has not configured a direction cannot be committed.

Options

inbound Enable MACsec security on traffic entering the interface that has applied the secure channel.

outbound Enable MACsec security on traffic leaving the interface that has applied the secure channel.

The remaining statements are explained separately.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2X50-D15.

Syntax

```
direction {
    any;
    client-to-server;
    server-to-client;
}
```

Hierarchy Level

[edit services application-identification application *application-name* over *protocol-type* signature *name* member *name*]

Description

The connection direction of the packets to apply pattern matching. You can specify match patterns on both client to server and server to client while configuring custom application signatures.

Options

any The directions of packets are either from client-side to server-side or from server-side to client-side.

client-to-server The direction of packets is from client-side to server-side.

server-to-client The direction of packets is from server-side to client-side.

Required Privilege Level

services—To view this statement in the configuration.

services-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1X49-D40.

IN THIS SECTION

- Syntax | 5718
- Hierarchy Level | 5718
- Description | 5718
- Options | 5719
- Required Privilege Level | 5719
- Release Information | 5719

Syntax

```
direction (bidirectional | inbound | outbound) {
    protocol esp;
    spi spi-value;
    encryption {
        algorithm 3des-cbc;
        key ascii-text ascii-text-string;
    }
}
```

Hierarchy Level

```
[edit security ipsec internal security-association manual],
[edit security trusted-channel ipsec security-association manual]
```

Description

Establish a manual security association (SA) for internal Routing-Engine–to–Routing-Engine communication.

Options

`bidirectional`—Apply the same SA values in both directions between Routing Engines.

`inbound`—Apply these SA properties only to the inbound IPsec tunnel.

`outbound`—Apply these SA properties only to the outbound IPsec tunnel.

The remaining statements are explained separately.

Required Privilege Level

Crypto Officer—To view and add this statement in the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

direction (Junos OS)

IN THIS SECTION

- Syntax | 5719
- Hierarchy Level | 5720
- Description | 5720
- Options | 5720
- Required Privilege Level | 5720
- Release Information | 5720

Syntax

```
direction (inbound | outbound | bidirectional) {
    authentication {
        algorithm (hmac-md5-96 | hmac-sha1-96);
        key (ascii-text key | hexadecimal key);
```

```
    }
    auxiliary-spi auxiliary-spi-value;
    encryption {
        algorithm (des-cbc | 3des-cbc);
        key (ascii-text key | hexadecimal key);
    }
    protocol (ah | esp | bundle);
    spi spi-value;
}
```

Hierarchy Level

```
[edit security ipsec security-association sa-name manual]
```

Description

Define the direction of IPsec processing.

Options

inbound—Inbound SA—Define algorithms, keys, or security parameter index (SPI) values to decrypt and authenticate incoming traffic coming from the peer.

outbound—Outbound SA—Define algorithms, keys, or SPI values to decrypt and authenticate outbound traffic to the peer.

bidirectional—Bidirectional SA—Decrypt and authenticate the incoming and outgoing traffic using the same algorithm, keys, or SPI in both directions, unlike inbound and outbound SAs that use different attributes in both directions.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

system—To view this statement in the configuration.

direction (MX Series)

IN THIS SECTION

- Syntax | 5723
- Hierarchy Level | 5723
- Description | 5723
- Default | 5723
- Options | 5724
- Required Privilege Level | 5724

Release Information | 5724

Syntax

```
direction (inbound | outbound);
```

Hierarchy Level

```
[edit security macsec connectivity-association connectivity-association-name secure-channel
secure-channel-name]
```

Description

Configure whether the secure channel applies MACsec security to traffic entering or leaving an interface.

If you need to apply MACsec on traffic entering and leaving an interface, you need to create one secure channel to apply MACsec on incoming traffic and another secure channel to apply MACsec on outgoing traffic within the same connectivity association. When you associate the connectivity association with an interface, MACsec is applied on traffic entering and leaving that interface.

You only use this configuration option when you are configuring MACsec using static secure association keys (SAK) security mode. When you are configuring MACsec using static connectivity association keys (CAK) security mode, two secure channels that are not user-configurable—one inbound secure channel and one outbound secure channel—are automatically created within the connectivity association.

Default

This statement does not have a default value.

If you have configured a secure channel to enable MACsec using static SAK security mode, you must specify whether the secure channel applies MACsec to traffic entering or leaving an interface. A candidate configuration that contains a secure channel that has not configured a direction cannot be committed.

Options

inbound Enable MACsec security on traffic entering the interface that has applied the secure channel.

outbound Enable MACsec security on traffic leaving the interface that has applied the secure channel.

The remaining statements are explained separately.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1.

direction (Security Custom Attack)

IN THIS SECTION

- Syntax | 5725
- Hierarchy Level | 5725
- Description | 5725
- Options | 5725
- Required Privilege Level | 5725
- Release Information | 5725

Syntax

```
direction (any | client-to-server | server-to-client);
```

Hierarchy Level

```
[edit security idp custom-attack attack-name attack-type anomaly],

[edit security idp custom-attack attack-name attack-type signature]
```

Description

Define the connection direction of the attack.

Options

- `any`—Detect the attack in either direction.
- `client-to-server`—Detect the attack only in client-to-server traffic.
- `server-to-client`—Detect the attack only in server-to-client traffic.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.3.

direction (Security Dynamic Attack Group)

IN THIS SECTION

- Syntax | 5726
- Hierarchy Level | 5726
- Description | 5726
- Options | 5726
- Required Privilege Level | 5727
- Release Information | 5727

Syntax

```
direction {
    expression (and | or);
    values [any client-to-server exclude-any exclude-client-to-server exclude-server-to-client
server-to-client];
}
```

Hierarchy Level

```
[edit security idp dynamic-attack-group  dynamic-attack-group-name filters]
```

Description

Specify a direction filter to add predefined attacks to the dynamic group based on the direction specified in the attacks.

Options

`expression`—Boolean operators:

- `and`— If both the member name patterns match, the expression matches.

- `or`— If either of the member name patterns match, the expression matches.

`values`—Name of the direction filter. You can select from the following directions:

- `any`—Monitors traffic from client to server and server to client.
- `client-to-server`—Monitors traffic from client to server (most attacks occur over `client-to-server` connections) only.
- `exclude-any`—Allows traffic from client to server and server to client.
- `exclude-client-to-server`—Allows traffic from client to server only.
- `exclude-server-to-client`—Allows traffic from server to client only.
- `server-to-client`—Monitors traffic from server to client only.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.3. The `expression` option added in Junos OS Release 11.4.

direction (Service Data Flow Filters)

IN THIS SECTION

- Syntax | 5728
- Hierarchy Level | 5728
- Description | 5728
- Default | 5728
- Options | 5728
- Required Privilege Level | 5728
- Release Information | 5729

Syntax

```
direction (uplink | downlink | both);
```

Hierarchy Level

```
[edit unified-edge pcef flow-descriptions flow-identifier],
[edit services pcef flow-descriptions flow-identifier]
```

Description

Specify the direction in which service data flow (SDF) filters will detect service flow IP packets.

If you are using Junos OS Subscriber Aware, specify the direction at the `[edit unified-edge pcef flow-descriptions flow-identifier]` hierarchy level.

If you are using Junos OS Broadband Subscriber Management, specify the direction at the `[edit services pcef flow-descriptions flow-identifier]` hierarchy level.

Default

If you do not configure the `direction` statement, the default direction is `both`.

Options

uplink SDF filters are applied in the uplink direction.

downlink SDF filters are applied in the downlink direction.

both SDF filters are applied in both the uplink and downlink directions.

Required Privilege Level

For Junos OS Subscriber Aware:

unified-edge—To view this statement in the configuration.

unified-edge-control—To add this statement to the configuration.

For Junos OS Broadband Subscriber Management:

services—To view this statement in the configuration.

services-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.1.

Support at the `[edit services pcef flow-descriptions flow-identifier]` hierarchy level introduced for Junos OS Broadband Subscriber Management in Junos OS Release 17.2 on MX Series.

director-device (Aliases)

IN THIS SECTION

- Syntax | 5729
- Hierarchy Level | 5730
- Description | 5730
- Options | 5730
- Required Privilege Level | 5730
- Release Information | 5730

Syntax

```
director-device director-device-name {
    assigned-director-device-name;
}
```

Hierarchy Level

```
[edit fabric aliases]
```

Description

(QFabric systems only) Specify the mapping of user-defined names to QFabric system Director devices.

NOTE: The following rules apply to QFabric component alias naming:

- Alias names must use alphabetic (**A** through **Z** and **a** through **z**), numeric (**0** through **9**), or dash (**-**) characters.
- The maximum length of an alias name is 30 characters.
- Alias names are case sensitive. For example, **MY-NG-1** and **my-ng-1** refer to different components.
- You cannot use the reserved names `all`, `fabric`, or `director-group` as an alias name.

Options

director-device-name—Specify a user-defined name for a QFabric system Director device.

assigned-director-device-name—Specify the Director device identifier or name that has been provided. Identifiers are usually auto-generated by the Director software, and names are usually provided by the administrator of the default partition.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.2.

```
[edit protocols igmp-snooping vlan vlan-name]
```

Description

`disable (Protocols IGMP)`disables IGMP on the system.

`disable (Protocols SAP)`explicitly disables SAP.

`disable (Protocols MSDP)` explicitly disables MSDP.

`disable (Protocols MLD)`disables MLD on the system.

`disable (PIM Graceful Restart)`explicitly disables PIM sparse mode graceful restart.

`disable (Protocols DVMRP)`explicitly disables DVMRP on the system or on an interface.

`disable (PIM)`explicitly disable PIM at the protocol, interface or family hierarchy levels.

`disable (Multicast Snooping)`explicitly disables graceful restart for multicast snooping.

`disable (Protocols MLD Snooping)`disables MLD snooping on the VLAN. Multicast traffic will be flooded to all interfaces in the VLAN except the source interface.

`disable (IGMP Snooping)`disables IGMP snooping on the VLAN. Multicast traffic will be flooded to all interfaces on the VLAN except the source interface.

`disable (IGMP Snooping)`disables IGMP snooping on all interfaces in a VLAN.

Default

If you do not include this statement, MLD snooping is enabled on all interfaces in the VLAN.

If you do not include this statement in the configuration for a VLAN, IGMP snooping is enabled on the VLAN.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

`address (Local RPs)` and `disable (Protocols IGMP)` and `disable (Protocols SAP)` and `disable (PIM)` and `disable (Protocols MLD)` and `disable (Protocols MSDP)` introduced before Junos OS Release 7.4.

`address (Local RPs)` and `disable (Protocols IGMP)`introduced in Junos OS Release 9.0 for EX Series switches.

`disable (IGMP Snooping)`introduced in Junos OS Release 9.2 for EX Series switches.

disable statement extended to the **[family]** hierarchy level of disable (PIM) in Junos OS Release 9.6.

`disable (IGMP Snooping)` introduced in Junos OS Release 11.1 for the QFX Series.

`disable (MLD Snooping)` introduced in Junos OS Release 18.1R1 for the SRX1500 devices.

`address (Local RPs)` introduced in Junos OS Release 11.3 for the QFX Series.

`disable (Protocols IGMP)` and `disable (Protocols MLD Snooping)` and `disable (Protocols MSDP)`introduced in Junos OS Release 12.1 for the QFX Series.

`disable (Protocols MLD Snooping)`introduced in Junos OS Release 12.1 for EX Series switches.

`disable (Multicast Snooping)` introduced in Junos OS Release 12.3.

`address (Local RPs)` and `disable (Protocols MSDP)` introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

> **NOTE**: Distance Vector Multicast Routing Protocol (DVMRP) was deprecated in Junos OS Release 16.1. Although DVMRP commands continue to be available and configurable in the CLI, they are no longer visible and are scheduled for removal in a subsequent release.

Description

Use to enable a BGP peer that uses a 4-Byte to interact with another BGP peer old speaker that uses 2-Byte.

> **NOTE**: We recommend that you configure `disable-4byte-as` only if the BGP peer does not support or ignores the capability advertisement of 4byte-as, and brings up the session as a 2byte AS.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 19.3.

disable-action

IN THIS SECTION

- Syntax | 5743
- Hierarchy Level | 5744

Syntax

```
disable-all-instances;
```

Hierarchy Level

```
[edit forwarding-options port-mirror]
```

Description

Disable all port mirroring instances globally.

Usage Guidelines

See Configuring Port Mirroring on M, T MX, ACX, and PTX Series Routers.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.6.

disable (Application Tracking)

IN THIS SECTION

- Syntax | 5746
- Hierarchy Level | 5746
- Description | 5746
- Required Privilege Level | 5746

Release Information | 5746

Syntax

```
disable;
```

Hierarchy Level

```
[edit security application-tracking]
```

Description

Disable application tracking on a device without deleting the zone configuration.

Application tracking is enabled by default. If application tracking has been previously disabled and you want to reenable it, delete the configuration statement that specifies disabling of application tracking as shown in the following statement:

```
[edit]
user@host# delete security application-tracking disable
```

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.4.

disable (BGP Graceful Restart)

IN THIS SECTION

- Syntax | 5747
- Hierarchy Level | 5747
- Description | 5747
- Required Privilege Level | 5748
- Release Information | 5748

Syntax

```
disable;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols bgp graceful-restart],
[edit logical-systems logical-system-name protocols bgp group group-name graceful-restart],
[edit logical-systems logical-system-name protocols bgp group group-name neighbor address
graceful-restart],
[edit protocols bgp graceful-restart],
[edit protocols bgp group group-name graceful-restart],
[edit protocols bgp group group-name neighbor address graceful-restart]
```

Description

Disable graceful restart for BGP. Graceful restart allows a routing device undergoing a restart to inform its adjacent neighbors and peers of its condition.

NOTE: When you disable graceful restart at one level in the configuration statement hierarchy, it is also disabled at lower levels in the same hierarchy. For example, if you disable graceful restart at the `[edit protocols bgp group group-name]` hierarchy level, it is

disabled for all the peers in the group. Therefore, if you want to enable graceful restart for some peers in a group and disable it for others, enable graceful restart at the `[edit protocols bgp group group-name]` hierarchy level and disable graceful restart for each peer at the `[edit protocols bgp group group-name neighbor address]` hierarchy level.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

disable-failover-protocol (L2TP)

IN THIS SECTION

- Syntax | 5755
- Hierarchy Level | 5755
- Description | 5755
- Required Privilege Level | 5756
- Release Information | 5756

Syntax

```
disable-failover-protocol;
```

Hierarchy Level

```
[edit services l2tp]
```

Description

Configure the LAC or LNS to use only the silent failover method when resynchronizing with its peer in the event of a control plane failover. This statement prevents the default behavior, where the LAC first attempts to negotiate the failover protocol when it establishes control connections with the peer. If the remote peer does not support the failover protocol, then the LAC falls back on the silent failover method. Including this configuration is useful when the peers configured for silent failover or incorrectly negotiate use of the failover protocol even though they do not support it.

BEST PRACTICE: We recommend that you include this statement on both the LAC and LNS to prevent the use of failover protocol. When failover protocol is used, the nonfailed peer (LAC or LNS) keeps the tunnel open with the failed peer, in case the failed peer is able to recover from the failure and resynchronize with the nonfailed peer. This behavior keeps the tunnel up and the subscribers logged in while traffic is not flowing, preventing service level agreements from being met.

Starting in Junos OS Releases 15.1R6, 16.1R5, 16.2R2, 17.1R2, and 17.2R1, the `disable-failover-protocol` statement is deprecated and no longer needs to be used. The default failover resynchronization method is changed to silent failover, rather than the previous default method of failover-protocol-fall-back-to-silent-failover. The new default method conforms to our recommendation to use silent failover. Consequently, there is no need to disable the failover protocol. Configurations that include this statement are still supported when you upgrade to a release in which it is deprecated; The CLI informs you of the deprecation if the statement is included.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.2.

Statement deprecated in Junos OS Release 15.1R6, 16.1R5, 16.2R2, 17.1R2, and 17.2R1.

Change History Table

Feature support is determined by the platform and release you are using. Use Feature Explorer to determine if a feature is supported on your platform.

Release	Description
15.1R6	Starting in Junos OS Releases 15.1R6, 16.1R5, 16.2R2, 17.1R2, and 17.2R1, the `disable-failover-protocol` statement is deprecated and no longer needs to be used.

RELATED DOCUMENTATION

disable (Forwarding Options)

IN THIS SECTION

Syntax | 5757

- Hierarchy Level | 5757
- Description | 5757
- Required Privilege Level | 5757
- Release Information | 5758

Syntax

```
disable;
```

Hierarchy Level

```
[edit forwarding-options port-mirror],
[edit forwarding-options port-mirror instance instance-name],
[edit forwarding-options sampling],
[edit forwarding-options sampling instance instance-name],
[edit forwarding-options sampling family  (inet | inet6 | mpls | vpls) ],
[edit forwarding-options sampling family (inet | inet6 | mpls | vpls) output file]
```

Description

Disable traffic accounting, port mirroring, or sampling.

NOTE: The `disable` statement at the `[edit forwarding-options sampling]` hierarchy level disables only Routing Engine-based sampling. To disable PIC-based sampling and inline sampling, include the `disable` statement at the `[edit forwarding-options sampling instance instance-name]` hierarchy level.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Statement added to `port-mirror` hierarchy in Junos OS Release 9.6.

> **NOTE**: Beginning in Junos OS Release 15.1F5 and later 15.1 releases and Junos OS Release 16.1 and later, the `disable` option has been deprecated at the `forwarding-options sampling instance` *`instance-name`* `family (inet | inet6 | mpls)` hierarchy level on PTX3000 Series routers. When configured, the option does not take effect, so packets continue to be sampled. Instead of the `disable` option, use the `deactivate forwarding-options sampling instance` *`instance-name`* `family (inet | inet6 | mpls)` command to prevent sampling.

disable-grant-bypass

IN THIS SECTION

- Syntax | 5762
- Hierarchy Level | 5763
- Description | 5763
- Default | 5763
- Required Privilege Level | 5763
- Release Information | 5763

Syntax

```
disable-grant-bypass;
```

Hierarchy Level

```
[edit chassis fabric]
```

Description

Disable the fabric grant bypass feature. This feature is used for communication between Packet Forwarding Engines. For instance, when a Packet Forwarding Engine wants to send a packet to another Packet Forwarding Engine (on the same MPC or on a different MPC), a request is sent to the Packet Forwarding Engine across the fabric plane. Only after the request is granted, can the source Packet Forwarding Engine send the packet to the destination Packet Forwarding Engine. Disabling the default behavior controls congestion and thus improves system behavior and performance on MX2010 and MX2020 routers.

> **NOTE**: After disabling fabric grant bypass feature on the MX2010 and MX2020, you must reboot the router for the changes to take effect. MPC1 (MX-MPC1-3D), MPC2 (MX-MPC2-3D), and the 16-port 10-Gigabit Ethernet MPC (MPC-3D-16XGE-SFP) do not power on after you disable the fabric grant bypass feature and reboot the router.

Default

Enabled for all MPCs on MX2010 and MX2020 routers with Switch Fabric Boards (SFBs). On MX2010 and MX2020 routers with the Switch Fabric Board SFB2, this feature is enabled only on the MPCs, MPC1 (MX-MPC1-3D), MPC2 (MX-MPC2-3D), and the 16-port 10-Gigabit Ethernet MPC (MPC-3D-16XGE-SFP), and disabled on all other MPCs. The feature is disabled on routers with Switch Control Boards (SCBs).

Required Privilege Level

view

Release Information

Statement introduced in Junos OS Release 16.1.

disable (IGMP Snooping)

IN THIS SECTION

- Syntax | 5764
- Hierarchy Level | 5764
- Description | 5764
- Required Privilege Level | 5765
- Release Information | 5765

Syntax

```
disable;
```

Hierarchy Level

```
[edit protocols igmp-snooping vlan vlan-name]
```

Description

Disable IGMP snooping on the VLAN. Without IGMP snooping, multicast traffic will be flooded to all interfaces on the VLAN except the source interface.

This option is available only on legacy switches that do not support the Enhanced Layer 2 Software (ELS) configuration style. On these switches, IGMP snooping is enabled by default on all VLANs, and this statement includes the `disable` option if you want to disable IGMP snooping selectively on some VLANs or disable it on all VLANs.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.2.

RELATED DOCUMENTATION

Example: Configuring IGMP Snooping on Switches

disable (Interface)

IN THIS SECTION

- Syntax | 5765
- Hierarchy Level | 5766
- Description | 5766
- Required Privilege Level | 5767
- Release Information | 5767

Syntax

```
disable;
```

Hierarchy Level

```
[edit interfaces interface-name],
[edit interfaces interface-name unit logical-unit-number],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]
```

Description

Disable a physical or a logical interface, effectively unconfiguring it.

CAUTION:

- Dynamic subscribers and logical interfaces use physical interfaces for connection to the network. The Junos OS allows you to set the interface to disable and commit the change while dynamic subscribers and logical interfaces are still active. This action results in the loss of all subscriber connections on the interface. Use care when disabling interfaces.
- If aggregated SONET links are configured between a T1600 router and a T4000 router, interface traffic is disrupted when you disable the physical interface configured on the T1600 router. If you want to remove the interface, we recommend that you deactivate the interface instead of disabling it.

NOTE:

- When you use the `disable` statement at the `[edit interfaces]` hierarchy level, depending on the PIC type, the interface might or might not turn off the laser. Older PIC transceivers do not support turning off the laser, but newer Gigabit Ethernet (GE) PICs with SFP and XFP transceivers and ATM MIC with SFP do support it and the laser will be turned off when the interface is disabled. If the ATM MIC with SFP is part of an APS group, then the laser will not be turned off when you use the `disable` statement at the `[edit interfaces]` hierarchy level..
- When you disable or deactivate an interface, then all the references made to the deactivated interface must be removed from the routing instance.
- For abstracted fabric interfaces, the `disable` command disables AF interface on the local GNF only.

LASER WARNING: Do not stare into the laser beam or view it directly with optical instruments even if the interface has been disabled.

Starting in Junos OS Release 22.1R1, you can use the `disable` statement under `[edit interfaces interface-name]` and `[edit interfaces interface-name unit logical-unit-number]` hierarchy level to disable an IFD and IFL in PS interfaces on MX Series routers.

If you disable a PS IFD, then the IFD will be admin down and IFLs will do link down. If you disable a PS IFL, then the IFL will be admin down and link up.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

restarter],
[edit routing-instances routing-instance-name protocols bgp family (l2vpn | route-target | inet)
(labeled-unicast | flow) graceful-restart long-lived restarter],
[edit routing-instances routing-instance-name protocols bgp group group-name family (l2vpn |
route-target | inet) (labeled-unicast | flow) graceful-restart long-lived restarter],
[edit routing-instances routing-instance-name protocols bgp group group-name neighbor address
family (l2vpn | route-target | inet) (labeled-unicast | flow) graceful-restart long-lived
restarter]
```

NOTE: Each routing table is identified by the protocol family or address family indicator (AFI) and a subsequent address family identifier (SAFI). The AFI parameter can be one of the `(l2vpn | inet | route-target)` protocols and the SAFI parameter can be either of the `(flow | labeled-unicast)` protocols for inet family and one of the `(auto-discovery-mspw | auto-discovery-only | signaling)` protcols for L2VPN family..

Configuring LLGR does not require that BGP graceful restart also be configured. The long-lived-graceful-restart section is visible only for families l2vpn, inet labeled-unicast, inet flow and route-target. It is prohibited for inet-mvpn, inet6-mvpn and inet-mdt. It is hidden for other families.

Description

Disable the long-lived graceful restart capability for BGP sessions on the restarting router. A hidden `enable` attribute can be used to override an inherited disable attribute. Configuring graceful-restart long-lived restarter at the neighbor level (when it is not configured at the containing group level or globally) causes an internal group to be split.

When LLGR restarter is enabled or disabled for a family or the stale- time is changed, the session is reset so that the new capability can be sent to the neighbor.

The stanzas in the per-family graceful-restart long-lived restarter configuration section enables LLGR restarter mode negotiation for BGP globally, or for a group or neighbor. The values are inherited by groups from the global configuration, and by neighbors from the group configuration. The disable attribute is used to override configuration inherited from a higher level. It does not disable LLGR receiver mode; you must disable LLGR receiver mode explicitly for all families as necessary.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1.

disable (Multicast Load Balancing)

IN THIS SECTION

Syntax | 5774

- Hierarchy Level | 5774
- Description | 5774
- Required Privilege Level | 5774
- Release Information | 5774

Syntax

```
disable;
```

Hierarchy Level

```
[edit chassis multicast-loadbalance]
```

Description

(EX8200 switches only) Disable multicast load balancing. After you configure this statement and commit it, multicast load balancing no longer balances traffic on aggregated 10-gigabit Ethernet interfaces that are currently configured as well as those that are configured later.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.2 for EX Series switches.

RELATED DOCUMENTATION

disable (Multicast Snooping)

IN THIS SECTION

- Syntax | 5775
- Hierarchy Level | 5775
- Description | 5775
- Required Privilege Level | 5775
- Release Information | 5775

Syntax

```
disable;
```

Hierarchy Level

```
[edit multicast-snooping-options graceful-restart]
```

Description

Explicitly disable graceful restart for multicast snooping.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3.

disable-natt (Services IPsec VPN)

IN THIS SECTION

- Syntax | 5777
- Hierarchy Level | 5777
- Description | 5778
- Required Privilege Level | 5778
- Release Information | 5778

Syntax

```
disable-natt;
```

Hierarchy Level

```
[edit services ipsec-vpn]
```

Description

Before Junos OS Release 17.4R1, Network Address Translation-Traversal (NAT-T) is not supported for the Junos VPN Site Secure suite of IPsec features on the MX Series routers. In Junos OS releases before 17.4R1, disable NAT-traversal (NAT-T) when a NAT device is present between two IPsec gateways to cause the Encapsulating Security Payload (ESP) protocol to be used for encapsulation.

In traditional network deployments, IPsec does not work when packets traverse across a device that is configured for network address translation (NAT) or network address port translation (NAPT) for translating packets, IPsec does not work when either one of the device or both the devices that terminate the IPsec tunnel is behind a NAT device. This behavior occurs because NAT checks the port information, which is not present for IPsec-protected traffic.

When NAT-T is configured, IPsec traffic is encapsulated using the UDP header and port information is provided for the NAT devices. By default, Junos OS detects whether either one of the IPsec tunnel is behind a NAT device and automatically switches to using NAT-T for the protected traffic. However, in certain cases, NAT-T support on MX Series routers running a Junos OS Release before 17.4R1 might not work as desired. Also, you might require NAT-traversal to be disabled if you are aware that the network uses IPsec-aware NAT.

To avoid problems with NAT-T on MX series routers, you can disable NAT-T. When you disable NAT-T, the NAT-T functionality is globally switched off. Also, even when a NAT device is present between the two IPsec gateways, only ESP encapsulation is used when you disable NAT-T.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.1.

RELATED DOCUMENTATION

Disabling NAT-T on MX Series Routers for Handling NAT with IPsec-Protected Packets

disable-notification-extensions (BGP Graceful Restart)

IN THIS SECTION

- Syntax | 5779
- Hierarchy Level | 5779
- Description | 5780
- Required Privilege Level | 5780
- Release Information | 5780

Syntax

```
disable-notification-extensions {
    omit-no-export;
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols bgp graceful-restart],
[edit logical-systems logical-system-name protocols bgp group group-name graceful-restart],
[edit logical-systems logical-system-name protocols bgp group group-name neighbor address
graceful-restart],
[edit logical-systems logical-system-name routing-instances instance-name protocols bgp graceful-
restart],

group-name graceful-restart],
[edit logical-systems logical-system-name routing-instances instance-name protocols bgp group
group-name neighbor address graceful-restart],
[edit protocols bgp graceful-restart],
[edit protocols bgp group group-name graceful-restart],
[edit protocols bgp group group-name neighbor address graceful-restart]
```

Description

Disables the transmission of the N flag in the graceful restart capability negotiation, but in addition, it disables the new rules for invoking graceful restart receiver mode as specified in the IETF bgp-gr-notification draft, and disables the transmission of the Hard Reset subcode. The Hard Reset subcode is continued to be observed when received in a Notify or a Cease message. The BGP protocol sends a notification NOTIFICATION message and reset the peering session to handle the error condition. BGP graceful restart that permits the operational procedures to be performed when the BGP speaker receives a notification message.

You can define this setting at the `[edit protocols bgp graceful-restart]`, `[edit protocols bgp group group-name graceful-restart]`, or `[edit protocols bgp group group-name neighbor neighbor-address graceful-restart]` hierarchy level.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1.

RELATED DOCUMENTATION

Disabling PIM

family (Protocols PIM) | 6907

disable (PoE)

IN THIS SECTION

- Syntax | 5784
- Hierarchy Level | 5784
- Description | 5784
- Default | 5785
- Required Privilege Level | 5785
- Release Information | 5785

Syntax

```
disable;
```

Hierarchy Level

```
[edit poe interface  (all | interface-name) ]
 [edit poe interface (all | interface-name) telemetries]
```

Description

Disables the PoE capabilities of the port. If PoE capabilities are disabled for a port, the port operates as a standard network access port. If the disable statement is specified after the telemetries statement, logging of PoE power consumption for the port is disabled. To disable monitoring and retain the stored interval and duration values for possible future use, you can specify the disable sub statement in the sub

stanza for telemetries. Similarly for retaining the port configuration but disabling the PoE feature on the port, disable can be used in sub stanza for interface.

Default

The PoE capabilities are automatically enabled when a PoE interface is set. Specifying the telemetries statement enables monitoring of PoE per-port power consumption.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.5.

disable (Power over Ethernet)

IN THIS SECTION

- Syntax | 5785
- Hierarchy Level | 5786
- Description | 5786
- Required Privilege Level | 5786
- Release Information | 5786

Syntax

```
disable;
```

Hierarchy Level

```
[edit poe interface (all | all-extended | interface-name)],
[edit poe interface (all | all-extended | interface-name) telemetries],
[edit poe notification-control fpc slot-number]
```

Description

Disable a PoE interface, disable the collection of power consumption data for a PoE interface, or disable the generation of the PoE SNMP traps. The action of the `disable` statement depends on which statement it is used with:

- When used with **interface**—Disable the PoE capability of this interface. The interface operates as a standard network access interface, and power is no longer allocated to it from the PoE power budget. Although the PoE capability is disabled, the PoE configuration for the interface is retained. To reenable the PoE capability of this interface, delete the `disable` statement from the **interface** entry in the configuration.
- When used with **telemetries**—Disable the collection of PoE power consumption records for this interface. Any previously collected records are deleted. However, the **telemetries** configuration is retained, including the values for **interval** and **duration**. To reenable record collection, delete the `disable` statement from the **telemetries** entry in the configuration.
- When used with **notification-control**—Disable the generation of PoE SNMP traps. To reenable PoE traps, delete the `disable` statement from the **notification-control** entry in the configuration.

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.0.

all-extended option introduced in Junos OS Release 16.1R1.

disable-preceding-key

IN THIS SECTION

- Syntax | 5787
- Hierarchy Level | 5787
- Description | 5787
- Default | 5788
- Required Privilege Level | 5788
- Release Information | 5788

Syntax

```
disable-preceding-key;
```

Hierarchy Level

```
[edit security macsec connectivity-association connectivity-association-name]
```

Description

Disable the preceding pre-shared key (PSK) so that the fallback PSK is used to establish a MACsec connection during a pre-shared-key change event.

When you enable MACsec using static CAK security mode, a preshared PSK is exchanged between the devices on each end of the point-to-point Ethernet link. The PSK must match across devices for a MACsec session to be established. If the primary PSK is changed on one device but not the other, the

mismatch is resolved by using the older primary PSK. This is a temporary key known as the preceding PSK, and is not configurable.

If a fallback PSK is configured, it will not take effect if the MACsec session is live with the preceding PSK. You can configure the `disable-preceding-key` statement so that the session immediately switches to using the fallback PSK if there is a change to the primary PSK.

Default

By default, the preceding PSK takes priority over the fallback PSK. Configure the `disable-preceding-key` to override this behavior.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 19.2R1.

- Required Privilege Level | 5803
- Release Information | 5803

Syntax

```
disable-routing-engine;
```

Hierarchy Level

```
[edit system ddos-protection global],
[edit system ddos-protection protocols protocol-group (aggregate | packet-type)],
[edit system ddos-protection protocols protocol-group aggregate]
```

Description

(ACX Series routers, MX Series routers with only MPCs, T4000 Core Routers with only FPC5s, or EX9200 switches) Disable DDoS Routing Engine policers for debugging purposes for a particular packet type as follows:

- Within a protocol group—Use this option in the `protocols` statement hierarchy.
- Globally for all packet types in all protocol groups—Use this option in the `global` statement hierarchy.

This statement does not affect the state of the line card policers.

> **NOTE**: ACX Series routers only support aggregate policers and don't support policing at the line card level. Changes to default settings at the Routing Engine level propagate down to the Packet Forwarding Engine (PFE) chipset level. As a result, disabling Routing Engine policers globally on ACX Series routers effectively disables control plane DDoS protection on the device.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.2.

disable-timeout

IN THIS SECTION

Syntax | 5807

Hierarchy Level | 5807

- Description | 5807
- Default | 5807
- Options | 5808
- Required Privilege Level | 5808
- Release Information | 5808

Syntax

```
disable-timeout timeout;
```

Hierarchy Level

```
[edit ethernet-switching-options port-error-disable]
```

Description

Specify how long the Ethernet switching interfaces remain in a disabled state because of MAC limiting, MAC move limiting, or storm control errors.

> **NOTE**: If you modify the timeout value of an existing disable timeout setting, the new timeout value does not impact the timing of restoration to service of currently disabled interfaces that have been configured for automatic recovery. The new timeout value is applied only during the next occurrence of a port error.
>
> You can bring up the currently disabled interfaces by running the operational command `clear ethernet-switching port-error`.

Default

The disable timeout is not enabled.

Options

timeout—Time, in seconds, that the disabled state remains in effect. The disabled interface is automatically restored to service when the specified timeout value is reached.

- **Range:** 10 through 3600 seconds

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.6.

disable-timeout (BPDU)

IN THIS SECTION

- Syntax | 5809
- Hierarchy Level | 5809
- Description | 5809
- Default | 5809
- Options | 5809
- Required Privilege Level | 5809
- Release Information | 5810

Syntax

```
disable-timeout seconds;
```

Hierarchy Level

```
[edit protocols layer2-control bpdu-block]
```

```
[edit ethernet-switching-options                 bpdu-block]
```

Description

For interfaces configured for BPDU protection, specify the amount of time an interface receiving BPDUs is disabled.

Configure the timeout value to periodically check to see if an interface is still disabled with BPDU blocking. If this option is not configured, the interface is not periodically checked and remains disabled.

Default

The disable timeout is not enabled.

Options

seconds——Amount of time, in seconds, the interface receiving BPDUs is disabled. Once the timeout expires, the interface is brought back into service.

- **Range:** 10 through 3600
- **Default:** If this option is not configured, the interface is not periodically checked and remains disabled.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.1.

disable-timeout (Port Error Disable)

IN THIS SECTION

- Syntax | 5811
- Hierarchy Level | 5811
- Description | 5811
- Default | 5811
- Options | 5811
- Required Privilege Level | 5811
- Release Information | 5811

Syntax

```
disable-timeout timeout;
```

Hierarchy Level

```
[edit ethernet-switching-options  port-error-disable]
```

Description

Specify how long Ethernet switching interfaces remain in a disabled state due to MAC limiting, MAC move limiting, or storm control errors.

> **NOTE**: If you modify an existing timeout value, the new timeout value does not affect currently disabled interfaces are configured for automatic recovery. The new timeout value applies only to subsequent port errors. Run the `clear ethernet-switching port-error` command to restore currently disabled interfaces.

Default

The disable timeout statement is not enabled.

Options

timeout—Time, in seconds, that an interface remains disabled. The disabled interface automatically returns to service when the specified time expires.

- **Range:** 10 through 3600 seconds

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

```

Hierarchy Level

```
[edit services web-filter profile name url-filter-template]
```

Description

When you configure `disable-https-filtering`, the system permits or bypasses all HTTPS traffic. The TERM action takes priority over the `disable-https-filtering` command.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 24.3R1.

disable-packet-register

IN THIS SECTION

- Syntax | 5813
- Hierarchy Level | 5813
- Description | 5814
- Release Information | 5814

Syntax

```
disable-packet-register;
```

Hierarchy Level

```
[edit dynamic-profiles name protocols pim],
[edit logical-systems name protocols pim],
[edit logical-systems name routing-instances name protocols pim],
[edit logical-systems name tenants name routing-instances name protocols pim],
```

```
[edit protocols pim],
[edit routing-instances name protocols pim],
[edit tenants name routing-instances name protocols pim]
```

Description

Disable PIM packet registers on the first-hop router.

With PIM, the first-hop router (FHR) is the device connected to the PIM rendezvous point (RP). With the usual PIM behavior, the FHR encapsulates multicast packets in PIM register messages (which registers the source with the PIM RP) and sends the register messages to the PIM RP. The PIM RP registers the multicast (S,G) route, and decapsulates the multicast packets to forward them on to the receivers. After the RP has calculated and added the path to the source to its multicast routing tree, the RP sends a PIM register stop message toward the FHR.

Devices that might not be able to encapsulate (or decapsulate) multicast packets in PIM register messages will not generate the PIM register stop message. Without a PIM register stop message, the source registration process doesn't terminate properly. As a result, you can set this option on devices that act as FHRs to avoid keeping the PIM registration process in an unterminated state.

Release Information

Statement introduced in Junos OS Release 23.3R1.

discard (forwarding-options)

IN THIS SECTION

- Syntax | 5815
- Hierarchy Level | 5815
- Description | 5815
- Required Privilege Level | 5815
- Release Information | 5816

Syntax

```
discard {
    prefix-list-name prefix-list-name;
    source-ip-address-list address-list-name;
    source-mac-address-list address-list-name;
}
```

Hierarchy Level

```
[edit forwarding-options access-security router-advertisement-guard policy policy-name]
```

Description

Configure a discard policy for an IPv6 Router Advertisement (RA) guard policy. RA guard protects against rogue RA messages generated either maliciously or unintentionally by unauthorized or improperly configured routers connecting to the network segment. An RA guard policy is used to validate incoming RA messages on the basis of whether they match the conditions defined in the policy.

When RA guard is enabled, the switch compares the information contained in the attributes of RA messages to the criteria configured in the policy. When RA guard is enabled by using a discard policy, any RA messages that match the conditions defined in the policy are dropped, and RA messages that do not match the conditions are forwarded.

The criteria are configured as one or more lists of IPv6 addresses, MAC addresses, or IPv6 address prefixes associated with the policy. RA guard compares the source address or address prefix of incoming RA messages with the configured lists. You configure the lists at the [`edit policy-options`] hierarchy level, by using the `prefix-list` option for an IPv6 address or address prefix list, and the `mac-list` option for a MAC address list.

If more than one list is associated with a discard policy, then an incoming RA message that meets the criteria in any of the lists is discarded.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1X53-D55.

generate) (defaults | route)],
[edit routing-options (aggregate | generate) (defaults | route)],
[edit routing-options rib routing-table-name (aggregate | generate) (defaults | route)]
```

Description

Do not forward packets addressed to this destination. Instead, drop the packets, do not send ICMP unreachable messages to the packets' originators, and install a reject route for this destination into the routing table.

To propagate static routes into the routing protocols, include the `discard` statement when you define the route, along with a routing policy.

> **NOTE**: In other vendors' software, a common way to propagate static routes into routing protocols is to configure the routes so that the next-hop routing device is the loopback address (commonly, **127.0.0.1**). However, configuring static routes in this way (by including a statement such as **route *address/ mask-length* next-hop 127.0.0.1**) does not propagate the static routes, because the forwarding table ignores static routes whose next-hop routing device is the loopback address.

Default

When an aggregate route becomes active, it is installed in the routing table with a reject next hop, which means that ICMP unreachable messages are sent.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

- Release Information | 5829

Syntax

```
distinguished-name container container-string-values |wildcard wildcard-string-values
```

Hierarchy Level

```
[edit services ipsec-vpn ikepolicy policy-name local-id|remote-id
```

Description

Specify one or more distinguished name values.

A distinguished name is a name used with digital certificates to uniquely identify a user. For example a distinguished name can be:

- CN=user
- DC=example
- DC=com

Optionally, you can use the container keyword to specify that the order of the fields in a DN and their values exactly match the configured DN, or use the wildcard keyword to specify that the values of fields in a DN must match but the order of the fields does not matter.

Options

`container` *`container-string-values`* —One or more distinguished name container string.

`wildcard` *`wildcard-string-values`* —One or more distinguished name wildcard string.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

`distinguished-name` option added in Junos OS Release 19.1.

distinguished-name (Security)

IN THIS SECTION

- Syntax | 5831
- Hierarchy Level | 5831
- Description | 5832
- Options | 5832
- Required Privilege Level | 5832
- Release Information | 5832

Syntax

```
distinguished-name <container container-string> <wildcard wildcard-string>
```

Hierarchy Level

```
[edit security ike gateway gateway-name dynamic]
```

Description

Specify a distinguished name as the identifier for the remote gateway with a dynamic IP address.

Options

container-string

DN field and value to be matched. For example, `cn`=admin, `ou`=eng, `o`=example, `dc`=net. Specify one or more distinguished name (DN) field and value pairs that must match the DN in the VPN peer's digital certificate. The order of the fields and their values must exactly match the DN in the peer's digital certificate.

Add a space between each field and value pair. For example, `edit security ike gateway jsr_gateway dynamic distinguished-name container o=example, dc=net`.

wildcard-string

DN field and value pairs to be matched. For example, `cn`=admin, `ou`=eng, `o`=example, `dc`=net. Specify one or more distinguished name (DN) field and value pairs that must match the DN in the VPN peer's digital certificate. The configured field and value must match the DN in the peer's digital certificate but the order of the fields in the DN does not matter.

Add a space between each field and value pair. For example, `edit security ike gateway jsr_gateway dynamic distinguished-name wildcard o=example, dc=net`.

Starting in Junos OS Release 19.4R1, you can now configure only one dynamic DN attribute among `container-string` and `wildcard-string` at `[edit security ike gateway` *`gateway_name`* `dynamic distinguished-name]` hierarchy. If you try configuring the second attribute after you configure the first attribute, the first attribute is replaced with the second attribute. Before your upgrade your device, you must remove one of the attributes if you have configured both the attributes.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

[edit dynamic-profiles name protocols pim interface (Protocols PIM) interface-name],
[edit logical-systems name protocols pim interface (Protocols PIM) interface-name],
[edit logical-systems name routing-instances name protocols pim interface (Protocols PIM) interface-
name],
[edit protocols pim interface (Protocols PIM) interface-name],
[edit routing-instances name protocols pim interface (Protocols PIM) interface-name]
```

Description

Enable PIM distributed designated router (DR) functionality on IRB interfaces associated with EVPN virtual LANs (VLANs) that have been configured with IGMP snooping or MLD snooping. By effectively disabling certain PIM features that are not required in this scenario, this statement supports using PIM to perform intersubnet, that is, inter-VLAN, multicast routing more efficiently.

When you configure this statement on an interface on a device, PIM ignores the DR status of the interface when processing IGMP reports received on the interface. When the interface receives the IGMPor MLD report, the device sends PIM upstream join messages to pull the multicast stream and forward it to the interface regardless of the DR status of the interface. This setting also disables the PIM assert mechanism on the interface.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.2R1.

RELATED DOCUMENTATION

- Configure Multicast Forwarding with IGMP Snooping in an EVPN-MPLS Environment

distributed (IGMP)

IN THIS SECTION

- Syntax | 5835
- Hierarchy Level | 5835
- Description | 5835
- Required Privilege Level | 5835
- Release Information | 5835

Syntax

```
distributed;
```

Hierarchy Level

```
[edit protocols igmp interface interface-name],
[edit dynamic-profiles protocols igmp interface $junos-interface-name]
```

Description

Enable distributed IGMP by moving IGMP processing from the Routing Engine to the Packet Forwarding Engine. Distributed IGMP reduces the join and leave latency of IGMP memberships.

Distributed IGMP is only available when `chassis network-services enhanced-ip` is configured.

> **NOTE**: When you enable distributed IGMP, the following interface options are not supported on the Packet Forwarding Engine: `oif-map`, `group-limit`, `ssm-map`, and `static`. However, the `ssm-map-policy` option is supported on distributed IGMP interfaces. The `traceoptions` and `accounting` statements can only be enabled for IGMP operations still performed on the Routing Engine; they are not supported on the Packet Forwarding Engine. The `clear igmp membership` command is not supported when distributed IGMP is enabled.

When the `distributed` command is enabled in conjunction with mldp-inband-signalling, (so PIM act as a multipoint LDP inband edge router), it supports interconnecting separate PIM domains via a MPLS-based core.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.1X50.

Support added in Junos OS Release 18.2R1 for using `distributed` IGMP in conjunction with Multipoint LDP (mLDP) in-band signalling.

            }
        }
}
```

Hierarchy Level

```
[edit security alg sip]
```

Description

The `distribution-ip` configuration statement allows you to configure maximum of up to 20 IPv4 or IPv6 distribution IP addresses that enable SIP ALG to distribute the traffic based on the available IP addresses. Use the optional `fpc` and `pic` commands to add Flexible PIC Concentrator (FPC) card numbers and PIC card numbers to distribute the SIP traffic with IP address to the corresponding port. If the `fpc` and `pic` options are not configured, the SIP traffic with IP address distributes to the port decided by hash value of IP address.

Before configuring the `set security alg sip distribution-ip` *`ip-address`* `fpc` *`fpc-slot`* `pic` *`pic-slot`* command, perform the following steps:

- Use the `delete security alg sip distribution-ip` *`ip-address`* command to remove a specific IP address or use the `delete security alg sip distribution-ip` command to remove all the existing IP addresses.
- Use the `clear security nat incoming-table` command to remove the dynamically added IP addresses.

Options

fpc Flexible PIC Concentrator (FPC) card number.

fpc-slot FPC slot number.

- **Range:** 0 through 127

pic PIC card number.

pic-slot PIC slot number.

- **Range:** 0 through 3

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 18.1R1.

distribution-profile

IN THIS SECTION

- Syntax | 5838
- Hierarchy Level | 5839
- Description | 5839
- Options | 5840
- Required Privilege Level | 5840
- Release Information | 5840

Syntax

```
distribution-profile (fat-core | name) {
    description description;
    fpc fpc {
        pic pic {
            thread-id thread-id;
        }
    }
}
```

Hierarchy Level

```
[edit security]
```

Description

The `distribution-profile` option is introduced to give the administrator an option to define a profile to handle tunnels associated with a certain VPN object. If the default profiles such as `default-spc3-profile` or `default-spc2-profile` are not selected, a new user-defined profile can be created. In a profile, you should mention the Flexible PIC Concentrator (FPC) slot and the PIC slot. When this profile is associated with a VPN object, all matching tunnels will be distributed across these PICs. The `thread-id` is an optional value. If you specify a thread ID, then the tunnel is distributed in the specified thread.

Starting in Junos OS Release 20.2R1, when you add, change, or delete the thread ID from distribution profile, all tunnels part of modified distribution profile anchored on modified SPU member of distribution profile are teared down and re-negotiated. See Table 30 on page 5839 for catastrophic changes when you change the distribution profile configuration.

Table 30: Distribution Profile Catastrophic Change

Distribution Profile Change	Catastrophic Change
Add new distribution profile added to the VPN.	All tunnels part of this new distribution profile are brought down and re-negotiated.
Add new SPU information to a profile already part of the VPN.	No impact on any tunnel.
Delete SPU information from a distribution profile of the VPN.	Only those tunnels part of the distribution profile that is modified and anchored on a deleted SPU are brought down and re-negotiated.
Add first thread ID to an SPU part of the distribution profile.	All tunnels part of this distribution profile are brought down and re-negotiated.
Add next set of thread IDs to SPU part of the distribution profile.	No impact for any tunnel.

Table 30: Distribution Profile Catastrophic Change *(Continued)*

Distribution Profile Change	Catastrophic Change
Delete a thread ID from an SPU part of the distribution profile.	Only those tunnels part of the modified distribution profile and anchored on the deleted SPU are brought down and re-negotiated.
Delete last thread ID from SPU part of the distribution profile.	No impact on any tunnel.
Delete distribution profile from the VPN	No impact on any tunnel.
Change distribution profile name from profileA to profileB in VPN.	All tunnels part of this profile are brought down and re-negotiated.

Options

description Text description of the distribution profile.

fpc FPC slot number.

pic PIC slot number.

thread-id (Optional) Thread ID number. Only valid for SPC3.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 19.2R1.

dlb

IN THIS SECTION

- Syntax | 5841
- Hierarchy Level | 5841
- Description | 5841
- Options | 5842
- Required Privilege Level | 5842
- Release Information | 5842

Syntax

```
dlb {
    assigned-flow;
    per-packet;
    flowlet inactivity-interval;
    ether-type (Dynamic
       Load Balancing) (ipv4|ipv6|mpls);
}
```

Hierarchy Level

```
[edit interfaces aex aggregated-ether-options]
```

Description

Configure dynamic load balancing (DLB) on LAG with specific mode type—assigned flow, per-packet, or flowlet) and ether type—ipv4, ipv6, or mpls.

NOTE: Since ether-type is a global configuration and applicable to all LAGs in the system with DLB enabled, the CLI for specifying ether-type for LAG is added in the global

format under forwarding-options. See "ether-type (Dynamic Load Balancing)" on page 6473 for details.

NOTE: QFX switches in a virtual chassis configuration do not support dynamic load balancing.

Options

assigned-flow	Fixed link assignment.
per-packet	Per-packet link assignment.
flowlet ***inactivity-interval***	Minimum inactivity interval for link re-assignment. • **Range:** 16 through 65535 (in micro seconds).
ether-type ***(ipv4 | ipv6 | mpls)***	EtherType for DLB: • ipv4—Set dynamic load balancing for IPv4. • ipv6—Set dynamic load balancing for IPv6. • mpls—Set dynamic load balancing for MPLS.

Required Privilege Level

interface - To view this statement in the configuration.

interface-control - To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 19.4R1.

dns-filter

IN THIS SECTION

- Syntax | 5854
- Hierarchy Level | 5854
- Description | 5854
- Options | 5854
- Required Privilege Level | 5855
- Release Information | 5855

Syntax

```
dns-filter {
    database-file filename;
    dns-resp-ttl seconds;
    dns-server [ ip-address ];
    hash-key key-string;
    hash-method hash-method-name;
    statistics-log-timer minutes;
    wildcarding-level level;
}
```

Hierarchy Level

```
[edit services web-filter profile profile-name],
[edit services web-filter profile profile-name dns-filter-template template-name]
```

Description

Configure the settings for filtering DNS requests for disallowed website domains. Filtering can result in either:

- Blocking access to the site by sending the client a DNS response that includes an IP address or domain name of a sinkhole server instead of the disallowed domain.
- Logging the DNS request and allowing access.

Settings at the [edit services web-filter profile *profile-name* dns-filter-template *template-name*] hierarchy level override the corresponding settings at the [edit services web-filter profile *profile-name*] hierarchy level.

Options

database-file *filename*
: Name of the domain filter database file to use when filtering DNS requests.

dns-resp-ttl *seconds*
: Number of seconds to live while sending the DNS response after taking the DNS sinkhole action.

  - **Default:** 1800
  - **Range:** 0 through 86,400

dns-server [*ip-address*]
(Optional) IP addresses (IPv4 or IPv6) for up to three specific DNS servers. DNS filtering examines only DNS requests that are destined for those DNS servers.

hash-key *key-string*
Hash key that you used to create the hashed domain name in the domain filter database file.

hash-method *hash-method-name*
Hash method that you used to create the hashed domain name in the domain filter database file. The only supported hash method is `hmac-sha2-256`.

statistics-log-timer *minutes*
Number of minutes in the interval for logging statistics for DNS requests and for sinkhole actions performed for each customer IP address.

- **Default:** 5
- **Range:** 0 through 60

wildcarding-level *level*
Level of subdomains that are searched for a match. A value of 0 indicates that subdomains are not searched.

For example, if you set the `wildcarding-level` to 4 and the database file includes an entry for **example.com**, the following comparisons are made for a DNS request that arrives with the domain **198.51.100.0.example.com**:

- **198.51.100.0.example.com**: no match
- **51.100.0.example.com**: no match for one level down
- **100.0.example.com**: no match for two levels down
- **0.example.com**: no match for three levels down
- **example.com**: match for four levels down
- **Range:** 0 through 10

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 18.3R1 on MX Series.

Support added for Next Gen Services on MX Series routers MX240, MX480 and MX960 with MX-SPC3 services cards in Junos OS Release 19.3R2.

    client-routing-instance client-routing-instance-name;
    dns-filter {
        database-file filename;
        dns-resp-ttl seconds;
        dns-server [ ip-address ];
        hash-key key-string;
        hash-method hash-method-name;
        statistics-log-timer minutes;
        wildcarding-level level;
    }
    server-interfaces  [ server-interface-name ];
    server-routing-instance server-routing-instance-name;
```

```
    term term-name {
        from {
            src-ip-prefix [ source-prefix ];
        }
        then {
            accept;
            dns-sinkhole;
        }
    }
}
```

Hierarchy Level

```
[edit services web-filter profile profile-name]
```

Description

Configure filtering of DNS requests for disallowed website domains for requests on specific uplink and downlink logical interfaces or routing instances, or for requests from specific source IP address prefixes. The DNS filter template overrides the corresponding settings at the DNS profile level. You can configure up to 32 DNS filter templates in a profile.

Filtering can result in either:

- Blocking access to the site by sending the client a DNS response that includes an IP address or domain name of a sinkhole server instead of the disallowed domain.
- Logging the DNS request and allowing access.

Options

accept	Accept DNS requests for DNS filtering.
client-interfaces [*client-interface-name*]	(Optional) Client-facing (uplink) logical interfaces on which the DNS filter template settings are applied.
client-routing-instance *client-routing-instance-name*	(Optional) Client-facing (uplink) routing instance on which the DNS filter template settings are applied.
dns-filter-template *template-name*	Name of the DNS filter template.

dns-sinkhole Perform the sinkhole action identified in the domain filter database for disallowed DNS requests.

server-interfaces [*server-interface-name*] (Optional) Server-facing logical interfaces (downlink) on which the DNS filter template settings are applied.

server-routing-instance *server-routing-instance-name* (Optional) Server-facing (downlink) routing instance on which the DNS filter template settings are applied.

> **NOTE**: If you configure the client and server interfaces or the client and server routing instances, implicit filters are installed on the interfaces or routing instances to direct DNS traffic to the MS-MPC for DNS filtering. If you configure neither the client and server interfaces nor the routing instances, you must provide a way to direct DNS traffic to the MS-MPC (for example, via routes).

src-ip-prefix [*source-prefix*] (Optional) Source IP address prefixes of DNS requests you want to filter. You can configure a maximum of 64 prefixes in a term. If you do not specify any source prefixes, then all DNS requests are filtered.

term *term-name* Name for a term. You can configure a maximum of 64 terms in a template.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 18.3R1 on MX Series.

Support added in Junos OS Release 19.3R2 for Next Gen Services on MX Series routers MX240, MX480 and MX960 with the MX-SPC3 services card.

        no-remote-trace;
```

```
    }
}
```

Hierarchy Level

```
[edit services]
```

Description

Configure DNS filtering to identify DNS requests for disallowed domains.

NOTE: The DNS sinkhole must be configured only for DNS profile category.

Options

dns-resp-ttl Configure the time-to-live (TTL) value in seconds to send_IN_the DNS response after taking the DNS sinkhole action. The maximum value for DNS response TTL is 86400 (24 hour). Default value is 1800 (30 min).

fqdn Configure the fully qualified domain name (FQDN) that must be sent in the DNS response for the sinkhole domains.

ipv4-address Configure the sinkhole IPv4 address.

ipv6-address Configure the sinkhole IPv6 address.

srv-resp-err-code Configure the DNS response error code that must be sent for bad domains for server query type.

txt-resp-err-code Configure the DNS response error code that must be sent for bad domains for text query type.

wildcarding-level Configure the number of levels that will be iteratively examined for a domain match. The range is 0 to 10. The default value is 10.

file Configure traffic sampling tracing operations. You can configure the following:

- file-name—Specify the file name in which to write trace information.

- files—Specify the maximum number of trace files to be saved with samples or trace data. The range is 2 to 1000.
- match—Specify the regular expression for lines to be logged for tracing.
- size—Specify the maximum trace file size, in kilobytes (KB), megabytes (MB), or gigabytes (GB). Syntax: xk to specify KB, xm to specify MB, or xg to specify GB. The range is 10240 to 1073741824.
- no-world-readable—Disable unrestricted file access.
- world-readable—Enable unrestricted file access. Allows any user to read the log file.

flag

Tracing flag parameters. The available options are:

- all—Trace everything
- config—Trace DNS filtering configuration events
- connect—Trace DNS filtering IPC events
- dns—Trace DNS filtering crawler events
- filter—Trace DNS filtering filter programming events
- gencfg—Trace DNS filtering gencfg events
- normal— Trace normal events
- operation-commands—Trace DNS filtering show events
- parse—Trace DNS filtering parse events
- routing—Trace DNS filtering route programming events
- snmp— Trace DNS filtering snmp events
- statistics—Trace DNS filtering statistics events
- system—Trace DNS filtering system events
- timer—Trace DNS filtering timer events

level

Level of debugging output. The available options are:

- all—Match all levels

- error—Match error conditions
- info—Match informational messages
- notice—Match conditions that should be handled specially
- verbose—Match verbose messages
- warning—Match warning messages

no-remote-trace Disable remote tracing.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Command introduced in Junos OS Release 20.4R1.

dns-proxy

IN THIS SECTION

- Syntax | 5863
- Hierarchy Level | 5863
- Description | 5863
- Options | 5863
- Required Privilege Level | 5863

```

Description

Specify the address of the DNS server that is used to resolve IPv6 DNS names. You can use RADIUS to provide the address dynamically in the $junos-ipv6-dns-server variable within Access-Accept messages, or you can statically configure up to three IPv6 addresses.

You can also specify the maximum time in seconds for which the DNS server address remains valid. The device can use the recursive DNS server address for DNS name resolution until the time specified expires.

Options

$junos-ipv6-dns-server-address
Dynamically receive the address of the DNS server from RADIUS in Access-Accept messages.

dns-server-address
IPv6 address of the DNS server. You can configure up to three DNS server addresses.

lifetime *seconds*
Maximum time for which the recursive DNS server address remains valid.

- **Range:** 0 through 4,294,967,295 seconds
- **Default:** 1800 seconds
- **Values:** 0 indicates that the advertised recursive DNS server address is no longer valid and that this recursive DNS server address entry can be deleted.

  A value of 4,294,967,295 seconds indicates an infinite lifetime and a persistent entry in the device for this recursive DNS server address.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.1.

DNS Overview

dnssec

IN THIS SECTION

- Syntax | 5870
- Hierarchy Level | 5870
- Description | 5870
- Options | 5870

Required Privilege Level | 5871
Release Information | 5871

Syntax

```
dnssec {
    disable;
    dlv {
        domain-name domain-name trusted-anchor  trusted-anchor;
        }
secure-domains domain-name;
    trusted-keys {
        (key dns-key | load-key-file url);
    }
```

Hierarchy Level

```
[edit system services dns]
```

Description

Configure domain name service security extensions (DNSSEC) in the DNS server. DNSSEC is an extension of DNS that provides authentication and integrity verification of data by using public-key-based signatures.

Options

disable

Disable DNSSEC.

- **Default:** DNSSEC is enabled.

secure-domains [*domain-name*]

Configure one or more secure domains in the DNS server. The server accepts only signed responses for this domain. For unsigned responses, the server returns SERVFAIL error to the client.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Release 10.2 of Junos OS.

do-not-fragment

IN THIS SECTION

- Syntax | 5871
- Hierarchy Level | 5872
- Description | 5872
- Default | 5872
- Required Privilege Level | 5872
- Release Information | 5872

Syntax

```
do-not-fragment;
```

Hierarchy Level

```
[edit interfaces gr-fpc/pic/port unit logical-unit-number tunnel],
[edit logical-systems logical-system-name interfaces gr-fpc/pic/port unit logical-unit-number
tunnel]
```

Description

For a generic routing encapsulation (GRE) tunnel, disable fragmentation of GRE-encapsulated packets. This sets the do-not-fragment (DF) bit in the outer IP header of the GRE-encapsulated packets so that they do not get fragmented anywhere in the path. When the size of a GRE-encapsulated packet is greater than the MTU of a link that the packet passes through, the GRE-encapsulated packet is dropped.

Default

By default, fragmentation of GRE-encapsulated packets is disabled.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.2.

Statement introduced in Junos OS Release 19.3 for MPC10E line card.

domain-path-id

IN THIS SECTION

- Syntax | 5895
- Hierarchy Level | 5895
- Description | 5895
- Required Privilege Level | 5896
- Options | 5896
- Release Information | 5897

Syntax

```
[edit routing-options]
 domain-path-id {
     <domain-id-string>;
 }
```

Hierarchy Level

```
[edit routing-options]
```

Description

NOTE: In Junos OS Release 22.2R1 and 22.3R1, and Junos OS Evolved Releases and 22.2R1 and 22.3R1, the `dpath-domain-id` statement was called `uniform-propagation-mode` with a `domain-id` option. The `uniform-propagation-mode` statement with the `domain-id` option has the same functionality as the `dpath-domain-id` statement.

Starting in Junos OS Release 22.3R2 and Junos OS Evolved Release 22.3R2, the `dpath-domain-id` statement is now called `domain-path-id`.

Starting in Junos OS Release 23.2R1 and Junos OS Evolved Release 23.2R1, the domain-path-id is neither exported nor imported by default. Refer to "domain-path-id (Protocols BGP)" on page 5898 for more information.

When you configure the `domain-path-id` statement on a gateway provider edge (PE) device, you're enabling the BGP D-PATH attribute for all of the gateway PE's virtual routing and forwarding (VRF) instances. You can use the BGP D-PATH attribute for intersubnet forwarding (ISF) and subsequent address family identifiers (SAFIs) that advertise IP prefix routes. The BGP D-PATH attribute supports EVPN Type 5 and IP-VPN routes.

The BGP D-PATH attribute enables a gateway provider edge (PE) device to add a domain ID to a BGP route. In many situations, a tenant system is located in different data centers, where an IP Virtual Private Network (IP-VPN) is configured in the WAN. In this situation, gateway PEs aren't aware of the domains they traverse and can install suboptimal routes or routing loops in their IP virtual routing and forwarding (IP-VRF) tables. Gateway PEs can then send BGP updates that advertise those routes to other gateway PEs.

The BGP D-PATH attribute extends its path selection algorithm to prevent routing loops. This attribute also ensures that the gateway PEs install the best routes in their IP-VRF tables. When a gateway PE receives an ISF route, it imports the route into its IP-VRF table and adds the BGP D-PATH attribute to its existing path attributes. The gateway PE uses the information in the BGP D-PATH attribute and the ISF routes in its IP-VRF table to identify the domains through which EVPN IP prefix routes and IP-VPN routes have traversed. With this information, the gateway PE determines if a route should be installed in its IP-VRF table. If the route forms a loop, the gateway PE doesn't install the route in its IP-VRF table.

The BGP D-PATH attribute contains a sequence of domain segments. Each domain segment includes the following fields:

- Domain segment length

  This segment is a 1-octet field that contains the number of domains in a domain segment.

- Domain ID

  This segment is a 6-octet field that represents a particular domain. This segment also contains a 4-octet global administrator sub-field and a 2-octet local administrator sub-field. The global administrator sub-field can contain an AS number, an IPv4 address, or any other value that guarantees the uniqueness of the domain ID.

- ISF_SAFI_TYPE

  This segment is a 1-octet field that identifies the ISF route and the SAFI.

  Table 31: ISF_SAFI Types and Values

ISF_SAFI Types	Values
IPVPN (SAFI 128)	128
EVPN (SAFI 128)	70

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Options

domain-id-string—(Required) Specify the domain ID type and value.

NOTE: You can configure only two domain IDs.

The domain ID contains the following elements:

- Autonomous system (AS) number, IPv4 address, or 4-octet value.

  NOTE: If you use a 4-octet value instead of the AS number or IPv4 value, the value needs to be unique.

- Local administration subfield.

  Configure a local 2-octet value between 0 to 65535 (0xFFFF) for your local data center.

- Inter-subnet forwarding identifier (ISF).
- Subsequent address family identifier (SAFI).

Use this format to create the domain ID type: `<ASN | IPv4 address | 4-octet value>:local administration subfield:ISF_SAFI_TYPE`.

Here's an example that configures two EVPN ISF_SAFI_TYPE domain IDs with AS number 6500, and local administration subfields 1 and 2 for ISF_SAFI types EVPN and IPVPN, respectively:

```
domain-path-id {
    6500:1:evpn;
    6500:2:ipvpn;
}
```

Release Information

Statement introduced in Junos OS Release 22.2R1.

domain-path-id (Protocols BGP)

IN THIS SECTION

- Syntax | 5898
- Hierarchy Level | 5898
- Description | 5898
- Options | 5899
- Required Privilege Level | 5899
- Release Information | 5899

Syntax

```
domain-path-id {
 receive;
 send;
}
```

Hierarchy Level

```
[edit protocols bgp],
[edit protocols bgp group group-name],
[edit protocols bgp group group-name neighbor neighbor-address],
[edit routing-instances instance-name protocols bgp],
[edit routing-instances instance-name protocols bgp group group-name],
[edit routing-instances instance-name protocols bgp group group-name neighbor neighbor-address]
```

Description

You can use the `receive` statement to control importing the BGP domain path attribute. You can use the `send` statement to control exporting the BGP domain path attribute. The BGP domain path attribute is not exported or imported by default.

Options

receive Allow receiving BGP domain path attribute

send Allow sending BGP domain path attribute

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

`receive` statement introduced in Junos OS and Junos OS Evolved Release 23.2R1.

`send` statement introduced in Junos OS and Junos OS Evolved Release 23.2R1.

domain-search

IN THIS SECTION

- Syntax | 5900
- Hierarchy Level | 5900
- Description | 5900
- Options | 5900
- Required Privilege Level | 5900
- Release Information | 5901

Syntax

```
domain-search [domain-list ];
```

Hierarchy Level

```
[edit system],
[edit system services dhcp],
[edit system services dhcp],
[edit system services dhcp pool],
[edit system services dhcp static-binding]
```

Description

Configure a list of domains to search (in the case where you want to configure access to multiple DNS servers for redundancy, and/or to resolve hosts that the previous server could not).

Options

domain-list List of domain servers to search. The list can contain up to six domain names, separated by a space, with a total of up to 256 characters.

For example to search `domain1.net`, and if it fails to resolve the host, `domain2.net`, and if fails to resolve the host, `domain3.net`, you would configure the following domain list at the `domain-search` hierarchy level:

```
[edit system]
set domain-search [domain1.net domain2.net domain3.net]
```

NOTE: In gNMI, the user cannot delete individual domain lists. The entire domain search command, including all the configured domain lists, must be deleted.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

            pcef-profile pcef-profile-name;
        }
    }
}
```

Hierarchy Level

```
[edit unified-edge gateways tdf gateway-name]
```

Description

Specify the TDF domain to be used for an IP-based subscriber. You can configure multiple terms under `domain-selection`, and each term is applied in the order in which it is configured. You can specify multiple match conditions within a term and all of the conditions have to match. If the incoming RADIUS request from the subscriber matches the criteria in a term, then the TDF domain specified in the `then` statement of the term is used to create the TDF subscriber.

You can also specify a PCEF profile for an IP-based subscriber. This is required if the TDF domain selected for a subscriber does not specify a PCEF profile or you want to allow different members of the same TDF domain to have different PCEF profiles.

After a term matches and a TDF domain is selected, further terms are not evaluated if the PCEF profile is specified in either the `then` statement or in the selected TDF domain. If a PCEF profile is not specified in either the `then` statement or in the selected TDF domain, further terms are evaluated to find a PCEF profile for the subscriber.

If no TDF domain is selected for a subscriber, then a TDF subscriber session is not created.

> **NOTE**: The TDF domain must have been previously configured at the `[edit unified-edge gateways tdf` *`gateway-name`* `domains]` hierarchy level.
>
> The PCEF profile must have been previously configured at the `[edit unified-edge pcef]` hierarchy level.

The remaining statements are explained separately. See CLI Explorer.

```
[edit bridge-domains bridge-domain-name],
[edit logical-systems logical-system-name routing-instances routing-instance-name bridge-domains
bridge-domain-name],
[edit routing-instances routing-instance-name bridge-domains bridge-domain-name]
```

SRX Series

```
[edit bridge-domains bridge-domain-name]
```

Description

Define the domain type `bridge` for a Layer 2 bridge domain.

NOTE: There is only one domain type `bridge`, that can be configured on SRX Series Firewalls. Domain type `bridge` is not enabled by default. An SRX Series Firewall operates in the Layer 2 transparent mode when all physical bridge domains on the device are partitioned into logical bridge domains.

NOTE: Starting with Junos OS Release 15.1X49-D10 and Junos OS Release 17.3R1, the CLI `domain-type` is not available.

> **NOTE**: Starting in Junos OS Release 15.1X49-D10 and Junos OS Release 17.3R1, the hierarchy `[edit bridge-domains bridge-domain-name]` is renamed to `[edit vlans vlan-name]`. For detailed information about the modified hierarchies, see *Enhanced Layer 2 CLI Configuration Statement and Command Changes for Security Devices*.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.4.

Statement modified in Junos OS Release 9.5.

Support for logical systems added in Junos OS Release 9.6.

- Syntax | 5912
- Hierarchy Level | 5912
- Description | 5913
- Default | 5913
- Required Privilege Level | 5913
- Release Information | 5913

Syntax

```
dont-help-shared-fate-bfd-down
```

Hierarchy Level

```
[edit protocols bgp graceful-restart]
```

Description

When BFD is control plane dependent and the device detects a BFD down event and is not already entering the graceful restart helper mode, this is treated as a regular BFD down event and the device enters the graceful restart helper mode. This behavior makes the control plane dependent BFD unusable in conjunction with graceful restart.

Include the `dont-help-shared-fate-bfd-down` statement at the `[edit protocols bgp graceful-restart]` hierarchy to ensures that the device does not enter the graceful restart helper mode and data traffic continues to be fowarded to an alternate path even if there is an interface failure (without a control plane restart on the BGP neighbor).

Default

By default, this option is not enabled.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 18.3R1.

Statement introduced in Junos OS Release 14.2.

downlink-dscp-to-egress-forwarding-class

IN THIS SECTION

- Syntax | 5922
- Hierarchy Level | 5922
- Description | 5923
- Required Privilege Level | 5923
- Release Information | 5923

Syntax

```
downlink-dscp-to-egress-forwarding-class {
    classifier classifier-name;
    classifier classifier-name; {
        routing-instance instance-name;
    }
}
```

Hierarchy Level

```
[edit services mobile-edge gateways saegw system class-of-service]
```

Description

You will use these classifiers to map DiffServ code point (DSCP) values provided in Transport Level Marking (TLM) to specific forwarding/egress classes on the WAN interface.

The Egress Forwarding Class will be assigned to the Service Data Flow (SDF). All packets matching that SDF inherit the forwarding class. If the Egress Forwarding Class is not assigned to the SDF, the forwarding class assigned by the ingress WAN classifier will be used.

To assign Egress Forwarding Classes to an SDF, Transport Level Marking (TLM) must be provided. If the Fowarding Action (FAR) does not include TLM, the Egress Forwarding Class will not be assigned.

Required Privilege Level

system

Release Information

This statement was introduced in Junos OS Release 23.1R1.

downlink-dscp-to-forwarding-class

IN THIS SECTION

- Syntax | 5923
- Hierarchy Level | 5924
- Description | 5924
- Required Privilege Level | 5924
- Release Information | 5924

Syntax

```
downlink-dscp-to-forwarding-class {
    classifier classifier-name;
    classifier classifier-name {
```

```
        routing-instance instance-name;
    }
}
```

Hierarchy Level

```
[edit services mobile-edge gateways saegw system class-of-service]
```

Description

Assign the classifiers to use for mapping the DiffServ code point (DSCP) value provided in the Transport Level Marking to the forwarding queues.

The DSCP value is relevant in the context of the routing instance associated with the outgoing interface. Therefore, you need to assign classifiers to peer routing instances. If you do not assign any routing instance to a classifier, the system uses the classifier for all routing instances without an assigned classifier.

See CLI Explorer for the remaining statements.

Required Privilege Level

system

Release Information

Juniper Networks introduced this statement in Junos OS Release 22.2R1.

download (Services)

IN THIS SECTION

- Syntax | 5928
- Hierarchy Level | 5929
- Description | 5929
- Options | 5929
- Required Privilege Level | 5929
- Release Information | 5930

Syntax

```
download {
    automatic {
        interval hours;
        minor-only;
        start-time start-time;
    }
    ignore-server-validation;
    proxy-profile proxy-profile;
    url url;
}
```

Hierarchy Level

```
[edit services application-identification]
```

Description

Configure automatic download for the application identification services application package.

The application package contains definitions for known applications, such as: DNS, Facebook, FTP, Skype, and SNMP. The application package is located at **https://signatures.juniper.net**. If you do not have access to the default download site from your device, you can use the URL option to download from a different location.

> **NOTE**: You need to download the application package before configuring application identification services.

Options

automatic Download the application package automatically at a certain time of day or at intervals.

- *interval*—Download the application package at intervals.

  Range: 6 through 720 hours

- minor-only—Specify signature package version type as minor.
- *start-time*—Start time in which the application package will be download. Format is MM-DD.hh:mm. Example: 04-15.09:00 will start the download on April 15 at 9 AM.

ignore-server-validation Disable server authentication for Applicaton Signature download

proxy-profile Configure web proxy for Application signature download

url URL for application package download. Use this option to change the default download location of the application package.

Syntax

```
downstream-on-demand;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols ldp session session-address],
[edit protocols ldp session session-address]
```

Description

Enable LDP downstream on demand on the LDP session. LDP is widely deployed in downstream unsolicited advertisement mode. As service providers integrate the access and aggregation networks into a single MPLS domain, LDP downstream on demand is needed to distribute the bindings between access and aggregation networks to minimize the workload for the access node (AN) control plane and to avoid the storage of tens of thousands of label bindings from upstream aggregation nodes.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.2.

downstream-rate (Traffic Shaping)

IN THIS SECTION

- Syntax | 5936
- Hierarchy Level | 5936
- Description | 5936
- Options | 5936
- Required Privilege Level | 5936
- Release Information | 5936

Syntax

```
downstream-rate rate;
```

Hierarchy Level

```
[edit dynamic-profiles profile-name interfaces $junos-interface-ifd-name unit $junos-interface-
unit advisory-options],
[edit dynamic-profiles profile-name interfaces interface-set $junos-interface-set-name interface
$junos-interface-ifd-name advisory-options],
[edit interfaces demux0 unit logical-unit-number advisory-options],
[edit interfaces interface-name unit logical-unit-number advisory-options]
```

Description

Specify a recommended shaping rate to be applied to downstream traffic on an interface.

For ANCP interfaces, this configured rate is used as the default value for the Juniper VSA Downstream-Calculated-Qos-Rate (26–141) when the router has not received and processed the attributes from the access node.

For L2TP, the rate is configured on an underlying PPPoE logical interface for a subscriber on an MX Series router acting as a LAC. When the subscriber is tunneled, this rate, referred to as speed for L2TP, is sent to the LNS in the ICCN message as AVP 24.

Options

rate—Traffic rate in bits per second.

- **Range:** 1000 through 4,294,967,295 bits per second

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

draining (Diameter Applications)

IN THIS SECTION

- Syntax | 5941
- Hierarchy Level | 5941
- Description | 5942
- Required Privilege Level | 5942
- Release Information | 5942

Syntax

```
draining;
```

Hierarchy Level

```
[edit access pcrf partition partition-name],
[edit access ocs partition partition-name]
```

Description

Configure the Policy and Charging Rule Function (PCRF) or Online Charging System (OCS) partition to the draining state to make substantial configuration changes quickly. To log out all subscribers quickly and immediately, issue the `clear network-access pcrf subscribers` command.

After you set draining for either of the PCRF or OCS partitions, any new subscriber logins are denied, and the time limit you set in the `draining-response-timeout` statement is used instead of the `logout-response-timeout` time limit.

After the partition has drained, you must issue the `clear network-access pcrf` or `clear network-access ocs statistics` command to clear out the respective partition's subscribers and wait for all of the subscribers to log out before you can make configuration changes and resume normal operations.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

```

Description

Drop (discard) specified DHCP client packets when you use DHCP relay agent selective processing. You can configure the drop operation globally or for a group of interfaces, and for either DHCP or DHCPv6 relay agent.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3.

RELATED DOCUMENTATION

drop-flow

IN THIS SECTION

- Syntax | 5948
- Hierarchy Level | 5948
- Description | 5948
- Options | 5948
- Required Privilege Level | 5948
- Release Information | 5949

Syntax

```
drop-flow {
 max-sessions percent;
 timeout seconds;
}
```

Hierarchy Level

```
[edit security flow]
```

Description

To prevent the probable security attack, we introduce `drop-flow` configuration. Sessions in the drop-flow is valid for 4 seconds by default.

Options

max-sessions

Maximum Drop-flow Sessions (default 10%) (percent)

- **Default:** 10
- **Range:** 0 through 30

timeout

Timeout (default 4s) (seconds)

- **Default:** 4
- **Range:** 2 through 300

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

This statement is introduced in Junos OS Release 23.3R1.

drop-member-traffic (Aggregated Multiservices)

IN THIS SECTION

- Syntax | 5949
- Hierarchy Level | 5949
- Description | 5949
- Default | 5950
- Required Privilege Level | 5950
- Release Information | 5950

Syntax

```
drop-member-traffic {
    rejoin-timeout rejoin-timeout;
}
```

Hierarchy Level

```
[edit interfaces interface-name load-balancing-options member-failure-options]
```

Description

Specify whether the broadband gateway should drop traffic to a services PIC when it fails.

For many-to-one (N:1) high availability (HA) for service applications like Network Address Translation (NAT), this configuration is valid only when two or more services PICs have failed.

The remaining statement is explained separately. See CLI Explorer.

Default

If this statement is not configured, then the default behavior is to drop member traffic with a rejoin timeout of 120 seconds.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.4.

Support added in Junos OS Release 19.3R2 for Next Gen Services on MX Series routers MX240, MX480 and MX960 with the MX-SPC3 services card.

```

QFX10000 Switches

```
drop-probability percentage1 percentage2 ... percentage32;
```

Hierarchy Level

```
[edit class-of-service drop-profiles profile-name interpolate]
```

Description

When configuring WRED, map the packet `drop-probability` to the fullness of a queue ("fill-level" on page 7110). You configure the `fill-level` and `drop-probability` statements in related pairs. The pairs of fill level and drop probability values set a probability of dropping packets at a specified queue fullness value.

On switches that support only two fill level/drop probability pairs, the first drop probability is always zero. The first fill level/drop probability pair sets the drop start point, and the second fill level/drop probability pair sets the drop end point.

On switches that support 32 fill level/drop probability pairs, the first fill level/drop probability pair sets the drop start point, and the last fill level/drop probability pair sets the drop end point.

As the queue fills from the drop start point to the drop end point, the rate of packet drop increases in a curve pattern. The higher the queue fill level, the higher the probability of dropping packets.

Options

0 (switches that support only two fill level/drop probability pairs)—Probability that packets will drop at the lowest `fill-level` value. This is always zero, because until the queue reaches the specified low `fill-level` value, no packets are scheduled to drop.

- **Range:** 0

high-value (switches that support only two fill level/drop probability pairs)—The maximum probability that packets will drop before queue fullness exceeds the high value of the queue `fill-level`, expressed as a percentage. If the queue fills beyond the high `fill-level` value, all packets drop.

- **Range:** 0 through 100 percent

percentage1 percentage2 ... percentage32 (switches that support 32 fill level/drop probability pairs)—The probability that packets will drop before the queue fullness exceeds the `fill-level` value, expressed

as a percentage. Each drop probability pairs with a queue fill level to define the probability of a packet dropping at a specified queue fullness.

- **Range:** 0 through 100 percent

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.1.

drop-probability (Fill Level)

Example: Configuring Drop Profile Maps

drop-profile (Dynamic Schedulers)

IN THIS SECTION

- Syntax | 5961
- Hierarchy Level | 5961
- Description | 5961
- Options | 5961
- Required Privilege Level | 5962
- Release Information | 5962

Syntax

```
drop-profile (profile-name | predefined-variable);
```

Hierarchy Level

```
[edit dynamic-profiles profile-name class-of-service schedulers scheduler-name drop-profile-map loss-
priority (any | low | medium-low | medium-high | high) protocol (any | non-tcp | tcp)]
```

Description

Within the drop-profile map, specify the name of the drop profile to use for random early detection (RED) for a specific packet-loss priority (PLP) level and protocol type. A drop profile maps a fill level (fullness of a queue) to a drop probability (probability that a packet will be dropped). When a packet arrives, RED checks the queue fill level. If the fill level corresponds to a nonzero drop probability, the RED algorithm determines whether to drop the arriving packet.

You enable RED by applying a drop profile to a scheduler.

You configure drop profiles statically (at the `[edit class-of-service drop-profiles]` hierarchy level).

Options

profile-name—Name of the drop profile.

predefined-variable—One of the following Junos predefined variable that is replaced with a value obtained from the RADIUS server when a subscriber authenticates over the interface to which the dynamic profile is attached:

- `$junos-cos-scheduler-dropfile-low`—Name of the drop profile for PLP level `low` and protocol `any`, specified for a scheduler configured in a dynamic profile for subscriber access.
- `$junos-cos-scheduler-dropfile-medium-low`—Name of the drop profile for PLP level `medium-low` and protocol `any`, specified for a scheduler configured in a dynamic profile for subscriber access.
- `$junos-cos-scheduler-dropfile-medium-high`—Name of the drop profile for PLP level `medium-high` and protocol `any`, specified for a scheduler configured in a dynamic profile for subscriber access.
- `$junos-cos-scheduler-dropfile-high`—Name of the drop profile for PLP level `high` and protocol `any`, specified for a scheduler configured in a dynamic profile for subscriber access.

- `$junos-cos-scheduler-dropfile-lny`—Name of the drop profile for PLP level `any` and protocol `any`, specified for a scheduler configured in a dynamic profile for subscriber access.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.3.

The `$junos-cos-scheduler-dropfile-low`, `$junos-cos-scheduler-dropfile-medium-low`, `$junos-cos-scheduler-dropfile-medium-high`, `$junos-cos-scheduler-dropfile-high`, and `$junos-cos-scheduler-dropfile-any` predefined variable introduced in Junos OS Release 9.4.

Description

Use the parameters *(0 | 1 | 2 | all)* for the GTP release version number for a specific message type. The possible versions are 0, 1, 2, or all. You can configure the device to drop packets that do not meet your specified minimum or maximum message lengths. A GTP message type includes one or many messages. When you drop a message type, you automatically drop all messages of the specified type.

From Junos OS Release 20.4R1 onwards, the `[edit security gprs gtp profile profile-name]` hierarchy level is replaced by `[edit security gtp profile profile-name]`.

       x2ap;
```

```
    }
}
```

Hierarchy Level

```
[edit security sctp profile profile-name]
```

Description

Configure the drop SCTP message types to display information about the configuration of the current Stream Control Transmission Protocol (SCTP) inspection.

From Junos OS Release 20.4R1 onwards, the `[edit security gprs sctp profile profile-name]` hierarchy level is replaced by `[edit security sctp profile profile-name]`.

Options

- **m3ua-services**—M3UA data service indicator. The following values are supported:
  - **isup**—ISDN Upper Part.
  - **sccp**—Signaling Connection Control Part.
  - **tup**—Telephone User Part.
- **payload-protocol**—SCTP payload protocol identifier. The following values are supported:
  - **id**—Specify payload protocol ID.
  - **all**—All SCTP payload protocol identifiers (id:0~63).
  - **asap**—Aggregate Server Access Protocol.
  - **bicc**—Bearer Independent Call Control.
  - **ddp-segement**—Direct Data Placement Segment chunk.
  - **ddp-stream**—Direct Data Placement Stream session control.
  - **diameter-dtls**—Diameter in a DTLS/SCTP DATA chunk.
  - **diameter-sctp**—Diameter in a SCTP DATA chunk.
  - **dua**—DPNSS/DASS 2 extensions to IUA Protocol.

- **enrp**—Endpoint Handlespace Redundancy Protocol.
- **h248**—H.248 Protocol.
- **h323**—H.323 Protocol.
- **iua**—ISDN User Adaptation Layer.
- **m2pa**—MTP2 User Peer-to-Peer Adaption Layer.
- **m2ua**—MTP2 User Adaption Layer.
- **m3ua**—MTP3 User Adaption Layer.
- **qipc**—Q.IPC.
- **reserved**—Reserved by SCTP.
- **s1ap**—S1 Application Protocol (S1AP).
- **simco**—Simple Middlebox Configuration.
- **sua**—SCCP User Adaption Layer.
- **tali**—Transport Adapter Layer Interface.
- **v5ua**—v5.2 User Adaption Layer.
- **x2ap**—X2 Application Protocol (X2AP).

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.2. Support for the `payload-protocol` statement was modified n Junos OS Release 12.1X46-D10.

drop-threshold

IN THIS SECTION

- Syntax | 5978
- Hierarchy Level | 5978
- Description | 5978
- Default | 5979
- Options | 5979
- Required Privilege Level | 5979
- Release Information | 5979

Syntax

```
drop-threshold number;
```

Hierarchy Level

```
[edit vlans vlan-name dot1q-tunneling layer2-protocol-tunneling (all | protocol-name vlan-name
dot1q-tunneling layer2-protocol-tunneling (all | protocol-name)]
```

```
[edit protocols layer2-control bpdu-block interface interface-name
```

]

Description

Specify the maximum number of Layer 2 PDUs of the specified protocol that can be received per second on the interfaces in a specified VLAN before the switch begins dropping the Layer 2 PDUs. The drop threshold value must be less than or equal to the shutdown threshold value.

L2PT processing is done by the CPU, and L2PT traffic to the CPU is rate-limited to a maximum of 1000 pps. If traffic is received at a rate faster than this limit, the rate limit causes the traffic to be dropped before it hits the threshold and the dropped packets are not reported in L2PT statistics. This can also

occur if you configure a drop threshold that is less than 1000 pps but traffic is received at a faster rate. For example, if you configure a drop threshold of 900 pps and the VLAN receives traffic at rate of 1100 pps, L2PT statistics will show that 100 packets were dropped. The 100 packets dropped because of the rate limit will not be reported. Similarly, if you do not configure a drop threshold and the VLAN receives traffic at rate of 1100 pps, the 100 packets dropped because of the rate limit are not reported.

> **NOTE**: If the drop threshold value is greater than the shutdown threshold value and you try to commit the configuration, the commit operation fails.

You can specify a drop threshold value without specifying a shutdown threshold value.

Default

No drop threshold is specified.

Options

number—Maximum number of Layer 2 PDUs of the specified protocol that can be received per second on the interfaces in a specified VLAN before the switch begins dropping the Layer 2 PDUs.

- **Range:** 1 through 1000

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.0.

drop-threshold (Security GPRS)

IN THIS SECTION

- Syntax | 5980
- Hierarchy Level | 5980
- Description | 5980
- Options | 5981
- Required Privilege Level | 5981
- Release Information | 5981

Syntax

```
drop-threshold {
    forward number;
    reverse number;
}
```

Hierarchy Level

```
[edit security gtp profile profile-name path-rate-limit message-type (create-req | delete-req |
echo-req | other)]
```

Description

Configure the drop-threshold parameter to drop traffic when the number of packets per second or per minute exceeds the configured limit.

From Junos OS Release 20.4R1 onwards, the `[edit security gprs gtp profile profile-name path-rate-limit message-type (create-req | delete-req | echo-req | other)]` hierarchy-level is replaced by `[edit security gtp profile profile-name path-rate-limit message-type (create-req | delete-req | echo-req | other)]`.

Options

number—Limit messages in forward or reverse direction.

- **Range:** 1 through 10,000.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1X45-D10.

drop-timeout

IN THIS SECTION

- Syntax | 5982
- Hierarchy Level | 5982
- Description | 5982
- Options | 5982
- Required Privilege Level | 5982
- Release Information | 5982

Syntax

```
drop-timeout milliseconds;
```

Hierarchy Level

```
[edit interfaces ls-fpc/pic/port:channel mlfr-uni-nni-bundle-options],
[edit interfaces (ls-fpc/pic/port | ml-fpc/pic/port) unit logical-unit-number],
[edit logical-systems logical-system-name interfaces ls-fpc/pic/port:channel mlfr-uni-nni-bundle-
options],
[edit logical-systems logical-system-name interfaces (ls-fpc/pic/port| ml-fpc/pic/port) unit
logical-unit-number]
```

Description

For multilink and link services interfaces only, configure the drop timeout period, in milliseconds.

Options

milliseconds—Drop timeout period.

- **Range:** 1 through 2000 milliseconds
- **Default:** 500 ms for bundles greater than or equal to the T1 bandwidth value, and 1500 ms for other bundles. Any CLI-configured value overrides these defaults. Setting a value of 0 reverts to the default.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

RELATED DOCUMENTATION

Configuring Link and Multilink Services Logical Interfaces

drop-timeout (Forwarding Class)

IN THIS SECTION

- Syntax | 5983
- Hierarchy Level | 5983
- Description | 5983
- Default | 5983
- Options | 5984
- Required Privilege Level | 5984
- Release Information | 5984

Syntax

```
drop-timeout milliseconds;
```

Hierarchy Level

```
[edit class-of-service fragmentation-map map-name forwarding-class class-name]
```

Description

Disable or set the resequencing timeout interval for each forwarding class of a multiclass MLPPP.

Default

If you do not include this statement, the default sequencing timeouts for T1 speeds (500 ms) or lower (1500 ms) apply.

Options

milliseconds—Time to wait for fragments. A value of 0 disables the resequencing logic for that forwarding class.

- **Range:** 0 through 500 milliseconds for bundles with bandwidths or T1 speeds or higher or 1500 ms for bundles with bandwidths of less than T1 speeds.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.2.

RELATED DOCUMENTATION

Configuring Drop Timeout Interval for Fragmentation by Forwarding Class

drop-unknown-mac-ip

IN THIS SECTION

- Syntax | 5985
- Hierarchy Level | 5985
- Description | 5985
- Required Privilege Level | 5985
- Release Information | 5985

Syntax

```
drop-unknown-mac-ip;
```

Hierarchy Level

```
[edit logical-systems name routing-instances name protocols evpn],
[edit routing-instances name protocols evpn],
```

```
[edit logical-systems name routing-instances name bridge-domains name bridge-options],
[edit routing-instances name bridge-domains name bridge-options],
```

```
[edit routing-instances name vlans name switch-options],
[edit vlans name switch-options]
```

Description

Disable dynamic learning of MAC-IP entries. The ingress PE router drops all ARP requests and NS messages directed to unknown IP addresses.

Required Privilege Level

[none specified]

Release Information

Statement introduced in Junos OS Release 23.4R1.

ds-lite

IN THIS SECTION

- Syntax | 5986
- Hierarchy Level | 5986
- Description | 5986
- Options | 5987
- Required Privilege Level | 5987
- Release Information | 5987

Syntax

```
    ds-lite ds-lite-softwire-concentrator {
        auto-update-mtu;
        flow-limit flow-limit | session-limit-per-prefix session-limit-per-prefix;
        mtu-v6 bytes;
        softwire-address softwire-address;
    }
}
```

Hierarchy Level

```
[edit services softwire softwire-concentrator]
[edit services softwires softwire-types]
```

Description

Configure settings for a DS-Lite concentrator used to process IPv4 packets encapsulated in IPv6.

The `ds-lite` statement is supported on MX Series routers with MS-DPCs and on M Series routers with MS-100, MS-400, and MS-500 line Multiservices PICs. Starting in Junos OS release 17.4R1, DS-Lite is supported on MX Series routers with MS-MPCs and MS-MICs.

Options

bytes—Maximum transmission unit (MTU), in bytes, for encapsulating IPv4 packets into IPv6. If the final length is greater than the configured value, the IPv6 packet is fragmented. This option is supported on MX Series routers equipped with MS-DPCs. Starting in Junos OS release 18.1R1, this option is also supported on MX Series routers with MS-MPCs or MS-MICs.

ds-lite-softwire-concentrator—Name applied to a DS-Lite softwire concentrator.

auto-update-mtu—This option is not currently supported.

copy-dscp—Copy DSCP information to IPv4 headers during decapsulation.

flow-limit—Maximum number of IPv4 flows per softwire.

- **Range:** 0 through 16384 flows
- **Range:** 0 through 9192 bytes

session-limit-per-prefix—Maximum number of sessions per B4 subnet prefix. This option is supported on MX Series routers equipped with MS-DPCs. Starting in Junos OS Release 18.2R1, this option is also supported on MS-MPCs and MS-MICs.

- **Range:** 0 through 16384 sessions

softwire-address—Address of the DS-Lite softwire concentrator.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.4.

auto-update-mtu option introduced in Junos OS Release 10.4.

copy-dscp option introduced in Junos OS Release 11.2.

mtu-v6 option introduced in Junos OS Release 10.4.

softwire-address option introduced in Junos OS Release 10.4.

Support for DS-Lite at the `[edit services softwires softwire-types]` added in Junos OS release 20.2R1 for Next Gen Services on MX240, MX480 and MX960 routers.

dscp-code-point (CoS Host Outbound Traffic)

IN THIS SECTION

- Syntax | 5991
- Hierarchy Level | 5991
- Description | 5992
- Options | 5992
- Required Privilege Level | 5992
- Release Information | 5992

Syntax

```
dscp-code-point value;
```

Hierarchy Level

```
[edit class-of-service host-outbound-traffic]
```

Description

Specify the value of the DSCP bits in the type of service (ToS) field of host outbound traffic (packets generated by the local Routing Engine) as they are placed in the default or specified output queue on all egress interfaces. This statement does not affect transit traffic or incoming traffic.

If you use the `ping` operational mode command with the `tos` *`type-of-servce`* option, the value specified in this configuration statement overrides the DSCP value you specify in the `ping` command.

> **NOTE**: With this configuration, QFX Series switches rewrite DSCP code points for *all* packets that are host-generated. EX Series switches and MX Series routers rewrite DSCP code points *only if* the packet L3 TOS value is not already set or is marked with the default code point.
>
> Any DSCP rewrite rules configured on a 10-Gigabit Ethernet LAN/WAN PIC with SFP+ overwrite this DSCP value.

For egress interfaces hosted on MX Series routers, M120 routers, or Enhanced III FPCs in M320 routers, both Routing Engine sourced traffic and distributed protocol handler traffic are affected. For all other egress interfaces, only Routing Engine sourced traffic is affected.

Options

code-point	Six-bit DSCP code point value.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.4.

Support for distributed protocol handler traffic introduced in Junos OS Release 13.2.

- Required Privilege Level | 6003
- Release Information | 6003

Syntax

```
dscp (rewrite-name | default);
```

Hierarchy Level

```
[edit dynamic-profiles profile-name class-of-service interfaces interface-name unit logical-unit-number rewrite-rules]
```

Description

For IPv4 traffic, apply a Differentiated Services (DiffServ) code point (DSCP) rewrite rule to a subscriber interface in a dynamic profile.

Options

rewrite-name—Name of a `rewrite-rules` mapping configured at the `[edit class-of-service rewrite-rules dscp]` hierarchy level.

`default`—The default mapping.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.1.

rewrite-rules

dscp (flow-server)

IN THIS SECTION

- Syntax | 6004
- Hierarchy Level | 6004
- Description | 6004
- Options | 6004
- Required Privilege Level | 6004
- Release Information | 6004

Syntax

```
dscp dscp-value;
```

Hierarchy Level

```
[edit forwarding-options sampling instance instance-name family (inet | inet6) output flow-
server hostname]
```

Description

Specify the Differentiated Services Code Point (DSCP) mapping that is applied to exported packets for inline active flow monitoring. This allows different levels of service to be assigned to sampled traffic.

Options

dscp *dscp-value*

Can be a value between 0 and 63 (the default is 0). When the same `flow-server` is configured under both the `inet` and `inet6` families in a sampling instance, use the same `dscp` value for both `flow-server` appearances.

The *dscp-value* is overwritten by the CoS DSCP value if you configure `dscp` under the `[edit class-of-service]` hierarchy.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1F4.

Statement introduced in Junos OS Release 16.1 for the MX Series.

dscp (Input Congestion Notification)

IN THIS SECTION

- Syntax | 6005
- Hierarchy Level | 6005
- Description | 6005
- Required Privilege Level | 6006
- Release Information | 6006

Syntax

```
dscp {
    code-point [code-point-bits] {
        pfc {
            mru mru-value;
        }
        xon (Input Congestion Notification)
    }
}
```

Hierarchy Level

```
[edit class-of-service congestion-notification-profile name input]
```

Description

Configure a Differentiated Services code point (DSCP) value and apply priority-based flow control (PFC) to packets with that code point.

When this statement is configured, DSCP-based PFC can be invoked for untagged traffic by matching specified 6-bit DSCP values in the Layer 3 IP header of incoming packets instead of an IEEE 802.1p priority in the Layer 2 VLAN header. Additional configuration parameters associate configured DSCP values with a PFC priority to use in the Layer 2 pause frames sent to peers when the link becomes congested.

DSCP-based PFC can be used to support Remote Direct Memory Access (RDMA) over converged Ethernet version 2 (RoCEv2).

To enable DSCP-based PFC:

- Use this statement to define a congestion notification profile to enable PFC on traffic specified by a DSCP value.
- Use the `[edit class-of-service forwarding-classes class class-name]` `pfc-priority` statement to map a lossless forwarding class to a PFC priority value to use in the PFC pause frames.
- Use the `[edit class-of-service classifiers]` `dscp` statement to set up a DSCP classifier for the desired DSCP value and forwarding class mapped to a PFC priority above.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.4R1.

dscp (Multifield Classifier)

IN THIS SECTION

- Syntax | 6017
- Hierarchy Level | 6018
- Description | 6018
- Options | 6018
- Required Privilege Level | 6018
- Release Information | 6018

Syntax

```
dscp [0 | value];
```

Hierarchy Level

```
[edit firewall family family-name filter filter-name term term-name then]
```

Description

Set the IPv4 Differentiated Services code point (DSCP) bit. You can specify a numerical value from `0` through `63`. To specify the value in hexadecimal form, include `0x` as a prefix. To specify the value in binary form, include `b` as a prefix.

The default DSCP value is `be` (best effort), or `0`.

For M320 and T Series routers, set the DSCP field of incoming or outgoing packets to `000000`. On the same packets, you can use a behavior aggregate (BA) classifier and a rewrite rule to rewrite the MPLS EXP field.

For MX Series routers with MPCs and EX Series switches, the DSCP field can be set from a numeric range.

For MX Series routers and EX Series switches, if you configure a firewall filter with a `dscp` action or `traffic-class` action on a DPC, the commit fails.

If you apply a firewall filter with a `dscp` action on an AE member interface, the commit fails. However, you can apply a firewall filter with a `dscp` action on a full AE interface.

Options

value—For MX Series routers with MPCs, specify the field of incoming or outgoing packets in the range from `0` through `63`.

Required Privilege Level

firewall—To view this statement in the configuration.

firewall-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 7.4.

[edit class-of-service interfaces interface-name rewrite-rules],
[edit class-of-service interfaces interface-name unit logical-unit-number rewrite-rules]
```

Description

For IPv4 traffic, apply a Differentiated Services (DiffServ) code point (DSCP) rewrite rule to an interface. Supported interfaces for rewrite rules depend on the platform and software release.

Logical interfaces do not support multiple `dscp` rewrite rules for the same protocol.

Options

rewrite-name	Name of a `rewrite-rules` mapping configured at the `[edit class-of-service rewrite-rules dscp]` hierarchy level.
default	The default mapping.
protocol inet-both	Rewrite the DSCP CoS value to both the inner and outer header for Unicast/Multicast IPv4 traffic. The first six bits of the CoS value are rewritten and the final two bits are taken from the incoming CoS value.
protocol inet-outer	Rewrite the DSCP CoS value to the outer header for Unicast/Multicast IPv4 traffic. The first six bits of the CoS value are rewritten and the final two bits are taken from the incoming CoS value.
protocol mpls	(Optional for ingress MPLS tunnel nodes) Rewrite the MPLS EXP bits in the MPLS header independently of the IPv4 DSCP value for IPv4 packets entering an MPLS tunnel.

Required Privilege Level

```

Description

Configure adjustments to actual DSL data rates as follows:

- Multiply the actual data rate by a percentage for only downstream rates or for both upstream an downstream rates
- Adjust the encapsulation overhead by adding to or subtracting from the total cell or frame bytes a specified number of bytes

The actual (unadjusted) downstream and upstream data rates, DSL line type, and encapsulation mode are received from the access node by the ANCP agent in ANCP port messages, or by the PPPoE daemon from the PPPoE intermediate agent (PPPoE-IA) in PADI or PADR messages. The ANCP agent or PPPoE daemon subsequently adjusts rates and bytes based on the configuration.

If the DSL-Type TLV (0x91) is not received in either the ANCP Port Status message or PPPoE-IA tags, the default adjustment leaves the rates and bytes unchanged.

Adjustments are applied to all subscribers using access lines of the specific DSL line type. Depending on the value, it may be reported to AAA, CoS, or both:

- Adjusted and unadjusted downstream and upstream rates are always reported to AAA in response to an AAA request.
- Adjusted and unadjusted downstream rates and overhead byte adjustments are reported to CoS, but only when you include the `qos-adjust` statement at the `[edit protocols ancp]` hierarchy level.
- Overhead byte adjustments are not reported to AAA.

AAA reports the adjusted values to the RADIUS server in the Access-Request and Accounting-Request messages through Juniper Networks VSAs 26-141, Downstream-Calculated-Qos-Rate Rate, and 26-142, Upstream-Calculated-Qos-Rate. A change in value triggers an immediate Interim-Accounting message to the RADIUS server if you have configured the "ancp-speed-change-immediate-update" on page 2251 statement.

The ANCP agent reports these values to the LAC in an L2TP network. The LAC passes the rates to the LNS in the following AVPs and messages:

- AVP 24, Tx Connect Speed (ICCN message)—For the initial total rate adjustment to Actual-Data-Rate-Downstream TLV (0x82).
- AVP 38, Rx Connect Speed (ICCN message)—For the initial total rate adjustments to Actual-Data-Rate-Upstream TLV (0x81).
- AVP 97, Connect Speed Update (CSUN message)—For subsequent changes to the initial rates reported in AVP 24 and AVP 38.

Options

adsl Sets attributes for ADSL access lines.

adsl2 Sets attributes for ADSL2 access lines.

adsl2-plus Sets attributes for ADSL2+ access lines.

gfast Sets attributes for G.fast high speed access lines connected to a PON tree infrastructure.

gfast-bonded Sets attributes for G.fast high speed bonded access lines connected to a PON tree infrastructure.

other Sets attributes for access lines of type OTHER. For example, when an OLT sends PON rates in DSL TLVs, the DSL type is set to OTHER.

overhead-adjust ***percentage*** Adjusts the actual downstream rates for all subscribers on the specified access line by multiplying the rate by the specified percentage. This adjustment accounts for the Layer 1 overhead for the DSL type. For the subscriber access line, the adjustment is made to the downstream rate reported in the Actual-Data-Rate-Downstream TLV (0x82). The overhead is adjusted as follows:

- When Agent-Remote-Id TLV (0x02) is different than Access-Aggregation-Circuit-ID-ASCII (0x03), the adjustment shapes the logical interface (residential subscribers) or the interface set (business subscribers), as determined by the CoS adjustment control profile.
- When Agent-Remote-Id TLV (0x02) equals Access-Aggregation-Circuit-ID-ASCII (0x03), the adjustment shapes the PON tree or bonded copper line (parent) interface set, as determined by the CoS adjustment control profile.

- **Range:** 80 through 100 percent
- **Default:** 100 percent

overhead-bytes *bytes*

Adjusts the actual downstream cell overhead for all subscribers on the specified access line by adding or subtracting the specified number of bytes. The adjustment accounts for the traffic encapsulation overhead. The adjustment is made to the overhead reported in the Actual-Data-Rate-Downstream TLV (0x82). The overhead is adjusted as follows:

- Agent-Remote-Id TLV (0x02) is different than Access-Aggregation-Circuit-ID-ASCII (0x03)—The adjustment shapes the logical interface (residential subscribers) or the interface set (business subscribers), as determined by the CoS adjustment control profile.
- Agent-Remote-Id TLV (0x02) equals Access-Aggregation-Circuit-ID-ASCII (0x03)—The adjustment shapes the (parent) interface set for a PON tree (FTTB) or bonded copper line (CuTTB) as determined by the CoS adjustment control profile.
- **Range:** -100 through 100 bytes
- **Default:** 0 bytes

sdsl

Sets attributes for SDSL access lines.

sdsl-bonded

Sets attributes for bonded SDSL access lines.

total-adjust *percentage*

Adjusts the downstream and upstream data rates for all subscribers on an access line of the specified types by multiplying the rate by the specified percentage. This adjustment accounts for the total Layer 1 and encapsulation overhead for the DSL type. The adjustment is made to the Actual-Data-Rate-Downstream TLV (0x82) and Actual-Data-Rate-Upstream TLV (0x81).

- **Range:** 1 through 100 percent
- **Default:** 100 percent

type *tlv-value*

Sets attributes for access lines by specifying the unsigned integer value of the DSL-Type TLV (0x91) to reference the DSL type. This option enables the `dsl` statement to be used for DSL access line types that might be introduced in the future.

- **Range:** 14 through 4294967295

vdsl

Sets attributes for VDSL access lines.

vdsl2

Sets attributes for VDSL2 access lines.

vdsl2-annex-q	Sets attributes for VDSL2 Annex Q access lines.
vdsl2-annex-q-bonded	Sets attributes for bonded VDSL2 Annex Q access lines.
vdsl2-bonded	Sets attributes for bonded VDSL access lines.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 19.3R1.

    }
    vdsl-options {
        carrier carrier setting;
        profile profile;
    }
}
```

Hierarchy Level

```
[edit interfaces interface name]
```

Description

Configure ADSL properties on SRX Series Firewalls.

Follow these example pre-configuration steps with the SFP inserted on slot 8 of the device, required for Annex J support. You must configure one logical interface for *x*DSL SFP control path to work.

1. ADSL and Annex J on `inet` interface:

```
user@host# set interfaces ge-0/0/8 unit 0 family inet address 10.1.1.10/24
user@host# set interfaces ge-0/0/8 dsl-sfp-options adsl-options vpi 8 vci 36 encap llcsnap-
bridged-802.1q
user@host# set interfaces ge-0/0/8 dsl-sfp-options adsl-options vpi 8 vci 36 annex auto encap
llcsnap-bridged-802.1q
```

2. ADSL and Annex J without vlan on Ethernet-switching interface:

```
user@host# set interfaces ge-0/0/8 unit 0 family ethernet-switching vlan members xdsl-test
user@host# set interfaces irb unit 50 family inet address 10.1.1.10/24
user@host# set vlans xdsl-test vlan-id 50
user@host# set vlans xdsl-test l3-interface irb.50
user@host# set interfaces ge-0/0/8 dsl-sfp-options adsl-options vpi 8 vci 36 encap llcsnap-
bridged-802.1q
user@host# set interfaces ge-0/0/8 dsl-sfp-options adsl-options vpi 8 vci 36 annex auto encap
llcsnap-bridged-802.1q
```

3. ADSL and Annex J with vlan on Ethernet-switching interface:

```
user@host# set interfaces ge-0/0/8 native-vlan-id 50
user@host# set interfaces ge-0/0/8 unit 0 family ethernet-switching interface-mode trunk
user@host# set interfaces ge-0/0/8 unit 0 family ethernet-switching vlan members xdsl-test
user@host# set interfaces irb unit 50 family inet address 10.1.1.10/24
user@host# set vlans xdsl-test vlan-id 50
user@host# set vlans xdsl-test l3-interface irb.50
user@host# set interfaces ge-0/0/8 dsl-sfp-options adsl-options vpi 8 vci 36 encap llcsnap-
bridged-802.1q
user@host# set interfaces ge-0/0/8 dsl-sfp-options adsl-options vpi 8 vci 36 annex auto encap
llcsnap-bridged-802.1q
```

Similarly, to set up G.fast option under `dsl-sfp-options`, use:

```
user@host# set interfaces ge-0/0/8 unit 0 family inet address 10.1.1.1/24
user@host# set interfaces ge-0/0/8 dsl-sfp-options gfast-options carrier a43
```

Options

adsl-options Options of ADSL interface.

annex (auto | annexj-off) The Annex type.

carrier Carrier setting on VDSL. Supported VDSL carriers are A43, B43, and auto. Supported G.fast carriers are A43, A43c, B43, and B43c.

encap The encapsulation type.

gfast-options	Options of G.fast (Gigabit broadband access technology).
profile	The profile type on VDSL.
vci	Virtual circuit identifier.
vdsl-options	Options.
vpi	Virtual path identifier.

dslite-softwire-initiator

IN THIS SECTION

- Syntax | 6034
- Hierarchy Level | 6034
- Description | 6034
- Options | 6034
- Required Privilege Level | 6035

Release Information | 6035

Syntax

```
dslite-softwire-initiator {
    maximum amount;
     reserved amount;
}
```

Hierarchy Level

```
[edit system security-profile]
```

Description

Specifies the number of IPv6 dual-stack lite (DS-Lite) softwire initiators that connects to the softwire concentrator configured in either a user logical system or the primary logical system. The option is configured in the security profile that is bound to the logical system.

Only the primary administrator can create security profiles and bind them to logical systems. The primary administrator:

- Uses security profiles to provision logical systems with resources
- Binds security profiles to user logical systems and the primary logical system
- Configures more than one security profile, specifying different amounts of resource allocations in various profiles

Options

- `maximum` *amount*—A maximum allowed quota. If a logical system requires more of a resource than its reserved amount allows, it can utilize resources configured for the global maximum amount if they are available—that is, if they are not allocated to other logical systems. The maximum allowed quota specifies the portion of the free global resources that the logical system can use. The maximum allowed quota does not guarantee that the amount specified for the resource in the security profile is available. Logical systems compete for global resources. The default is the system maximum.

- `reserved` *amount*—A reserved quota that guarantees that the resource amount specified is always available to the logical system. The default is 0.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1.

[edit interfaces interface-name serial-options dte-options]
```

Description

For EIA-530 and V.35 interfaces only, configure the to-DCE signal, data-transmit-ready (DTR).

Options

signal-handling-option—Signal handling for the DTR signal. The signal handling can be one of the following:

`assert`—The to-DCE signal must be asserted.

`auto-synchronize`—Normal DTR signal with automatic synchronization. This statement has two substatements:

`duration` *milliseconds*—Pulse duration of resynchronization.

- **Range:** 1 through 1000 milliseconds
- **Default:** 1000 milliseconds

`interval` *seconds*—Offset interval for resynchronization.

- **Range:** 1 through 31 seconds
- **Default:** 15 seconds

`de-assert`—The to-DCE signal must be deasserted.

`normal`—Normal DTR signal handling as defined by the TIA/EIA Standard 530.

- **Default:** `normal`

Required Privilege Level

[edit tenants name routing-instances name protocols pim interface]
```

Description

Enable PIM dual designated router mode for a pair of Multichassis Link Aggregation Group (MC-LAG) peers managing VLAN multicast traffic and Layer 3 multicast traffic over IRB interfaces.

PIM dual designated router mode sets up one device in a pair of MC-LAG peers as a primary designated router (DR) and the other device as a standby or backup DR for redundancy in managing multicast packet forwarding. Both devices join the multicast forwarding tree and receive multicast traffic. If the primary device fails, the standby quickly takes over forwarding multicast packets with minimal traffic disruption.

In the default or backwards-compatible dual designated router mode (no `enhanced` option specified), both DRs forward packets for a short time while negotiating which device will forward the multicast traffic. After PIM forwarder negotiation, only one device continues to forward traffic. If the primary DR fails, the standby can take over forwarding multicast packets upon detecting the failure. When the primary DR comes back online and is receiving multicast traffic again, it resumes forwarding and invokes PIM forwarder negotiation again to reduce duplicate packet load.

In enhanced dual designated router mode (`enhanced` option specified), both the primary and standby DRs receive multicast traffic, but only the primary DR forwards the packets, skipping PIM forwarder negotiation. Upon primary DR failure, the standby takes over forwarding immediately, and also switches to primary role. When the prior primary DR comes back online, it assumes the standby role, receiving but not forwarding multicast traffic. The new primary DR continues forwarding multicast packets without any traffic interruption, and again no duplicate packet traffic is generated.

If you want to enable dual designated router mode, we recommend using the `enhanced` option, if available, to achieve optimal convergence time in resuming multicast traffic flow both when a DR fails and when it comes back online again.

Options

none Enable default dual designated router mode (available for backwards compatibility).

enhanced Enable enhanced PIM dual designated router mode (recommended if available).

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2X51 for the QFX Series.

Statement introduced in Junos OS Release 16.1 for the MX Series.

Statement with enhanced option introduced in Junos OS Release 17.2R1 for Junos Fusion Data Center.

dual-phase-bootup

IN THIS SECTION

- Syntax | 6047
- Hierarchy Level | 6048
- Description | 6048
- Default | 6048
- Required Privilege Level | 6048
- Release Information | 6049

Syntax

```
dual-phase-bootup;
```

Hierarchy Level

```
[edit system]
```

Description

You can prevent the device from reaching an amnesiac state post-reboot by configuring the dual-phase-bootup feature before the reboot. When a device has a scaled configuration or has a lot of constraints to be validated, upon reboot it may take more than 45 minutes to finish. This lengthy reboot time exceeds the limit set for the watchdog timer. The watchdog timer going off can cause the device to reach an amnesiac state. To avoid reaching an amnesiac state during a future reboot, configure the `dual-phase-bootup` statement.

If you have configured the `dual-phase-bootup` statement before the reboot, the device picks up the rescue configuration from the next reboot. Post-reboot, the device's operational state is active and the device automatically loads the last-configured user configuration (**juniper.conf** file), thus preventing the device from reaching an amnesiac state.

To be able to commit the configuration for the `dual-phase-bootup` statement, you must already have created a rescue configuration (**rescue.conf** file). We recommend that you have a minimal rescue configuration.

During device upgrades or downgrades, this feature enables a two-step restart process. If the `dual-phase-bootup` statement is already configured and committed, the device picks up the **rescue.conf** file during any upgrade or downgrade. The image is then validated against both the **rescue.conf** file and the **juniper.conf** file. An internal commit is performed post-reboot, with the latest last-run user configuration being committed. While this configuration is being committed, you cannot make any changes to the configuration.

To check the status of an ongoing dual-phase bootup or to check if it is enabled, use the `show dual-phase-bootup-status` operational mode command.

Default

Dual-phase bootup is turned off by default.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

```

Description

Specifies common configuration settings that are used for both legs (DHCP and DHCPv6) of the DHCP dual stack, and names the dual stack group.

The group is assigned to each leg of the DHCP dual-stack with the "dual-stack" on page 6050 statement in the `overrides` stanza. When applied, the dual-stack configuration takes precedence over all other configurations, such as those specified in global, group, or interface settings.

Options

name	Name of the dual-stack group.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement in the configuration.

Release Information

Statement introduced in Junos OS Release 15.1.

- Required Privilege Level | 6060

Release Information | 6060

Syntax

```
dual-transport {
    inet-lsr-id inet-lsr-id;
    inet6-lsr-id inet6-lsr-id;
}
```

Hierarchy Level

```
[edit protocols ldp]
```

Description

Configure to allow Junos LDP to establish the TCP connection over IPv4 with IPv4 neighbors, and over IPv6 with IPv6 neighbors as a single-stack LSR. `inet-lsr-id` and `inet6-lsr-id` are the two LSR IDs that have to be configured to establish an LDP session over IPv4 and IPv6 TCP transport. These two IDs should be non-zero and must be configured with different values.

Options

inet-lsr-id *inet-lsr-id* Configure the LSR ID to establish an LDP session over IPv4 TCP transport.

inet6-lsr-id *inet6-lsr-id* Configure the LSR ID to establish an LDP session over IPv6 TCP transport.

dualstack-support (JSRC)

IN THIS SECTION

- Syntax | 6061
- Hierarchy Level | 6061
- Description | 6061
- Default | 6062
- Required Privilege Level | 6062
- Release Information | 6062

Syntax

```
dualstack-support;
```

Hierarchy Level

```
[edit jsrc]
```

Description

Configure JSRC provisioning for dual-stack subscribers so that it reports information about the separate stacks for a given subscriber, using a single JSRC session. By default (and in all cases for releases earlier than Junos OS Release 18.1R1), the DHCPv4 and DHCPv6 stacks are treated as a single subscriber; the

remote SRC peer (SAE) is not informed about whether only one family or both families are active. The statistics are reported as an aggregate of both families rather than separated by family.

When you configure dual-stack support for JSRC, Diameter AA-Request (AAR) provisioning messages sent to the SAE include Diameter AVPs (IANA enterprise number 2636) to convey the IPv4 and IPv6 addressing information that is available in the session database. For IPv4, that includes Framed-IP-Address (AVP 8) and Framed-IP-Netmask (AVP 9). For IPv6, that includes Framed-IPv6-Address (AVP 168), Framed-IPv6-Prefix (AVP 97), Delegated-IPv6-Prefix (AVP 123), Juniper-IPv6-Ndra-Prefix (AVP 2200), and Juniper-Framed-IPv6-Netmask (AVP 2201). JSRC also includes information about the access line if it is available in the session database, by means of Juniper-Agent-Circuit-Id (AVP 2202) and Juniper-Remote-Circuit-Id (AVP 2203).

When the first network family is activated, JSRC sends the addresses for only that family in the initial request to the provisioning server. When the second network family is activated, the AAR message includes the Juniper-Request-Type AVP (2050) with a value of 4 to signify family activation. When the next-to-last family is deactivated, the same AVP is sent with a value of 5 to signify the deactivation.

Default

Disabled.

[edit logical-systems logical-system-name routing-instances routing-instance-name...],
[edit routing-instances routing-instance-name ...],
[edit system services dhcp-local-server dhcpv6]
```

Description

Specify the criteria that the `jdhcpd` process uses to support duplicate clients. The router uses the additional criteria to distinguish between the duplicate clients.

Duplicate clients have the same DUID (DHCP unique identifier). Typically, the router treats a request from a duplicate client as a renegotiation, and replaces the existing client entry with a new entry. However, in some cases, the duplicate request is from a different client, and replacement is not desired. When you enable duplicate client support, the router uses the additional criteria to distinguish between the two clients, and grants a lease to the new client while retaining the original client entry.

NOTE: The only supported differentiating criterion is `incoming-interface`.

BEST PRACTICE: To allow duplicate clients over the incoming interface for DHCPv6 relay, you must configure the `relay-agent-interface-id` statement to cause the DHCP relay agent to insert the DHCPv6 Interface-ID option (option 18) in DHCPv6 packets destined for the DHCPv6 server.

Do not configure the `use-interface-description` statement, because option 18 must include the interface name rather than an interface description.

CAUTION: We recommend that you do not enable or disable duplicate client support mode when clients are bound, because different client keys are used to store the clients in the database depending on the mode. Changing the mode removes clients from the database and then adds them back with a different key.

Additionally, disabling duplicate client support mode causes all duplicate clients to be deleted.

Options

incoming-interface Allow duplicate clients when the incoming DHCPv6 requests are received over different underlying interfaces.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.1.

duplicate-mac-detection

IN THIS SECTION

- Syntax | 6068
- Hierarchy Level | 6069
- Description | 6069
- Options | 6069
- Required Privilege Level | 6070
- Release Information | 6070

Syntax

```
duplicate-mac-detection {
    action(block | shutdown);
    auto-recovery-time minutes;
    detection-threshold detection-threshold;
```

```
    detection-window seconds;
    include-local-moves;
}
```

Hierarchy Level

```
[edit logical-systems  logical-systems-name protocols evpn],
[edit logical-systems logical-systems-name routing-instances  routing-instance-name protocols evpn],
[edit protocols evpn]
[edit routing-instances  routing-instance-name protocols evpn],
```

Description

Configure duplicate MAC address detection settings. You can configure a threshold for MAC address mobility events and the window for detecting the number of MAC address mobility events. In addition, you can configure the optional recovery time that the Juniper Networks device waits before the duplicate MAC address is unsuppressed.

Prevent loops at the forwarding plane. You can block a duplicate MAC address or shut down the duplicate MAC address's local interfaces. After you block a duplicate MAC address, you can clear it. After you shut down the interface, you can recover it.

Options

action Block the duplicate MAC address. You can also shut down the duplicate MAC address's corresponding local interface.

- block—When the device detects a duplicate MAC address, the device blocks the duplicate MAC address. If you have enabled the `auto-recovery-time` statement, the auto-recovery timer starts. While the timer's running, any duplicate MAC addresses are blocked. When the auto-recovery timer stops, the system clears the duplicate MAC addresses. Alternatively, you can issue the `clear evpn duplicate-mac-suppression <instance name | l2-domain-id | mac-address>` command to manually clear the duplicate MAC addresses.

- shutdown—When the device detects a duplicate MAC address, the device shuts down the local interface. If you enable the `recovery-timeout`statement--for example, `set interfaces et-0/0/0 unit 0 family ethernet-switching recovery-timeout 10`--the auto-recovery timer starts. When the auto-recovery timer stops, the interface is recovered. Alternatively, you can issue the `clear ethernet-switching recovery-timeout` command to manually recover the interface that was shut down.

auto-recovery-time

The length of time a device suppresses a duplicate MAC address. At the end of this interval, MAC address updates will resume. When an auto recovery time is not specified, duplicate MAC address updates will continue to be suppressed. To manually clear the suppression of duplicate MAC address, use the `clear evpn duplicate-mac-suppression` command.

- **Range:** `1-360` minutes

detection-threshold

Both this statement and the `detection-window` statement help detect if the MAC address is a duplicate address. A certain number of MAC mobility events need to be detected before a MAC address before it is identified as a duplicate MAC address. Once the threshold is reached, updates for this MAC address are suppressed.

- **Default:** 5
- **Range:** `2-20`

detection-window

Both this statement and the `detection-threshold` statement help detect if the MAC address is a duplicate address based on the time interval used in detecting a duplicate MAC address. When the number of MAC mobility events for a MAC address exceeds the `detection-threshold` within the detection window, the MAC address is identified as a duplicate MAC address.

- **Default:** 180 seconds
- **Range:** `5-600` seconds

include-local-moves Track local MAC address mobility movements.

> **NOTE**: To ensure that the mobility advertisements have sufficient time to age out, set an auto-recovery-time greater than the detection window.

[edit security ipsec security-association name]
```

Description

Define a dynamic IPsec SA.

Options

`ipsec-policy` *`ipsec-policy-name`*—Name of the IPsec policy.

`replay-window-size`—(Optional) Antireplay window size. It can be one of the following values:

- `32`—32-packet window size.
- `64`—64-packet window size.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

```

Hierarchy Level

```
[edit security]
[edit logical-systems logical-system-name security]
[edit tenants tenant-name security ]
```

Description

Configure security dynamic address for IPv4 and IPv6 networks within a logical system and tenant system. Each dynamic address belongs to only one instance. Within that instance is a set of categories to which the dynamic address further belongs. A dynamic address entry provides dynamic IP address information to the security policies.

Options

address-name Security dynamic address name.

feed-server Security dynamic address feed-server.

traceoptions Security dynamic address tracing options.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 18.4R1.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1X46-D25 on SRX Series Firewalls and on cSRX Container Firewall in Junos OS Release 22.2R1.

dynamic-application

IN THIS SECTION

- Syntax | 6090
- Hierarchy Level | 6090
- Description | 6090
- Options | 6091
- Required Privilege Level | 6091
- Release Information | 6091

Syntax

```
dynamic-application [system-application];
```

Hierarchy Level

```
[edit security application-firewall rule-sets rule-set-name rule rule-name match]
```

Description

Specify the dynamic application names for match criteria in application firewall rule set.

An application firewall configuration permits, rejects, or denies traffic based on the application of the traffic. The AppFW consists of one or more rule sets with rules that specify match criteria, including dynamic applications, and the action to be taken for matching traffic.

The junos:UNKNOWN keyword is reserved for unknown dynamic applications. In the following cases, the application ID is set to junos:UNKNOWN:

- The traffic does not match an application signature in the database.
- The system encounters an error when identifying the application.
- The session fails over to another device.

Traffic with an application ID of junos:UNKNOWN matches a rule with a dynamic application of junos:UNKNOWN. If there is no rule defined for junos:UNKNOWN, the default rule is applied.

Starting in Junos OS Release 18.2R1 application firewall (AppFW) functionality is deprecated. As a part of this change, the `[edit security application-firewall]` hierarchy and all the configuration options under this hierarchy are deprecated— rather than immediately removed—to provide backward compatibility and a chance to bring your configuration into compliance with the new configuration.

Options

`system-application`—Set of system applications for match criteria.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.1.

dynamic-application-group

IN THIS SECTION

- Syntax | 6092
- Hierarchy Level | 6092
- Description | 6092
- Options | 6093
- Required Privilege Level | 6093
- Release Information | 6093

Syntax

```
dynamic-application-group [system-application-group];
```

Hierarchy Level

```
[edit security application-firewall rule-sets rule-set-name rule rule-name match]
```

Description

Specify the dynamic application group to match. When you define application firewall rules, you can specify dynamic application groups as match criteria.

With application identification, multiple applications can be configured in a dynamic application groups for consistent reuse. AppFW rules permit and deny traffic by specifying application names, dynamic application group names, or both. By using predefined application groups, AppFW rules require no updating when new applications are added to common groups.

Starting in Junos OS Release 18.2R1 application firewall (AppFW) functionality is deprecated. As a part of this change, the `[edit security application-firewall]` hierarchy and all the configuration options under this hierarchy are deprecated— rather than immediately removed—to provide backward compatibility and a chance to bring your configuration into compliance with the new configuration.

Options

system-application-group—Set of groups defining one or more system applications for match criteria.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.4.

RELATED DOCUMENTATION

Unified Security Policies

Unified Security Policies

dynamic-application (Security Policies)

IN THIS SECTION

- Syntax | 6095
- Hierarchy Level | 6095
- Description | 6096
- Options | 6096
- Required Privilege Level | 6097
- Release Information | 6097

Syntax

```
dynamic-application dynamic-application-name | dynamic-application-group-name | any | none;
```

Hierarchy Level

```
[edit security policies from-zone zone-name to-zone zone-name policy policy-name match]
[edit security policies global policy policy-name match]
```

Description

Specify the dynamic applications or dynamic application groups used as match criteria within a security policy.

By adding dynamic applications to the match criteria, the data traffic is classified based on the Layer 7 application inspection results. Application Identification (AppID) identifies dynamic or real-time Layer 4 through Layer 7 applications. After a particular application is identified and the matching policy is found, then the actions are applied according to the policy.

Options

dynamic-application-name | dynamic-application-group-name

Specify dynamic applications or dynamic application groups.

Examples for dynamic applications or dynamic application groups are as follows:

- `junos:FTP` (dynamic application).
- Enter `junos:UNKNOWN` when no dynamic application can be determined.
- `junos:web:shopping` (dynamic application group).
- Enter `junos:unassigned` when no dynamic application group can be determined.
- `junos:all-new-apps` (dynamic application group).

  This has newly added application signatures from the latest signature package released in Junos OS Release 21.1R1.

> **NOTE**: When you download the application signature package on your security device, the entire predefined applications and application groups are downloaded. For downloading and installing application signature package, see Predefined Application Signatures for Application Identification

any

Configuring the dynamic application as `any` installs the policy with the application as a wildcard (default). If an application cannot be specified, configure `any` as the default application. Data traffic that match the parameters in a unified policy matches the policy regardless of the application type.

none

Configuring the dynamic application as `none` ignores classification results from AppID and does not use the dynamic application in security policy lookups. Within the list of potential match policies, if there is any policy configured with dynamic application as

none, irrespective of the policy match sequence, this policy is matched as the final policy and is terminal. If any Layer 7 services are configured in this policy, deep packet inspection for the traffic is performed.

When upgrading the Junos OS release from previous releases (where dynamic applications were not supported), all existing traditional policies are considered as policies with the dynamic application configured as none.

> **TIP**: Ensure to match an application if dynamic-application is set to none in the match criteria

If dynamic application is not configured within a security policy, the policy is considered to be a traditional security policy. This policy is similar to a policy with the dynamic application configured as none.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 18.2R1.

        }
    }
}
```

Hierarchy Level

```
[edit security idp]
[edit tenants tenant-name security idp]
```

Description

Configure a dynamic attack group. A dynamic attack group selects its members based on the filters specified in the group. Therefore, the list of attacks is updated (added or removed) when a new signature database is used.

Options

dynamic-attack-group-name—Name of the dynamic attack group.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.3.

The `expression` option added in Junos OS Release 11.4.

Additional tags under filters of dynamic attack groups (CVSS score, age-of-attack, file-type, vulnerability-type) are added in Junos OS Release 18.2R1 for dynamic attacks grouping of IDP signatures. The Product and Vendor tags are already supported under existing filter products. The CLI interface for configuring these tags is now more user friendly with possible completions being available for configuration in 18.2R1.

The `Excluded` and `no-excluded` filters are added in Junos OS Release 19.1R1.

dynamic-class-of-service-options (Dynamic Traffic Shaping)

IN THIS SECTION

Syntax | 6103

- Hierarchy Level | 6103
- Description | 6103
- Options | 6103
- Required Privilege Level | 6104
- Release Information | 6104

Syntax

```
dynamic-class-of-service-options {
    vendor-specific-tags tag;
}
```

Hierarchy Level

```
[edit dynamic-profiles profile-name class-of-service]
```

Description

Configure CoS attributes applied to dynamic interfaces or interface sets based on access line information received in PPPoE discovery packets on dynamic subscriber interfaces. The packets convey the information in PPPoE-IA tags.

Options

`vendor-specific-tags` *tag*—Specify one or more of the following PPPoE-IA tags to set CoS attributes:

- `access-loop-encapsulation`—Set the overhead-accounting CoS attribute based on the Access-Loop-Encapsulation tag (0x91). The tag enables the router to determine whether the access loop is cell-based or frame-based.
- `actual-data-rate-downstream`—Set the shaping-rate class-of-service attribute based on the Actual-Data-Rate-Downstream tag (0x82).
- `apply-to-interface-set`—Enable CoS to determine the node to which it conditionally applies the adjusted downstream rate. By default, when a CoS traffic control profile is configured for both a logical interface and the underlying (child) interface set, the adjusted rate values (shaping rate,

overhead bytes, and overhead mode) are applied to the logical interface, according to the adjustment control profile. When you specify this option, the following conditions are evaluated:

- If the $junos-interface-set-name has been resolved by AAA authorization, CoS applies the adjusted values to the underlying interface set to which the logical interface belongs. The name for this predefined variable is supplied by the Juniper Networks Qos-Set-Name VSA, 26–130. The application of the adjusted values is governed by the adjustment control profile, regardless of whether a traffic control profile is present for the logical interface.
- If the $junos-interface-set-name has not been resolved by AAA authorization, CoS applies the adjusted values to the logical interface, governed by the adjustment control profile. If a traffic control profile is not present for the logical interface, then the adjusted values are applied to the underlying interface set.

This option is appropriate for both five-level and four-level CoS hierarchies.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1.

`apply-to-interface-set` option added in Junos OS Release 19.3R1.

```

Description

Configure the dynamic policy control for the PCC rules, PCC rulebases, or both in a PCEF profile. You can configure a maximum of 32 PCC rules in a PCEF profile. There is no limit to the number of PCC rulebases you can configure in a PCEF profile.

> **NOTE**: If you configure the `dynamic-policy-control` statement for a PCEF profile, you cannot configure the `static-policy-control` statement in the same profile.

The remaining statements are explained separately.

Required Privilege Level

unified-edge—To view this statement in the configuration.

unified-edge-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.1.

IP Address Assignment Pool

dynamic-profile (Demux)

IN THIS SECTION

- Syntax | 6116
- Hierarchy Level | 6116
- Description | 6116

- Options | 6116
- Required Privilege Level | 6117
- Release Information | 6117

Syntax

```
dynamic-profile profile-name {
    network ip-address {
        range name {
            low lower-limit;
            high upper-limit;
        }
    }
}
```

Hierarchy Level

```
[edit interfaces interface-name unit unit-number demux inet auto-configure address-ranges]
[edit interfaces interface-name unit unit-number demux inet6 auto-configure address-ranges]
```

Description

Assign a dynamic profile and specify address options for the demultiplexing (demux) interface options.

Options

profile-name	Name of the dynamic profile for the demultiplexing (demux) interface options.
network *ip-address*	Configure an IPv4 or IPv6 address for a dynamic profile for the demultiplexing (demux) interface options.
range <range-name>	Configure an IP name range used within an address-assignment pool for the demultiplexing (demux) interface options.

- `low` *lower-limit*—Lower limit of IPv4 or IPv6 address range.
- `high` *upper-limit*—Upper limit of IPv4 or IPv6 address range.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 18.1R1.

interface-unit”  auto-configure line-identity],
[edit interfaces interface-name unit logical-unit-number auto-configure line-identity]
```

Description

Attach a dynamic profile to a static or dynamic underlying VLAN interface to create a dynamic VLAN on the interface, based on receiving a trusted option in the DHCP or PPPoE discovery packet. The trusted

option can be the ACI, ARI, both ACI and ARI, or neither. The VLAN is known as an access-line-identifier VLAN.

Options

profile-name	Name of the dynamic profile.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

dynamic-profile (Dynamic PPPoE)

IN THIS SECTION

- Syntax | 6124
- Hierarchy Level | 6124
- Description | 6124
- Options | 6125
- Required Privilege Level | 6125
- Release Information | 6125

Syntax

```
dynamic-profile profile-name;
```

Hierarchy Level

```
[edit dynamic-profiles profile-name interfaces demux0 unit logical-unit-number family pppoe],
[edit dynamic-profiles profile-name interfaces interface-name unit logical-unit-number family
pppoe],
[edit interfaces interface-name unit logical-unit-number family pppoe],
[edit interfaces interface-name unit logical-unit-number pppoe-underlying-options],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number
family pppoe],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number
pppoe-underlying-options]
```

Description

Attach a PPPoE dynamic profile to an underlying Ethernet interface. This underlying interface is configured with either the `encapsulation ppp-over-ether` statement or the `family pppoe` statement; the two statements are mutually exclusive. When the router creates a dynamic PPPoE logical interface on the underlying interface, it uses the information in the dynamic profile to determine the properties of the dynamic PPPoE logical interface.

NOTE: The `[edit ... family pppoe]` hierarchies are supported only on MX Series routers with MPCs.

Starting in Junos OS Release 17.2R1, you can configure converged services for MS-MPCs and MS-MICs. You can configure captive portal content delivery (CPCD) profiles for MS-MICs and MS-MPCs by including the service interface ms-fpc/pic/port statement at the `edit service-set` *`service set name`* `captive-portal-content-delivery-profile` *`profile name`* `interface-service` heirarchy level.

Options

`profile-name`—Name of a previously configured PPPoE dynamic profile, up to 64 characters in length, defined at the `[edit dynamic-profiles` *`profile-name`* `interfaces pp0]` hierarchy level.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.1.

Support for the `[edit ... family pppoe]` hierarchies introduced in Junos OS Release 11.2.

dynamic-profile (PPPoE Service Name Tables)

IN THIS SECTION

Syntax | 6130

- Hierarchy Level | 6130
- Description | 6130
- Options | 6130
- Required Privilege Level | 6131
- Release Information | 6131

Syntax

```
dynamic-profile profile-name;
```

Hierarchy Level

```
[edit protocols pppoe service-name-tables table-name service service-name],
[edit protocols pppoe service-name-tables table-name service service-name agent-specifier aci
circuit-id-string ari remote-id-string]
```

Description

Specify a dynamic profile to instantiate a dynamic PPPoE interface. You can associate a dynamic profile with a named service entry, `empty` service entry, or `any` service entry configured in a PPPoE service name table, or with an agent circuit identifier/agent remote identifier (ACI/ARI) pair defined for these services.

The dynamic profile associated with a service entry in a PPPoE service name table overrides the dynamic profile associated with the PPPoE underlying interface on which the dynamic PPPoE interface is created.

If you include the `dynamic-profile` statement at the `[edit protocols pppoe service-name-tables table-name service service-name agent-specifier aci circuit-id-string ari remote-id-string]` hierarchy level, you cannot also include the `static-interface` statement at this level. The `dynamic-profile` and `static-interface` statements are mutually exclusive for ACI/ARI pair configurations.

Options

profile-name—Name of the dynamic profile that the router uses to instantiate a dynamic PPPoE interface.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.2.

}
```

Hierarchy Level

```
[edit]
```

Description

Create dynamic profiles for use with DHCP or PPP client access.

Options

profile-name Name of the dynamic profile; string of up to 80 alphanumeric characters.

reassemble-packets (Optional) Enables IPv4 reassembly of fragmented GRE packets conveyed across a soft GRE tunnel from a Wi-Fi access point to a Wi-Fi access gateway on a BNG. Reassembly is supported for fragments that range in size from 256 bytes through 8192 bytes.

> **NOTE**:
>
> - The maximum reassembled packet size is 13,310 bytes; this requires an MTU of 1500 bytes. The router drops reassembled packets that

are larger than 13,310 bytes. The router also drops DHCP discover packets that are smaller than the MTU.

- Ordering is not maintained between fragmented packets and non-fragmented packets.
- The WAG does not support soft GRE packets with keys. Fragmented packets GRE with key are not reassembled.
- Soft GRE packet reassembly is not supported for pseudowires over redundant logical tunnels (RLT).
- The order of the last arriving fragment is not guaranteed when the reassembled packets are forwarded.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.2.

Support at the `filter`, `policer`, `hierarchical-policer`, `three-color-policer`, and `policy options` hierarchy levels introduced in Junos OS Release 11.4.

- Release Information | 6149

Syntax

```
dynamic-requests {
    routing-instance routing-instance-name;
    source-address source-address;
    source-port source-port;
}
```

Hierarchy Level

```
[edit access radsec  destination ]
```

Description

Configure RADSEC clients to receive and process dynamic requests. RADSEC servers can be a source of dynamic RADIUS requests such as Change of Authorization (CoA) and RADIUS-initiated disconnect (RID) messages.

You must configure the IP address of the RADSEC server as the source address for the requests. You can also specify the source port that the client monitors for dynamic requests. If the port is not explicitly configured, the default RADSEC port 2083 is used.

Options

routing-instance *routing-instance-name*	Specify the routing instance name.
source-address *ip-address*	(Required) Configure the source IP address, which is the IP address of the RADSEC server. If the source address is not configured, dynamic requests will be rejected.
source-port *port-number*	(Optional) Specify the source port that the client monitors for dynamic requests. If the port is not explicitly configured, the default is used. • **Default:** 2083 • **Range:** 1 through 65535

Required Privilege Level

access—To view this statement in the configuration.

access-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 19.2R1.

Syntax

```
dynamic {
    connections-limit number;
    distinguished-name {
        container container-string;
        wildcard wildcard-string
    }
    general-ikeid;
    hostname domain-name;
    ike-user-type (group-ike-id | shared-ike-id);
    inet ip-address;
    inet6 ipv6-address;
    reject-duplicate-connection;
    user-at-hostname e-mail-address;
}
```

Hierarchy Level

```
[edit security ike gateway gateway-name]
```

Description

Specify the identifier for the remote gateway with a dynamic IPv4 or IPv6 address. Use this statement to set up a VPN with a gateway that has an unspecified IPv4 or IPv6 address.

Options

connections-limit Configure the number of concurrent connections that the group profile supports. When the maximum number of connections is reached, no more dynamic virtual private network (VPN) endpoints dialup users attempting to access an IPsec VPN are allowed to begin Internet Key Exchange (IKE) negotiations. This configuration applies to SRX300, SRX320, SRX340, SRX345, SRX550M, SRX1500, SRX4100, SRX4200, and SRX4600 devices and vSRX instances, and to SRX5400, SRX5600, and SRX5800 devices configured for AutoVPN.

distinguished-name Specify a distinguished name as the identifier for the remote gateway with a dynamic IP address.

general-ikeid Disables IKE ID validation. If this option is enabled, the new iked process skips the IKE ID validation. After skipping the IKE ID validation, the new iked process still continues the authentication as per the IKE standard. `general-ikeid` is an optional configuration statement.

hostname Name by which a network-attached device is known on a network. A fully qualified domain name (FQDN), or partial FQDN that can be matched to a peer's X.509 PKI certificate. A partial FQDN is matched to the right-most part of the alternate subject field in the peer device's certificate. For example, the partial FQDN example.net can match devices with host1.example.net or host2.example.net in the alternate subject field of their certificates. Note that the partial FQDN example.net does not match host1.example.network.com or host2.net.com because example.net is not the right-most value in the alternate subject field. For AutoVPN, a partial FQDN combined with ike-user-type group-ike-id can be used to identify a specific remote user or peer when there are multiple peers that share a common domain name.

ike-user-type Configure the type of IKE user for a remote access connection.

- Values:
  - group-ike-id—E-mail address or fully qualified domain name (FQDN) shared by a group of remote access users so that each user does not need to configure a separate IKE profile. When group IKE IDs are configured, the IKE ID of each user is a concatenation of a user-specific part and a part that is common to all group IKE ID users. For example, the user Bob might use ”Bob.example.net“ as his full IKE ID, where ”.example.net“ is common to all users. The full IKE ID is used to uniquely identify each user connection. Group IKE IDs require the generation of a unique preshared key based on the username supplied during VPN connection, which can be viewed with the `show security ike pre-shared-key` command.
  - shared-ike-id—E-mail address shared by a large number of remote access users so that each user does not need to configure a separate IKE profile. When a shared IKE ID is configured, all users share a single IKE ID and a single IKE preshared key. Each user is authenticated through the mandatory XAuth phase, where the credentials of individual users are verified either with an external RADIUS server or with a local access database. XAuth is required for shared IKE IDs.

inet Use an IPV4 address to identify the dynamic peer.

inet6 Use an IPV6 address to identify the dynamic peer.

reject-duplicate-connection Reject new connection from duplicate IKE-id.

user-at-hostname Use an e-mail address.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement modified in Junos OS Release 8.5. Support for the `inet6` option added in Junos OS Release 11.1.

`general-ikeid` option under `[edit security ike gateway gateway-name dynamic]` hierarchy is introduced in Junos OS Release 21.1R1.

dynamic (Source Packet Routing)

IN THIS SECTION

- Syntax | 6156
- Hierarchy Level | 6156
- Description | 6157
- Options | 6157
- Required Privilege Level | 6157
- Release Information | 6157

Syntax

```
dynamic {
    protected {
        mandatory;
    }
    unprotected {
        mandatory;
    }
}
```

Hierarchy Level

```
[edit protocols source-packet-routing segment-list]
```

Description

Enable dynamic computation of segment routing label-switched paths (LSPs) based on tunnel destination and translation service to fetch the corresponding segment identifiers (SIDs).

NOTE:

When the dynamic statement is enabled, all the next hops must have an IP address assigned as a minimum configuration. In the case of segment-lists, if a next hop has both IP address and label configured, then the configured label is retained.

NOTE:

- Because translation service use IGP instance of traffic-engineered database (TED), you must include the `igp-topology` statement at the `[edit protocols isis traffic-engineering]` hierarchy level for successful translation.
- The `auto-translation` and `dynamic` statements are mutually exclusive, and only either of them can be configured under a segment-list.

Options

protected (Optional) Ensures a protected adjacency SID is used for the links of the LSP.

unprotected (Optional) Ensures an unprotected adjacency SID is used for the links of the LSP.

mandatory (Optional) Enabled translation to fail if the specified type of adjacency SID cannot be found for a link. This option does not have effect on node SIDs.

Required Privilege Level

routing

- Required Privilege Level | 6159
- Release Information | 6159

Syntax

```
dynamic-tunnel-gre-key dynamic-tunnel-gre-key;
```

Hierarchy Level

```
[edit routing-options dynamic-tunnels tunnel-attributes]
```

Description

Enable traffic flow identification by configuring a GRE key that will be used to identify an individual traffic flow in a GRE tunnel. RFC2890 describes the enhancements to the GRE header that includes the key field and its use in identifying individual traffic flow in a tunnel. The encapsulating router uses the GRE key to encapsulate the packets for a particular traffic flow. The decapsulating router uses the GRE key to identify and decapsulate those packets for that traffic flow.

The key must be configured on the routers on both endpoints of a tunnel and a policy must be created and exported to populate the key in the forwarding table.

Options

dynamic-tunnel-gre-key An identifier for a individual traffic flow within a GRE tunnel.

- **Range:** 1 through 4,294,967,295.

Required Privilege Level

```

Description

Configure a dynamic tunnel between two PE routers.

> **NOTE**: ACX Series routers do not support the `gre` statement.

Configure dynamic IPv4-over-IPv6 tunnels and define their attributes to forward IPv4 traffic over an IPv6-only network. IPv4 traffic is tunneled from customer premises equipment to IPv4-over-IPv6 gateways. You must also configure `extended-nexthop` option at `[edit protocols bgp family inet unicast]` hierarchy level to allow BGP to route IPv4 address families over an IPv6 session.

Options

bgp-signal Enable the creation of a tunnel signaled by BGP.

gre Enable dynamic generic routing encapsulation type tunnel mode for IPv4.

- Values:
  - `next-hop-based-tunnel`—Enable next hop base dynamic-tunnel for steering IPv4 traffic with IPv6 next hop address.

ipip Enable dynamic IP in IP encapsulation type tunnel mode for IPv4

- Values:
  - `full-resolved-next-hop-based-tunnel`—Enable fully resolved next hop base dynamic-tunnel for steering IPv4 traffic with IPv6 next hop address.

source-address	Specify the source address of the tunnel.
tunnel-name	Name of the dynamic tunnel.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

`bgp-signal` option introduced in Junos OS Release 17.4R1.

}
```

Hierarchy Level

```
[edit security]
```

Description

Configure the dynamic VPN feature. The dynamic VPN feature simplifies remote access by enabling users to create IPsec VPN tunnels without having to manually configure settings on their PCs or laptops. This feature is supported on SRX300, SRX320, SRX340, SRX345, and SRX550HM devices.

In Junos OS Release 21.4R1, we’ve deprecated the `dynamic-vpn` configuration statement and we might remove it completely in a future release.

Options

access-profile Specify the access profile to use for Extended Authentication for remote users trying to download the Access Manager. This feature is supported on SRX300, SRX320, SRX340, SRX345, and SRX550HM devices.

clients Create a client configuration for the dynamic VPN feature.

config-check Enable extra dynamic VPN configuration checking. If you include this statement in your configuration, it is automatically enabled. If the statement is not present in your configuration, the configuration check option is not enabled. This feature is supported on SRX300, SRX320, SRX340, SRX345, and SRX550HM devices.

force-upgrade Force upgrade.the dynamic vpn.

interface Specify a list of interfaces to set the interfaces that allow access to dynamic VPN, separated by spaces. This feature is supported on SRX300, SRX320, SRX340, SRX345, and SRX550HM devices.

traceoptions Configure dynamic VPN tracing options.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release Release 9.5.

`config-check` and `interface` options introduced in Junos OS Release 12.1X44-D10.

enhanced-scale (IRB Interface)

IN THIS SECTION

- Syntax | 6175
- Hierarchy Level | 6175
- Description | 6175
- Options | 6175
- Required Privilege Level | 6176
- Release Information | 6176

Syntax

```
interface irb.<unit> {
    enhanced-scale;
}
```

Hierarchy Level

```
[edit interfaces irb unit <unit>]
```

Description

Enable the IRB interface to allocate Next Hop Identifiers (NHId) from the extended space, thereby supporting up to 1.5 million ARP/ND unicast next hop entries. This feature is essential for environments requiring a high scale of next hop entries.

Options

unit: The logical unit number for the IRB interface.

- Range: `<unit>` specifies the logical unit number.
- Default: None

- Syntax: <unit>
- Values: Any valid logical unit number.

Required Privilege Level

admin: To view this statement in the configuration.

Release Information

admin-control: To add this statement to the configuration.

e1-options (BITS Interfaces Signal Type)

IN THIS SECTION

- Syntax | 6176

e2e-transparent

IN THIS SECTION

- Syntax | 6179
- Hierarchy Level | 6179
- Description | 6180
- Options | 6180
- Required Privilege Level | 6180
- Release Information | 6180

Syntax

```
e2e-transparent;
```

Hierarchy Level

```
[edit protocols ptp]
```

Description

> **NOTE**: If IGMP snooping is enabled on routers and switches that are configured with a PTP Transparent Clock, the PTP devices will not perform an IGMP join on 224.0.1.129. You will need to configure a static IGMP configuration in order to forward the PTP traffic.
>
> For example:
>
> ```
> set protocols igmp-snooping vlan vlan-name interface interface-name static group 224.0.1.129
> ```

Configure the end-to-end (E2E) transparent clock for Precision Time Protocol (PTP). With an end-to-end transparent clock, only the residence time is included in the timestamp in the packet. Transparent clock functionality is supported on PTP over Ethernet, IPv4, IPv6, unicast, and multicast. With PTP over Ethernet, one or two VLANs are supported. Transparent clock functionality is enabled globally and might be required in scenarios in which the interface on which packets are received and transmitted is unknown.

> **NOTE**: ACX5048 and ACX5096 routers do not support PTP over IPv6 for transparent clocks.

Options

There are no options.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

eapol-address (MACSec)

IN THIS SECTION

- Syntax | 6181
- Hierarchy Level | 6181
- Description | 6181
- Default | 6182
- Options | 6182
- Required Privilege Level | 6182
- Release Information | 6182

Syntax

```
eapol-address (pae | provider-bridge | lldp-multicast | destination unicast-address);
```

Hierarchy Level

```
[edit security macsec connectivity-association connectivity-association-name mka]
```

Description

Configure an EAPoL destination MAC address. The `eapol-address` *pae* is the default configuration.

To establish a MACsec session, MACsec Key Agreement PDUs (MKPDUs) are sent or received between nodes. These PDUs are Extensible Authentication Protocol over LAN (EAPoL) packets and, by default, their destination MAC address is the EAPoL multicast address 01:80:C2:00:00:03.

If the nodes are connected through a provider network, the multicast packets might be consumed or dropped, depending on their configuration. To overcome this issue, you can configure the destination MAC address. The configuration must match on both peer nodes to establish the MACsec session.

NOTE:

- The `pae`, `provider-bridge`, and `lldp-multicast` options are multicast addresses. You can configure a unicast address using the `destination` option.
- It is assumed that the adjacency between both the nodes is guaranteed by the provider network. The MKPDUs are not VLAN-tagged and include multicast address as their destination address. It is also also assumed that the provider network has a configuration to transfer the untagged MKPDUs to the destination node.

Default

Port Access Entity (PAE) group address (01:80:C2:00:00:03).

Options

`pae`	The Port Access Entity option is mapped to MAC address 01:80:C2:00:00:03. Do not use if 802.1X authentication is configured on the provider network.
`provider-bridge`	The provider bridge option is mapped to MAC address 01:80:C2:00:00:00. Do not use if STP/RSTP/MSTP protocols are configured on the provider network.
`lldp-multicast`	The Link Level Discovery Protocol multicast option is mapped to MAC address 01:80:C2:00:00:0E. Do not use if LLDP is configured on the provider network.
`destination` ***`unicast-address`***	The unicast address option is a configurable MAC address.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 18.2R1.

Option for destination unicast address introduced in Junos OS Release 19.3R1 for MX Series routers.

Configuring Advanced MACsec Features

eapol-block

IN THIS SECTION

- Syntax | 6183
- Hierarchy Level | 6183
- Description | 6184
- Default | 6184
- Options | 6184
- Required Privilege Level | 6185
- Release Information | 6185

Syntax

```
eapol-block {
    captive-portal;
    mac-radius;
    server-fail <seconds>;
}
```

Hierarchy Level

```
[edit logical-systems name protocols dot1x authenticator interface (all | interface-names)],
[edit logical-systems name protocols dot1x authenticator interface (all | interface-names) (server-reject-bridge-domain | server-reject-vlan)],
[edit protocols dot1x authenticator interface (all | interface-names)],
[edit protocols dot1x authenticator interface (all | interface-names) (server-reject-bridge-domain | server-reject-vlan)]
```

Description

Enable the device to ignore Extensible Authentication Protocol over LAN (EAPoL)-Start messages received from a client that has been authenticated so that the device does not trigger re-authentication. The device typically attempts to restart the authentication procedure by contacting the authentication server when it receives an EAPoL-Start message from a client—even for authenticated clients. You can configure the `eapol-block` statement to help prevent unnecessary downtime that can occur when the device waits for a response from the authentication server.

If you configure the device to block EAPoL-Start messages, when the device receives an EAPoL-Start message from an authenticated client, the device ignores the message and does not attempt to contact the authentication server for reauthentication. The existing authentication session that was established for the client remains open.

The EAPoL-Start messages are blocked only if the client is in the authenticated state. EAPoL-Start messages from new clients are accepted.

Default

If the `eapol-block` statement is not configured, the device attempts to contact the authentication server to authenticate the client when it receives an EAPoL-Start message.

Options

`captive-portal` Configure the device to ignore EAPoL-Start messages received from a client that has been authenticated using captive portal authentication.

`mac-radius` Configure the device to ignore EAPoL-Start messages received from a client that has been authenticated using MAC RADIUS authentication. The `mac-radius` option is also valid for clients authenticated using central Web authentication (CWA).

`server-fail` <*seconds*> Configure the device to ignore EAPoL-Start messages received from a client that has been authenticated using server fail fallback or server reject VLAN methods. Optionally, configure the time interval, in seconds, during which the device will not attempt to contact the authentication server to re-authenticate a client that has already been authenticated using server fail fallback.

- **Default:** 120 seconds.
- **Range:** 120 through 65,535 seconds.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.2.

Support at the [`edit protocols dot1x authenticator interface` *`interface-name`*] hierarchy level introduced in Junos OS Releases 14.1X53-D40 and 15.1X53-D51 for EX Series switches.

`captive-portal` and `mac-radius` introduced in Junos OS Release 17.2R1.

east-interface

IN THIS SECTION

Syntax | 6187
Hierarchy Level | 6187

- Description | 6187
- Required Privilege Level | 6188
- Release Information | 6188

Syntax

```
east-interface {
    node-id mac-address;
    control-channel channel-name {
        vlan number;
        interface name interface-name
    }
    interface-none
    ring-protection-link-end;
}
```

Hierarchy Level

```
[edit protocols protection-group ethernet-ring ring-name]
```

Description

Define one of the two interface ports for Ethernet ring protection, the other being defined by the `west-interface` statement at the same hierarchy level. The interface must use the control channel's logical interface name. The control channel is a dedicated VLAN channel for the ring port.

EX Series switches do not use the node-id statement--the node ID is automatically configured on the switches using the MAC address.

NOTE: Always configure this port first, before configuring the `west-interface` statement.

NOTE: The Node ID is not configurable on EX Series switches. The node ID is automatically configured using the MAC address.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.4.
Statement introduced in Junos OS Release 12.1 for EX Series switches.
Statement introduced in Junos OS Release 14.153-D10 for QFX Series switches.

echo-req

IN THIS SECTION

- Syntax | **6189**
- Hierarchy Level | **6189**
- Description | **6189**
- Options | **6189**
- Required Privilege Level | **6190**

Release Information | 6190

Syntax

```
echo-req {
    alarm-threshold (Security GPRS) {
        forward number;
        reverse number;
    }
    drop-threshold (Security GPRS) {
        forward number;
        reverse number;
    }
}
```

Hierarchy Level

```
[edit security gtp profile profile-name path-rate-limit message-type]
```

Description

Configure the echo-req parameter to limit the number of packets per minute for the GPRS tunneling protocol (GTP) echo request.

From Junos OS Release 20.4R1 onwards, the `[edit security gprs gtp profile profile-name path-rate-limit message-type]` hierarchy level is replaced by `[edit security gtp profile profile-name path-rate-limit message-type]`.

Options

`alarm-threshold`—To set alarm threshold for path rate limiting.

`drop-threshold`—To set drop threshold for path rate limiting.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1X45-D10.

ecmp

IN THIS SECTION

- Syntax | 6190
- Hierarchy Level | 6191
- Description | 6191
- Required Privilege Level | 6191
- Release Information | 6191

Syntax

```
ecmp;
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols ldp oam bfd-liveness-detection],
[edit logical-systems logical-system-name protocols ldp oam fec address bfd-liveness-detection],
[edit protocols ldp oam bfd-liveness-detection],
[edit protocols ldp oam fec address bfd-liveness-detection]
```

Description

Allows LDP to establish BFD sessions for all ECMP paths configured for the specified FEC. If you configure the `ecmp` statement, you must also configure the `periodic-traceroute` statement for the specified FEC. If you do not do so, the commit operation fails. You can configure the `periodic-traceroute` statement at the global hierarchy level (`[edit protocols ldp oam]`) while only configuring the `ecmp` statement for a specific FEC (`[edit protocols ldp oam fec address bfd-liveness-detection]`).

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

RELATED DOCUMENTATION

Configuring ECMP-Aware BFD for LDP LSPs

ecmp-alb

IN THIS SECTION

- Syntax | 6192
- Hierarchy Level | 6192

- Description | 6192
- Options | 6192
- Required Privilege Level | 6193
- Release Information | 6193

Syntax

```
ecmp-alb {
    apply-groups;
    apply-groups-except;
    tolerance;
}
```

Hierarchy Level

```
[edit chassis]
```

Description

Enable adaptive load balancing for equal-cost multipath (ECMP) next hops.

NOTE: The `ecmp-alb` statement can be enabled only when the `[edit chassis network-services enhanced-ip]` statement is configured.

Starting in Junos OS Release 20.1R1, you can configure adaptive load balancing for ECMP next hops on multiple Packet Forwarding Engines on the same line card for even distribution of the traffic and redundancy.

Options

`apply-groups`—Specify the groups from which to inherit configuration data.

`apply-groups-except`—Specify the groups from which configuration data should not be inherited.

`tolerance`—Specify the adaptive tolerance in percentage.

- **Default:** 20%.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.2.

ecmp-fast-reroute

IN THIS SECTION

- Syntax | 6193
- Hierarchy Level | 6193
- Description | 6194
- Required Privilege Level | 6194
- Release Information | 6194

Syntax

```
ecmp-fast-reroute;
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-options forwarding-table ],
[edit routing-options forwarding-table]
```

Description

Enables equal-cost multipath (ECMP) fast reroute protection. If a link fails, ECMP uses fast reroute protection to shift packet forwarding to operational links to reduce packet loss. Fast reroute protection updates ECMP information for the interface without waiting for route table updates. When the next route table update occurs, a new set of ECMP interfaces are added with fewer links, or the route points to a single next hop.

Without ECMP fast reroute protection, upon link failure the creation of the new ECMP set is delayed while the routing table information is updated. Once the new ECMP set is created, the hashing algorithm calculates new paths. Enabling the `ecmp-fast-reroute` option eliminates the routing table convergence delay.

ECMP is a global configuration and will impact only the nexthop addresses learnt after the ECMP configuration. However, the existing nexthop addresses are not impacted. Therefore, you must either remove the existing configuration and restore it along with the fast reroute configuration or you can restart routing or the linecard. You can also reboot the device to add the ECMP fast reroute links for the existing nexthop addresses.

> **NOTE**: ECMP works differently with indirect next hops. Please see *ECMP Flow-Based Forwarding* for more information.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Command introduced before Junos OS Release 17.4.

```

Description

By default, equal cost multi-path (ECMP) traffic flows are distributed more-or-less equally between forwarding next-hops. Enable `ecmp-local-bias` to have ECMP traffic prefer local forwarding next-hops (that is, local to the packet forwarding engine (PFE) that is performing the packet look up) over remote ones, and to distribute the flows among local members. Local bias percentages cannot be assigned. Note that `ecmp-local-bias` is not intended to be used in conjunction with any other load balancing schemes.

This feature applies chassis-wide. It supports BGP prefixes that are directly reachable with IPv4 MPLS ECMP next-hops on Gigabit Ethernet (ge-) and 10-Gigabit Ethernet (xe-) interfaces. Multicast traffic is not affected.

Use `ecmp-local-bias` when you need to direct ECMP traffic towards local links, for example, to ensure that the overall load on the fabric is reduced.

> **NOTE**: For packet forwarding engine (PFE) to achieve the functionality of ECMP local bias, the dependent config knob of ecmp-fast-reroute is required. In MX platforms, `ecmp-fast-reroute` configuration command is available as an explicit router configuration.

Default

```

Description

For Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), or Multiple Spanning Tree Protocol (MSTP), configure interfaces as edge ports or edge interfaces. Edge ports do not expect to

receive BPDUs. If a BPDU is received, the port becomes a non edge port unless `set protocols (vstp|rstp|mstp) bpdu-block-on-edge` is configured.

> **NOTE**: Although the `edge` configuration statement appears in the [`edit protocols stp interface (all | interface-name)`] or [`edit protocols rstp force-version stp interface (all | interface-name)`] hierarchy on the switch, this statement has no effect on the switch operation if you configure it.

Default

Edge interfaces are not enabled.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.4.

Statement updated in Junos OS Release 9.4 for EX Series switches to add VSTP support.

Support for logical systems added in Junos OS Release 9.6.

egress (Buffer Configuration)

IN THIS SECTION

- Syntax | 6208
- Hierarchy Level | 6209
- Description | 6209
- Default | 6209
- Options | 6209
- Required Privilege Level | 6210
- Release Information | 6210

Syntax

```
egress {
    percent percent;
    buffer-partition (lossless | lossy | multicast) {
        percent percent;
```

```
    }
}
```

Hierarchy Level

```
[edit class-of-service shared-buffer]
```

Description

Configure the global shared buffer pool allocation for egress traffic. The system allocates the shared buffer pool dynamically across its ports as the ports require memory space. Some buffer space is reserved for other buffers such as dedicated buffers (buffers allocated permanently to ports).

The percentage you specify is the percentage of available (user-configurable) buffer space allocated to the global shared egress buffer pool. If you allocate less than 100 percent of the available buffer space to the shared buffer pool, the remaining buffer space is added to the dedicated buffer pool. (You cannot directly configure the dedicated buffer pool for each port; dedicated buffers are allocated evenly across all the ports. However, on a port, you can configure the portion of dedicated port buffer space allocated to each queue in the scheduler configuration using the `buffer-size` option.)

> **CAUTION**: Changing the buffer configuration is a disruptive event. Traffic stops on *all* ports until buffer reprogramming is complete.

You can also partition the shared buffer pool to adjust the egress buffer allocations for different mixes of network traffic using the `buffer-partition` statement.

Default

The default shared buffer percentage is 100 percent. (All available buffer space is allocated to the shared buffer pool.)

Options

`percent` *percent*—Percentage of available egress buffer space allocated to the shared buffer pool. If the percentage is less than 100 percent, the remaining buffer space is allocated to the dedicated buffer pool.

The remaining statement is explained separately. See CLI Explorer.

Required Privilege Level

interfaces—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3.

egress-chaining

IN THIS SECTION

- Syntax | 6211
- Hierarchy Level | 6211
- Description | 6211
- Options | 6211
- Required Privilege Level | 6212
- Release Information | 6212

Syntax

```
egress-chaining {
    spring-te;
}
```

Hierarchy Level

```
[edit routing-options forwarding-table]
```

Description

Enable egress chaining for devices that support a maximum of two labels push at the ingress. You can configure egress chaining to implement more than two labels push using a composite next hop at the egress and pass a pointer from the ingress to the egress about the location of its label stack. Route pointing to this next hop chain can be IPv4, IPV6, or an MPLS label (binding segment ID).

NOTE:

- Label push at the egress should ensure that they are pushed ahead of any other labels programmed at the egress.
- Egress chaining is possible for one chain only. Any more composite next hops after egress chaining are flattened into forwarding next hops.
- Junos OS release 20.4R1 supports only a single egress chain.

Options

spring-te Enable egress chaining for segment routing traffic-engineered (SPRING-TE) routes.

When you configure the `spring-te`, you set the egress chain flag in the SPRING-TE route's next hop. This enables installation of a composite next hop in the egress Packet Forwarding Engine (PFE).

NOTE: Ensure that you do not resolve the SPRING-TE route further over another composite next hop when the `spring-te` option is enabled.

Required Privilege Level

routing

egress-shaping-overhead

IN THIS SECTION

- Syntax | 6223
- Hierarchy Level | 6223
- Description | 6223
- Options | 6224
- Required Privilege Level | 6224
- Release Information | 6225

Syntax

```
egress-shaping-overhead number;
```

Hierarchy Level

```
[edit chassis fpc slot-number pic pic-number traffic-manager],
[edit chassis lcc number fpc slot-number pic pic-number traffic-manager]
```

Description

Number of bytes to add to packet to determine shaped session packet length.

NOTE: On M Series and T Series routers with Gigabit Ethernet Intelligent Queuing 2 (IQ2) PICs and Enhanced IQ2 (IQ2E) PICs and on MX Series routers with Dense Port Concentrators (DPCs) only, to account for egress shaping overhead bytes added to

output traffic on the line card, you must use the `egress-policer-overhead` statement to explicitly configure corresponding egress policing overhead for Layer 2 policers, MAC policers, or queue rate limits applied to output traffic on the line card.

NOTE: For MIC and MPC interfaces on MX Series routers, by default the value of `egress-shaping-overhead` is configured to 20, which means that the number of class-of-service (CoS) shaping overhead bytes to be added to the packets is 20. The interfaces on DPCs in MX Series routers, the default value is zero. For interfaces on PICs other than the 10-port 10-Gigabit Oversubscribed Ethernet (OSE) Type 4, you should configure `egress-shaping-overhead` to a minimum of 20 bytes to add a shaping overhead of 20 bytes to the packets.

NOTE: When you change the `egress-shaping-overhead` value, on M Series, T Series, and MX104 routers the PIC on which it is changed is restarted. On MX5 routers, the MIC on which it is changed is restarted. On other MX Series routers, the DPC/MPC on which it is changed is restarted.

Options

number—When traffic management (queuing and scheduling) is configured on the egress side, the number of CoS shaping overhead bytes to add to the packets on the egress interface.

Range:

- –63 through 192.
- –62 through 192 for vSRX Virtual Firewall.

NOTE: The L2 headers (DA/SA + VLAN tags) are automatically a part of the shaping calculation.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

```

Description

Enable egress peer engineering to direct core service traffic such as MPLS RSVP to a specific single-hop egress BGP peer. The ingress BGP peer can traffic-engineer the core inet unicast and inet6 unicast service traffic using BGP labeled unicast towards a specific egress BGP peer, which is also the AS boundary router.

You can enable MPLS fast reroute (FRR) on the egress BGP peer, which has traffic engineering enabled. The AS boundary router switches to the backup path when the primary link fails. Specify a predefined template with one or more backup paths. You can define a template using the "egress-te-backup-paths" on page 6232 configuration statement and configure one or more backup path for MPLS FRR. The backup paths specified in the template must belong to the same address family as the BGP peer.

Options

none	Enable traffic engineering on the egress peer.
backup-path ***backup-path***	(Optional) Specify a predefined template that has the configured backup path for MPLS fast reroute.

import	Import policy to set attributes on the egress-te created route.
install-address	Host (/32 or /128) address to install egress-te route in inet[6].3 table.
no-install	Avoid installation to FIB or resolving over egress-te route.
rib (inet.0 | inet6.0)	Install egress-te route in inet[6].0 instead of inet[6].3

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.2R4.

```

Description

Specify a BGP peer adjacency segment for only multihop EBGP peers. You can specify a segment set so that the packet is sent to any member in the set, which is the equal-cost multipath next hop. You can include an adjacent segment or a node segment to the same peer segment set. You must configure "egress-te-node-segment" on page 6234 before configuring the BGP peer adjacency segment.

name Specify a name for the peer adjacency segment.

Options

egress-te-backup-ip-forward *instance-name*
Specify a routing-instance name to use the IP forward backup path for egress TE.

egress-te-backup-segment label *label-value*
Specify the backup label value for a segment for MPLS fast reroute. The label must already be associated with a segment and must be different from the protected segment specified with the "egress-te-node-segment" on page 6234 or "egress-te-adj-segment" on page 6229 statement.

egress-te-set *set-name* **weight** *weight*
Specify the name of the segment set configured with the"egress-te-set-segment" on page 6236 statement. You can include both node segments and adjacency segments in the same segment set. The egress router advertises the peer node SID label for all its peers including the EBGP peers and the controller advertises these SID labels to the ingress router.

- **Range:** weight: 1 through 255

label *label-value*
Specify a label from the static label range for the peer adjacency segment.

next-hop *next-hop-address*
Specify a directly connected next-hop address for the peer adjacency segment.

egress-te-link-attribute
Specify the link attribute for BGP EPE link delay metrics for path computation.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 18.4R1.

`egress-te-backup-ip-forward` option introduced in Release 20.1R1.

`delay-metric <value>` option introduced in Junos os Release 21.4R1.

```

Description

Specify backup paths for MPLS fast reroute (FRR) on an egress peer, which has traffic engineering enabled. Egress peer engineering directs core service traffic such as MPLS RSVP to a specific egress BGP peer. The ingress BGP peer can traffic-engineer the core inet unicast and inet6 unicast service traffic using BGP labeled unicast towards a specific egress BGP peer, which is also the AS boundary router.

Specify a backup path through another directly connected external BGP peer. The configured backup path provides MPLS fast reroute when the primary link fails, and the AS boundary router redirects the traffic received from the core to the this backup path. You can configure more than one backup path on the egress BGP peer. The specified backup paths are automatically installed into the MPLS forwarding table of the egress BGP peer configured with the egress traffic engineering feature.

Options

template *path-name*

Define a template that can be reused by multiple BGP groups or peers. All addresses listed in one template must belong to the same IP address family as the protected device that is the egress BGP peer.

ip-forward *rti-name*

(Optional) Configure this option if you want the egress peer to perform an IP look up in the `inet6.0` table for backup path that egress BGP peer must use for faster reroute You can optionally specify a routing instance. If you do not specify a routing instance, the device configures the backup path for the master instance.

You cannot use this option with the `remote-nexthop` option.

> **CAUTION**: `ip-forward` option might cause forwarding loops if the IP route chooses an internal path. To avoid forwarding loops configure a virtual routing and forwarding (VRF) instance with leaked external routes only, and use this VRF instance with the `ip-forward` option.

peer *peer-addr*

(Optional) Specify another directly connected external BGP peer that the device must use for faster reroute when the primary link fails. Each template can specify one or more external BGP peers.

remote-nexthop *remote-nh-addr*

(Optional) Specify a remote next-hop address if transit peering is not available locally to tunnel traffic to another AS boundary router in the local AS that has transit connectivity. The specified remote next-hop address must have the ability to forward this redirected traffic to its destination. This option does not support multiple routing instances; therefore, do not use this option with the `ip-forward` option.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.2 R4.

[edit routing-instances name protocols bgp group name neighbor],
[edit tenants name routing-instances name protocols bgp group name neighbor]
```

Description

Specify a BGP peer node segment for both single hop and multihop EBGP peers. You can configure a node segment as a member of a segment set so that the packet is sent to any member that is the ECMP next hop in the set. Before configuring a node segment as a member of a segment set, you must create a segment set first. If you fail to create the segment set before assigning a node segment, the commit might fail.

This configuration enables egress peer engineering using BGP link-state distribution in a network configured with segment routing. The egress router advertises the peer node SID label for all its peers and the controller advertises these SID labels to the ingress router.

Options

egress-te-backup-ip-forward *instance-name*

Specify a routing-instance name to use the IP forward backup path for egress TE.

egress-te-backup-segment label *label-value*

Specify the backup label value for a segment for MPLS fast reroute. The label must already be associated with a segment and must be different from the protected segment specified with the "egress-te-node-segment" on page 6234 or "egress-te-adj-segment" on page 6229 statement.

egress-te-set *set-name* weight *weight*

Specify the name of the segment set configured with the"egress-te-set-segment" on page 6236 statement. You can include both node segments and adjacency segments in the same segment set. The egress router advertises the peer node SID label for all its peers including the EBGP peers and the controller advertises these SID labels to the ingress router.

- **Range:** weight: 1 through 255

label *label-value* Specify a label from the static label range for the peer node segment.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 18.4R1.

egress-quantization

IN THIS SECTION

- Syntax | 6238
- Hierarchy Level | 6239
- Description | 6239
- Default | 6240
- Options | 6241
- Required Privilege Level | 6241
- Release Information | 6241

Syntax

```
egress-quantization
```

Hierarchy Level

```
[edit forwarding-options enhanced-hash-key ecmp-dlb]
```

Description

Selective dynamic load balancing selects an optimal link based on:

- Port load metric - Amount of traffic in bytes transmitted in recent past over each ECMP link.
- Port queue metric - Amount of traffic in number of cells enqueued on each ECMP link for transmission.

Use `egress-quantization` to configure the desired ratio of port load metric to port queue metric based on the traffic pattern. Member link quality is quantized in the range of 0 to 7. A link quality value of 0 indicates the worst quality link whereas a value of 7 indicates a best quality link. Quantization levels can be configured by setting minimum and maximum thresholds along with rate-weightage.

Rate-weightage is the ratio of port load metric to port queue metric. Assume rate-weightage is configured as 60%. Then a link is chosen amongst competing links if the link has a higher port load metric than its port queue metric.

Minimum threshold is the minimum bandwidth threshold level of the total link bandwidth. When bandwidth level drops below this level, the device assigns this link with a best quality band value (value 7). Assume the value set is 20. When the ECMP link transmits traffic lower than 20% of link bandwidth, the device assigns a best quality band value to this link.

Maximum threshold is the maximum bandwidth threshold level of the total link bandwidth. When bandwidth level rises above this level, the device assigns this link with a worst quality band value (value 0). Assume the value is set to 80. When the ECMP link transmits traffic higher than 80% of the link bandwidth, the device assigns worst quality band value to this link.

The following table summarizes egress quantization link quality values.

Table 32: Egress quantization link quality values

Egress quantization when egress rate weightage is configured with value of 100%	
Egress Link Bandwidth utilization	Quality Band
Lesser than 20	7 (Best)

Table 32: Egress quantization link quality values *(Continued)*

Egress quantization when egress rate weightage is configured with value of 100%	
Egress Link Bandwidth utilization	Quality Band
21-30	6
31-40	5
41-50	4
51-60	3
61-70	2
71-80	1
Greater than 80	0 (Worst)

Default

When selective dynamic load balancing is configured, the default ratio of port load metric to port queue rate weightage is 50:50 for per-packet mode and flowlet-mode. The default values of minimum threshold value and maximum threshold value are:

Per-packet mode

- EgressBytes Min Threshold - 80
- EgressBytes Max Threshold - 99

Flowlet mode

- EgressBytes Min Threshold - 20
- EgressBytes Max Threshold - 50

Options

- apply-groups
- max
- min
- rate-weightage

enable (Enhanced Subscriber Management)

IN THIS SECTION

Syntax | 6258

- Hierarchy Level | 6258
- Description | 6258
- Required Privilege Level | 6258
- Release Information | 6258

Syntax

```
enable (force);
```

Hierarchy Level

```
[edit system services subscriber-management]
```

Description

Enable the Junos OS enhanced subscriber management software architecture to support configuration of dynamic interfaces and services for subscriber management. To use dynamic profiles and authentication to create and manage dynamic subscriber interfaces and services, you must enable enhanced subscriber management and reboot the router.

Use the `force` option to enable packet triggered recovery support for static VLAN subscribers.

Options
force – Enable packet triggered recovery support for static VLAN subscribers.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1R3.

enable-extended-ql-tlv

IN THIS SECTION

- Syntax | 6260
- Hierarchy Level | 6260
- Description | 6261
- Options | 6261
- Required Privilege Level | 6262
- Release Information | 6262

Syntax

```
enable-extended-ql-tlv;
```

Hierarchy Level

```
[edit chassis synchronization]
```

Description

Enable enhanced synchronous Ethernet equipment clock (eEEC). eEEC supports new clocks with different Quality Levels (QLs) in the Synchronous Ethernet chain and transmits ESMC with extended QL TLV.

An extended QL TLV for eEEC provides the following three combinations of clocks:

- eEEC with extended QL TLV support
- EEC with no extended QL TLV support
- EEC with extended QL TLV support.

The extended QL TLV allows the count of the number of cascaded eEEC and EEC clocks. This also allows clocks that support enhanced ESMC messages to report the presence of clocks with discarded TLVs.

Options

quality-level

The available quality levels are as follows:

Table 33: Quality Levels

Quality Level	Description
PRTC	Timing quality of a primary reference time clock (option-1/option-2).
eEEC	Timing quality of an enhanced Ethernet equipment clock (option-1/option-2).
ePRC	Timing quality of an enhanced primary reference clock (option-1/option-2).
ePRTC	Timing quality of an enhanced primary reference time clock (option-1/option-2).
prc	Timing quality of a primary reference clock (option-1 only).
prs	Clock traceable to a primary reference source (option-2 only).

Table 33: Quality Levels *(Continued)*

Quality Level	Description
sec	Timing quality of an SDH equipment clock (option-1 only).
smc	Clock traceable to a self-timed SONET (option-2 only).
ssu-a	Timing quality of a type I or IV client clock (option-1 only).
ssu-b	Timing quality of a type VI client clock (option-1 only).
st2	Clock traceable to Stratum 2 (option-2 only).
st3	Clock traceable to Stratum 3 (option-2 only).
st3e	Clock traceable to Stratum 3E (option-2 only).
st4	Clock traceable to Stratum 4 free-run (option-2 only).
stu	Clock traceable to an unknown quality (option-2 only).
tnc	Clock traceable to a transit node clock (option-2 only).

If you do not configure the quality level and the clock source does not receive ESMC messages, the quality level is set to DNU for network option-1 and DUS for network option-2.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

enable-gtpu-distribution

IN THIS SECTION

- Syntax | 6264
- Hierarchy Level | 6265
- Description | 6265
- Required Privilege Level | 6265
- Release Information | 6265

Syntax

```
enable-gtpu-distribution;
```

Hierarchy Level

```
[edit security forwarding-process application-services]
```

Description

Use the enable-gtpu-distribution option to enable GTP control plane (GTP-C) and GTP user plane (GTP-U) session distribution. This helps to distribute the GTP-C and GTP U traffic on all Services Processing Units (SPUs) by using tunnel-based session distribution, where the GTP-C or the GTP-U traffic of different tunnels is spread across different SPUs.

This option is not enabled by default. You need to enable this option to distribute GTP-U and GTP-C traffic on all SPUs.

If this option is not configured, the GTP ALG will not work properly. GTP-C packets will be processed as normal UDP traffic.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1X49-D40.

enable-ipv6-services-for-lac (L2TP)

IN THIS SECTION

Syntax | 6266

- Hierarchy Level | 6266
- Description | 6266
- Default | 6266
- Required Privilege Level | 6266
- Release Information | 6266

Syntax

```
enable-ipv6-services-for-lac;
```

Hierarchy Level

```
[edit services l2tp]
```

Description

Enable the LAC to create the IPv6 address family (inet6) when establishing a tunnel for subscribers, allowing IPv6 filters to be applied. By default, the LAC requires only family inet to enable forwarding into an IP tunnel. It can apply IPv4 firewall filters to the session. Even when family inet6 is included in the dynamic profile, by default it is not created and IPv6 firewall filters cannot be applied.

Default

Disabled.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

- Release Information | 6269

Syntax

```
(enable-packet-pool | no-enable-packet-pool);
```

Hierarchy Level

```
[edit security idp sensor-configuration global]
```

Description

Enable the packet pool to use when the current pool is exhausted. By default packet pool is enabled.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.2.

enable-performance-mode

IN THIS SECTION

- Syntax | 6269
- Hierarchy Level | 6269
- Description | 6269
- Options | 6270
- Required Privilege Level | 6270
- Release Information | 6270

Syntax

```
enable-performance-mode max-packet-threshold number;
```

Hierarchy Level

```
[edit services application-identification]
```

Description

Set the deep packet inspection (DPI) in performance mode for application identification.

The application traffic throughput can be improved by setting the DPI in performance mode with default packet inspection limit as two packets, including both client-to-server and server-to-client directions. By default, performance mode is disabled on SRX Series Firewalls.

If you want to set DPI to default accuracy mode and disable the performance mode, delete the configuration statement that specifies enabling of the performance mode by using the `delete services application-identification enable-performance-mode` command.

Starting in Junos OS Release 15.1X49-D210R1 and Junos OS Release 19.4R1, the maximum packet threshold for DPI performance mode option is deprecated—rather than immediately removed—to provide backward compatibility and an 6 opportunity to bring your configuration into compliance with the new configuration.

Options

max-packet-threshold *number* Set the maximum packet threshold for DPI performance mode.

- **Range:** 1 through 100
- **Default:** 2

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1X47-D10.

Syntax

```
enable-performance-mode;
```

Hierarchy Level

```
[edit services application-identification]
```

Description

Set the deep packet inspection (DPI) in performance mode for application identification. Performance mode improves application traffic throughput by limiting the maximum DPI processing to four packets per session. This limit includes both client-to-server and server-to-client directions. By default, performance mode is disabled.

Required Privilege Level

view-level—To view this statement in the configuration.

control-level—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.1.

Support for Next Gen Services introduced in Junos OS Releases 19.3R2 and 19.4R1 on MX Series MX240, MX480 and MX960 using the MX-SPC3 services card.

enable-rejoin (Aggregated Multiservices)

IN THIS SECTION

- Syntax | 6272
- Hierarchy Level | 6272
- Description | 6272
- Default | 6273
- Required Privilege Level | 6273
- Release Information | 6273

Syntax

```
enable-rejoin;
```

Hierarchy Level

```
[edit interfaces interface-name load-balancing-options member-failure-options redistribute-all-traffic]
```

Description

Enable the failed member to rejoin the aggregated Multiservices (AMS) interface after the member comes back online.

For many-to-one (N:1) high availability (HA) for service applications like Network Address Translation (NAT), this configuration allows the failed members to rejoin the pool of active members automatically.

Default

If you do not configure this option, then the failed members do not automatically rejoin the `ams` interface even after coming back online.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.4.

Support added in Junos OS Release 19.3R2 for Next Gen Services on MX Series routers MX240, MX480 and MX960 with the MX-SPC3 services card.

enable-reroute-uniform-link-check

IN THIS SECTION

- Syntax | **6274**
- Hierarchy Level | **6274**
- Description | **6274**
- Required Privilege Level | **6274**
- Release Information | **6274**

Syntax

```
enable-reroute-uniform-link-check nat;
```

Hierarchy Level

[set security flow]

Description

Enable retaining an existing session with Network Address Translation (NAT) rule when there is a change in egress interface because of rerouting.

The `enable-reroute-uniform-link-check nat` command is disabled by default.

When the `enable-reroute-uniform-link-check nat` command is enabled:

- If the new egress interface and the previous egress interface are in the same security zone and there is no change in the matched NAT rule or if no rule is applied before and after rerouting, the session is retained with the existing NAT rule.
- If the new egress interface and the previous egress interface are in the same security zone and the matched NAT rule is changed, the session expires.

When the `enable-reroute-uniform-link-check nat` command is disabled:

- If the new egress interface and the previous egress interface are in the same security zone, the traffic is forwarded to the new egress interface.

Required Privilege Level

services—To view this statement in the configuration.

services-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 18.3R1.

RELATED DOCUMENTATION

Understanding NAT Configuration Check on Egress Interfaces after Reroute

enable-reverse-reroute

IN THIS SECTION

- Syntax | 6275
- Hierarchy Level | 6275
- Description | 6275
- Required Privilege Level | 6276
- Release Information | 6276

Syntax

```
enable-reverse-reroute;
```

Hierarchy Level

[edit security zones security-zone *zone-name*]

Description

Reroute the reverse traffic when there is a link switch for the incoming traffic.

When you configure the `enable-reverse-reroute` option for a security zone, then the packets of each session that has been initiated from the zone are checked for the change in the incoming interface. When an incoming packet arrives on an interface that is different from the one cached in session, the route lookup is performed for the reverse path, and the preference is given to the interface on which the packet has arrived when there are ECMP routes available to the source. Ensure that when you configure enable-reverse-reroute option, the new interface on which packets arrive must be part of the same zone as the earlier interface.

You can enable reverse rerouting in hub-and-spoke deployments, where a spoke device uses APBR to re-route the traffic based on the dynamic applications. In such cases reverse re-route can be used on hub device to correctly re-route the reverse traffic.

Required Privilege Level

services—To view this statement in the configuration.

services-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1X49-D123.

enable-session-cache

IN THIS SECTION

- Syntax | 6276
- Hierarchy Level | 6276
- Description | 6277
- Required Privilege Level | 6277
- Release Information | 6277

Syntax

```
enable-session-cache;
```

Hierarchy Level

```
[edit services ssl termination profile profile-name]
[edit services ssl initiation profile profile-name]
```

Description

Enable SSL session cache.

You can enable session caching to cache session information, such as the pre-master secret key and agreed-upon ciphers, for both the client and server.

The cached information is identified by a session ID. In subsequent connections both parties agree to use the session ID to retrieve the information rather than create a new pre-master secret key. Session resumption shortens the handshake process and accelerates SSL transactions there by improves the throughput and maintains an appropriate level of security at the same time.

Required Privilege Level

services—To view this statement in the configuration.

services-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1X44-D10. This statement is supported.

encapsulate-inner-vlan

IN THIS SECTION

- Syntax | 6282
- Hierarchy Level | 6282
- Description | 6282
- Default | 6283
- Required Privilege Level | 6283
- Release Information | 6283

Syntax

```
encapsulate-inner-vlan
```

Hierarchy Level

```
[edit routing-instances routing-instance-name vlans vlan-name vxlan],
[edit vlans vlan-name vxlan]
```

Description

Configure the switch to preserve the original VLAN tag (in the inner Ethernet packet) when performing Virtual Extensible LAN (VXLAN) encapsulation.

Preserving the original VLAN tag is implicit with VLAN bundle services. As a result, in an EVPN-VXLAN environment, you don't need to configure this option with EVPN MAC-VRF instance `vlan-bundle` service type configurations. Explicitly configure this option with other service types if needed.

NOTE: Starting in Junos OS release 23.2R2, you cannot configure the `encapsulate-inner-vlan` statement in a MAC-VRF routing instance if the vlan has an IRB interface associated with it.

NOTE: Starting in Junos OS release 22.3R1, IS-IS logical link control (LLC) packets that are encapsulated in a VXLAN tunnel now have their VLAN tags removed by default. You can configure this option to preserve the VLAN tags on IS-IS LLC packets.

NOTE: ARP suppression is automatically disabled when you encapsulate VLAN traffic for EVPN-VXLAN by configuring `encapsulate-inner-vlan` and its equivalent converse statement `decapsulate-accept-inner-vlan`. As a result, you might observe ARP packets being sent by the device.

Default

When the device encapsulates the packet, it drops the original VLAN tag.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.1R2.

encapsulation (protocols evpn)

IN THIS SECTION

- Syntax | 6284
- Hierarchy Level | 6284
- Description | 6284
- Options | 6284
- Required Privilege Level | 6286
- Release Information | 6286

Syntax

```
encapsulation (mpls | srv6 | vxlan);
```

Hierarchy Level

```
[edit protocols evpn],
[edit protocols evpn interconnect],
[edit routing-instances routing-instance-name protocols evpn],
[edit routing-instances routing-instance-name protocols evpn interconnect]
```

Description

Configure an encapsulation type for EVPN features.

Options

encapsulation mpls

Use the `encapsulation mpls` statement with the `interconnected-vlan-list` statement as part of the "interconnect" on page 8797 configuration stanza for seamless stitching of EVPN-VXLAN data centers through EVPN-MPLS.

You configure both `vxlan` and `mpls` encapsulations as follows:

- EVPN-VXLAN encapsulation going to the data center (DC) side
- EVPN-MPLS encapsulation on the WAN Data Center Interconnect (DCI) side under the `interconnect` configuration hierarchy.

> **NOTE**: Configure the `encapsulation mpls` statement with the `interconnected-vlan-list` statement for DCI implementations.

This sample configuration defines which VLANs to interconnect from the EVPN-VXLAN domain to the EVPN-MPLS domain.

```
interconnect {
               vrf-target target:2:2;
               route-distinguisher 100:120;
               esi 00:0a:0b:0c:0d:0a:0b:0c:0d:0a; {
                 all-active;
               }
               interconnected-vlan-list [51 52];
               encapsulation mpls;
            }
```

encapsulation srv6

The `encapsulation srv6` statement is used in EVPN-VPWS and EVPN E-LAN services over an SRv6 underlay network.

> **NOTE**: `encapsulation srv6` supports only pure Type 5 routes for EVPN E-LAN over SRv6.

encapsulation vxlan

The `encapsulation vxlan` statement is required for a VXLAN EVPN instance.

> **NOTE**: If you configure the `encapsulation vxlan` statement, then you must also configure the `extended-vni-list` statement.

> **NOTE**: The `encapsulation vxlan` statement is an exclusive command. You cannot configure the `encapsulation vxlan` statement with the `extended-vlan-list` statement, or other commands associated with MPLS EVPN instances.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

The encapsulation vxlan statement was introduced in Junos OS Release 16.1.

The encapsulation mpls statement was added to the interconnect stanza in Junos OS Release 21.4R1.

The encapsulation srv6 statement was introduced in Junos OS Release 22.4R1.

Description

Specify the physical link layer encapsulation type. For some devices, you may also specify the logical link layer encapsulation type. See Feature Explorer for more information.

> **NOTE**: Not all encapsulation types are supported on all switches. See the switch CLI.

Default

`ppp`—Use serial PPP encapsulation.

Physical Interface Options and Logical Interface Options

For physical interfaces:

> **NOTE**: EX Series switches do not support Frame Relay, ATM, PPP, SONET, or SATSOP encapsulation.
>
> ACX Series routers do not support CISCO HDLC encapsulation.

- `atm-ccc-cell-relay`—Use ATM cell-relay encapsulation.
- `atm-pvc`—Defined in RFC 2684, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*. When you configure physical ATM interfaces with ATM PVC encapsulation, an RFC 2684-compliant ATM Adaptation Layer 5 (AAL5) tunnel is set up to route the ATM cells over a Multiprotocol Label Switching (MPLS) path that is typically established between two MPLS-capable routers using the Label Distribution Protocol (LDP).

- `cisco-hdlc`—Use Cisco-compatible High-Level Data Link Control (HDLC) framing. E1, E3, SONET/SDH, T1, and T3 interfaces can use Cisco HDLC encapsulation. Two related versions are supported:
  - CCC version (`cisco-hdlc-ccc`)—The logical interface does not require an encapsulation statement. When you use this encapsulation type, you can configure the `ccc` family only.
  - TCC version (`cisco-hdlc-tcc`)—Similar to CCC and has the same configuration restrictions, but used for circuits with different media on either side of the connection.
- `cisco-hdlc-ccc`—Use Cisco-compatible HDLC framing on CCC circuits.
- `cisco-hdlc-tcc`—Use Cisco-compatible HDLC framing on TCC circuits for connecting different media.
- `ethernet-bridge`—Use Ethernet bridge encapsulation on Ethernet interfaces that have bridging enabled and that must accept all packets.
- `ethernet-over-atm`—For interfaces that carry IPv4 traffic, use Ethernet over ATM encapsulation. When you use this encapsulation type, you cannot configure multipoint interfaces. As defined in RFC 2684, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*, this encapsulation type allows ATM interfaces to connect to devices that support only bridge protocol data units (BPDUs). Junos OS does not completely support bridging, but accepts BPDU packets as a default gateway. If you use the router as an edge device, then the router acts as a default gateway. It accepts Ethernet LLC/SNAP frames with IP or ARP in the payload, and drops the rest. For packets destined to the Ethernet LAN, a route lookup is done using the destination IP address. If the route lookup yields a full address match, the packet is encapsulated with an LLC/SNAP and MAC header, and the packet is forwarded to the ATM interface.
- `ethernet-tcc`—For interfaces that carry IPv4 traffic, use Ethernet TCC encapsulation on interfaces that must accept packets carrying standard TPID values. For 8-port, 12-port, and 48-port Fast Ethernet PICs, TCC is not supported.
- `ethernet-vpls`—Use Ethernet VPLS encapsulation on Ethernet interfaces that have VPLS enabled and that must accept packets carrying standard TPID values. On M Series routers, except the M320 router, the 4-port Fast Ethernet TX PIC and the 1-port, 2-port, and 4-port, 4-slot Gigabit Ethernet PICs can use the Ethernet VPLS encapsulation type.
- `ethernet-vpls-fr`—Use in a VPLS setup when a CE device is connected to a PE device over a time division multiplexing (TDM) link. This encapsulation type enables the PE device to terminate the outer Layer 2 Frame Relay connection, use the *802.1p* bits inside the inner Ethernet header to classify the packets, look at the MAC address from the Ethernet header, and use the MAC address to forward the packet into a given VPLS instance.
- `ethernet-vpls-ppp`—Use in a VPLS setup when a CE device is connected to a PE device over a time division multiplexing (TDM) link. This encapsulation type enables the PE device to terminate the outer Layer 2 PPP connection, use the 802.1p bits inside the inner Ethernet header to classify the

packets, look at the MAC address from the Ethernet header, and use it to forward the packet into a given VPLS instance.

- `ether-vpls-over-atm-llc`—For ATM intelligent queuing (IQ) interfaces only, use the Ethernet virtual private LAN service (VPLS) over ATM LLC encapsulation to bridge Ethernet interfaces and ATM interfaces over a VPLS routing instance (as described in RFC 2684, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*). Packets from the ATM interfaces are converted to standard ENET2/802.3 encapsulated Ethernet frames with the frame check sequence (FCS) field removed.

- `extended-frame-relay-ccc`—Use Frame Relay encapsulation on CCC circuits. This encapsulation type allows you to dedicate DLCIs 1 through 1022 to CCC. When you use this encapsulation type, you can configure the `ccc` family only.

- `extended-frame-relay-ether-type-tcc`—Use extended Frame Relay ether type TCC for Cisco-compatible Frame Relay for DLCIs 1 through 1022. This encapsulation type is used for circuits with different media on either side of the connection.

- `extended-frame-relay-tcc`—Use Frame Relay encapsulation on TCC circuits to connect different media. This encapsulation type allows you to dedicate DLCIs 1 through 1022 to TCC.

- `extended-vlan-bridge`—Use extended VLAN bridge encapsulation on Ethernet interfaces that have IEEE *802.1Q* VLAN tagging and bridging enabled and that must accept packets carrying TPID 0x8100 or a user-defined TPID.

- `extended-vlan-ccc`—Use extended VLAN encapsulation on CCC circuits with Gigabit Ethernet and 4-port Fast Ethernet interfaces that must accept packets carrying 802.1Q values. Extended VLAN CCC encapsulation supports TPIDs 0x8100, 0x9100, and 0x9901. When you use this encapsulation type, you can configure the `ccc` family only. For 8-port, 12-port, and 48-port Fast Ethernet PICs, extended VLAN CCC is not supported. For 4-port Gigabit Ethernet PICs, extended VLAN CCC is not supported.

- `extended-vlan-tcc`—For interfaces that carry IPv4 traffic, use extended VLAN encapsulation on TCC circuits with Gigabit Ethernet interfaces on which you want to use 802.1Q tagging. For 4-port Gigabit Ethernet PICs, extended VLAN TCC is not supported.

- `extended-vlan-vpls`—Use extended VLAN VPLS encapsulation on Ethernet interfaces that have VLAN 802.1Q tagging and VPLS enabled and that must accept packets carrying TPIDs 0x8100, 0x9100, and 0x9901. On M Series routers, except the M320 router, the 4-port Fast Ethernet TX PIC and the 1-port, 2-port, and 4-port, 4-slot Gigabit Ethernet PICs can use the Ethernet VPLS encapsulation type.

> **NOTE**: The built-in Gigabit Ethernet PIC on an M7i router does not support extended VLAN VPLS encapsulation.

- `flexible-ethernet-services`—For Gigabit Ethernet IQ interfaces and Gigabit Ethernet PICs with small form-factor pluggable transceivers (SFPs) (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), and for Gigabit Ethernet interfaces, use flexible Ethernet services encapsulation when you want to configure multiple per-unit Ethernet encapsulations. Aggregated Ethernet bundles can use this encapsulation type. This encapsulation type allows you to configure any combination of route, TCC, CCC, Layer 2 virtual private networks (VPNs), and VPLS encapsulations on a single physical port. If you configure flexible Ethernet services encapsulation on the physical interface, VLAN IDs from 1 through 511 are no longer reserved for normal VLANs.

- `flexible-frame-relay`—For IQ interfaces only, use flexible Frame Relay encapsulation when you want to configure multiple per-unit Frame Relay encapsulations. This encapsulation type allows you to configure any combination of TCC, CCC, and standard Frame Relay encapsulations on a single physical port. Also, each logical interface can have any DLCI value from 1 through 1022.

- `frame-relay`—Use Frame Relay encapsulation is defined in RFC 1490, *Multiprotocol Interconnect over Frame Relay*. E1, E3, link services, SONET/SDH, T1, T3, and voice services interfaces can use Frame Relay encapsulation.

- `frame-relay-ccc`—Use Frame Relay encapsulation on CCC circuits. This encapsulation is same as standard Frame Relay for DLCIs 0 through 511. DLCIs 512 through 1022 are dedicated to CCC. The logical interface must also have `frame-relay-ccc` encapsulation. When you use this encapsulation type, you can configure the `ccc` family only.

- `frame-relay-ether-type`—Use Frame Relay ether type encapsulation for compatibility with the Cisco Frame Relay. IETF frame relay encapsulation identifies the payload format using NLPID and SNAP formats. Cisco-compatible Frame Relay encapsulation uses the Ethernet type to identify the type of payload.

  > **NOTE**: When the encapsulation type is set to Cisco-compatible Frame Relay encapsulation, ensure that the LMI type is set to ANSI or Q933-A.

- `frame-relay-ether-type-tcc`—Use Frame Relay ether type TCC for Cisco-compatible Frame Relay on TCC circuits to connect different media. This encapsulation is Cisco-compatible Frame Relay for DLCIs 0 through 511. DLCIs 512 through 1022 are dedicated to TCC.

- `frame-relay-port-ccc`—Use Frame Relay port CCC encapsulation to transparently carry all the DLCIs between two customer edge (CE) routers without explicitly configuring each DLCI on the two provider edge (PE) routers with Frame Relay transport. The connection between the two CE routers can be either user-to-network interface (UNI) or network-to-network interface (NNI); this is completely transparent to the PE routers. When you use this encapsulation type, you can configure the `ccc` family only.

- `frame-relay-tcc`—This encapsulation is similar to Frame Relay CCC and has the same configuration restrictions, but used for circuits with different media on either side of the connection.
- `generic-services`—Use generic services encapsulation for services with a hierarchical scheduler.
- `multilink-frame-relay-uni-nni`—Use MLFR UNI NNI encapsulation. This encapsulation is used on link services, voice services interfaces functioning as FRF.16 bundles, and their constituent T1 or E1 interfaces, and is supported on LSQ and redundant LSQ interfaces.
- `ppp`—Use serial PPP encapsulation. This encapsulation is defined in RFC 1661, *The Point-to-Point Protocol (PPP) for the Transmission of Multiprotocol Datagrams over Point-to-Point Links*. PPP is the default encapsulation type for physical interfaces. E1, E3, SONET/SDH, T1, and T3 interfaces can use PPP encapsulation.
- `ppp-ccc`—Use serial PPP encapsulation on CCC circuits. When you use this encapsulation type, you can configure the `ccc` family only.
- `ppp-tcc`—Use serial PPP encapsulation on TCC circuits for connecting different media. When you use this encapsulation type, you can configure the `tcc` family only.
- `vlan-ccc`—Use Ethernet VLAN encapsulation on CCC circuits. VLAN CCC encapsulation supports TPID 0x8100 only. When you use this encapsulation type, you can configure the `ccc` family only.
- `vlan-vci-ccc`—Use ATM-to-Ethernet interworking encapsulation on CCC circuits. When you use this encapsulation type, you can configure the `ccc` family only. All logical interfaces configured on the Ethernet interface must also have the encapsulation type set to `vlan-vci-ccc`.
- `vlan-vpls`—Use VLAN VPLS encapsulation on Ethernet interfaces with VLAN tagging and VPLS enabled. Interfaces with VLAN VPLS encapsulation accept packets carrying standard TPID values only. On M Series routers, except the M320 router, the 4-port Fast Ethernet TX PIC and the 1-port, 2-port, and 4-port, 4-slot Gigabit Ethernet PICs can use the Ethernet VPLS encapsulation type.

> **NOTE**:
>
> - Label-switched interfaces (LSIs) do not support VLAN VPLS encapsulation. Therefore, you can only use VLAN VPLS encapsulation on a PE-router-to-CE-router interface and not a core-facing interface.
> - Starting with Junos OS release 13.3, a commit error occurs when you configure `vlan-vpls` encapsulation on a physical interface and configure `family inet` on one of the logical units. Previously, it was possible to commit this invalid configuration.

For logical interfaces:

- `frame-relay`—Configure a Frame Relay encapsulation when the physical interface has multiple logical units, and the units are either point to point or multipoint.
- `multilink-frame-relay-uni-nni`—Link services interfaces functioning as FRF.16 bundles can use Multilink Frame Relay UNI NNI encapsulation.
- `ppp`—For normal mode (when the device is using only one ISDN B-channel per call). Point-to-Point Protocol is for communication between two computers using a serial interface.
- `ppp-over-ether`—This encapsulation is used for underlying interfaces of pp0 interfaces.

Description

Dynamic interface configuration of the logical link-layer encapsulation type.

Options

`atm-ccc-cell-relay`—Use ATM cell-relay encapsulation.

`atm-ccc-vc-mux`—Use ATM virtual circuit (VC) multiplex encapsulation on circuit cross-connect (CCC) circuits. When you use this encapsulation type, you can configure the `ccc` family only.

`atm-cisco-nlpid`—Use Cisco ATM network layer protocol ID (NLPID) encapsulation. When you use this encapsulation type, you can configure the `inet` family only.

`atm-mlppp-llc`—For ATM2 IQ interfaces only, use Multilink Point-to-Point Protocol (MLPPP) over AAL5 LLC. For this encapsulation type, your router must be equipped with a link services or voice services PIC. MLPPP over ATM encapsulation is not supported on ATM2 IQ OC48 interfaces.

`atm-nlpid`—Use ATM NLPID encapsulation. When you use this encapsulation type, you can configure the `inet` family only.

`atm-ppp-llc`—For ATM2 IQ interfaces only, use PPP over AAL5 LLC encapsulation.

`atm-ppp-vc-mux`—For ATM2 IQ interfaces only, use PPP over ATM AAL5 multiplex encapsulation.

`atm-snap`—Use ATM subnetwork attachment point (SNAP) encapsulation.

`atm-tcc-snap`—Use ATM SNAP encapsulation on translational cross-connect (TCC) circuits.

`atm-tcc-vc-mux`—Use ATM VC multiplex encapsulation on TCC circuits. When you use this encapsulation type, you can configure the `tcc` family only.

`atm-vc-mux`—Use ATM VC multiplex encapsulation. When you use this encapsulation type, you can configure the `inet` family only.

`ether-over-atm-llc`—For interfaces that carry IPv4 traffic, use Ethernet over ATM LLC encapsulation. When you use this encapsulation type, you cannot configure multipoint interfaces.

`ether-vpls-over-atm-llc`—For ATM2 IQ interfaces only, use the Ethernet virtual private LAN service (VPLS) over ATM LLC encapsulation to bridge Ethernet interfaces and ATM interfaces over a VPLS routing instance (as described in RFC 2684, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*). Packets from the ATM interfaces are converted to standard ENET2/802.3 encapsulated Ethernet frames with the frame check sequence (FCS) field removed.

`ether-vpls-over-fr`—For E1, T1, E3, T3, and SONET interfaces only, use the Ethernet virtual private LAN service (VPLS) over Frame Relay encapsulation to support Bridged Ethernet over Frame Relay encapsulated TDM interfaces for VPLS applications, as per *Multiprotocol Interconnect over Frame Relay*(RFC 2427 [1490]).

`ether-vpls-over-ppp`—For E1, T1, E3, T3 and SONET interfaces only, use the Ethernet virtual private LAN service (VPLS) over PPP encapsulation to support Bridged Ethernet over PPP encapsulated TDM interfaces for VPLS applications.

`ethernet`—Use Ethernet II encapsulation (as described in RFC 894, *A Standard for the Transmission of IP Datagrams over Ethernet Networks*).

`ethernet-vpls`—Use Ethernet VPLS encapsulation on Ethernet interfaces that have VPLS enabled and that must accept packets carrying standard Tag Protocol ID (TPID) values.

`extended-vlan-vpls`—Use extended virtual LAN (VLAN) VPLS encapsulation on Ethernet interfaces that have VLAN 802.1Q tagging and VPLS enabled and that must accept packets carrying TPIDs 0x8100, 0x9100, and 0x9901.

> **NOTE**: The built-in Gigabit Ethernet PIC on an M7i router does not support extended VLAN VPLS encapsulation.

`frame-relay-ccc`—Use Frame Relay encapsulation on CCC circuits. When you use this encapsulation type, you can configure the `ccc` family only.

`frame-relay-ppp`—Use PPP over Frame Relay circuits. When you use this encapsulation type, you can configure the `ppp` family only.

`frame-relay-tcc`—Use Frame Relay encapsulation on TCC circuits for connecting unlike media. When you use this encapsulation type, you can configure the `tcc` family only.

`frame-relay-ether-type`—Use Frame Relay ether type encapsulation for compatibility with Cisco Frame Relay. The physical interface must be configured with `flexible-frame-relay` encapsulation.

`frame-relay-ether-type-tcc`—Use Frame Relay ether type TCC for Cisco-compatible Frame Relay on TCC circuits to connect unlike media. The physical interface must be configured with `flexible-frame-relay` encapsulation.

`multilink-frame-relay-end-to-end`—Use MLFR FRF.15 encapsulation. This encapsulation is used only on multilink, link services,and voice services interfaces and their constituent T1 or E1 interfaces, and is supported on LSQ and redundant LSQ interfaces.

`multilink-ppp`—Use MLPPP encapsulation. This encapsulation is used only on multilink, link services, and voice services interfaces and their constituent T1 or E1 interfaces.

`ppp-over-ether`—You use PPP over Ethernet encapsulation to configure an underlying Ethernet interface for a dynamic PPPoE logical interface.

`vlan-bridge`—Use Ethernet VLAN bridge encapsulation on Ethernet interfaces that have IEEE 802.1Q tagging, flexible ethernet services, and bridging enabled, and that must accept packets carrying TPID 0x8100 or a user-defined TPID.

`vlan-ccc`—Use Ethernet virtual LAN (VLAN) encapsulation on CCC circuits. When you use this encapsulation type, you can configure the `ccc` family only.

`vlan-vci-ccc`—Use ATM-to-Ethernet interworking encapsulation on CCC circuits. When you use this encapsulation type, you can configure the `ccc` family only.

`vlan-tcc`—Use Ethernet VLAN encapsulation on TCC circuits. When you use this encapsulation type, you can configure the `tcc` family only.

`vlan-vpls`—Use Ethernet VLAN encapsulation on VPLS circuits.

Description

Configure a logical link-layer encapsulation type. Not all encapsulation types are supported on the switches. See the switch CLI.

Starting in Junos OS Release 20.1R1, aggregated ethernet interfaces supports VLAN TCC (Translational cross-connect) encapsulation on MX series platforms. See Configuring VLAN TCC Encapsulation for more details. Non-ethernet media types, SONET and ATM interfaces are only supported. It is expected that the user will have the member links of aggregated ethernet with supported hardware for configuring VLAN TCC encapsulation and no commit check is performed externally for the aggregated ethernet (AE) interfaces.

Options

`atm-ccc-cell-relay`—Use ATM cell-relay encapsulation.

`atm-ccc-vc-mux`—Use ATM virtual circuit (VC) multiplex encapsulation on CCC circuits. When you use this encapsulation type, you can configure the `ccc` family only.

`atm-cisco-nlpid`—Use Cisco ATM network layer protocol identifier (NLPID) encapsulation. When you use this encapsulation type, you can configure the `inet` family only.

`atm-mlppp-llc`—For ATM2 IQ interfaces only, use Multilink Point-to-Point (MLPPP) over AAL5 LLC. For this encapsulation type, your router must be equipped with a Link Services or Voice Services PIC. MLPPP over ATM encapsulation is not supported on ATM2 IQ OC48 interfaces.

`atm-nlpid`—Use ATM NLPID encapsulation. When you use this encapsulation type, you can configure the `inet` family only.

`atm-ppp-llc`—(ATM2 IQ interfaces and MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP only) Use PPP over AAL5 LLC encapsulation.

`atm-ppp-vc-mux`—(ATM2 IQ interfaces and MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP only) Use PPP over ATM AAL5 multiplex encapsulation.

`atm-snap`—(All interfaces including MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP) Use ATM subnetwork attachment point (SNAP) encapsulation.

`atm-tcc-snap`—Use ATM SNAP encapsulation on translational cross-connect (TCC) circuits.

`atm-tcc-vc-mux`—Use ATM VC multiplex encapsulation on TCC circuits. When you use this encapsulation type, you can configure the `tcc` family only.

`atm-vc-mux`—(All interfaces including MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP) Use ATM VC multiplex encapsulation. When you use this encapsulation type, you can configure the `inet` family only.

`ether-over-atm-llc`—(All IP interfaces including MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP) For interfaces that carry IP traffic, use Ethernet over ATM LLC encapsulation. When you use this encapsulation type, you cannot configure multipoint interfaces.

`ether-vpls-over-atm-llc`—For ATM2 IQ interfaces only, use the Ethernet virtual private LAN service (VPLS) over ATM LLC encapsulation to bridge Ethernet interfaces and ATM interfaces over a VPLS routing instance (as described in RFC 2684, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*). Packets from the ATM interfaces are converted to standard ENET2/802.3 encapsulated Ethernet frames with the frame check sequence (FCS) field removed.

`ether-vpls-over-fr`—For E1, T1, E3, T3, and SONET interfaces only, use the Ethernet virtual private LAN service (VPLS) over Frame Relay encapsulation to support Bridged Ethernet over Frame Relay encapsulated TDM interfaces for VPLS applications, per RFC 2427, *Multiprotocol Interconnect over Frame Relay*.

NOTE: The SONET/SDH OC3/STM1 (Multi-Rate) MIC with SFP, the Channelized SONET/SDH OC3/STM1 (Multi-Rate) MIC with SFP, and the DS3/E3 MIC do not support Ethernet over Frame Relay encapsulation.

`ether-vpls-over-ppp`—For E1, T1, E3, T3, and SONET interfaces only, use the Ethernet virtual private LAN service (VPLS) over Point-to-Point Protocol (PPP) encapsulation to support Bridged Ethernet over PPP-encapsulated TDM interfaces for VPLS applications.

`ethernet`—Use Ethernet II encapsulation (as described in RFC 894, *A Standard for the Transmission of IP Datagrams over Ethernet Networks*).

`ethernet-ccc`—Use Ethernet CCC encapsulation on Ethernet interfaces.

`ethernet-vpls`—Use Ethernet VPLS encapsulation on Ethernet interfaces that have VPLS enabled and that must accept packets carrying standard Tag Protocol ID (TPID) values.

> **NOTE**: The built-in Gigabit Ethernet PIC on an M7i router does not support extended VLAN VPLS encapsulation.

`ethernet-vpls-fr`—Use in a VPLS setup when a CE device is connected to a PE router over a time-division multiplexing (TDM) link. This encapsulation type enables the PE router to terminate the outer layer 2 Frame Relay connection, use the *802.1p* bits inside the inner Ethernet header to classify the packets, look at the MAC address from the Ethernet header, and use the MAC address to forward the packet into a given VPLS instance.

`frame-relay-ccc`—Use Frame Relay encapsulation on CCC circuits. When you use this encapsulation type, you can configure the `ccc` family only.

`frame-relay-ether-type`—Use Frame Relay ether type encapsulation for compatibility with Cisco Frame Relay. The physical interface must be configured with flexible-frame-relay encapsulation.

`frame-relay-ether-type-tcc`—Use Frame Relay ether type TCC for Cisco-compatible Frame Relay on TCC circuits to connect different media. The physical interface must be configured with flexible-frame-relay encapsulation.

`frame-relay-ppp`—Use PPP over Frame Relay circuits. When you use this encapsulation type, you can configure the `ppp` family only.

`frame-relay-tcc`—Use Frame Relay encapsulation on TCC circuits for connecting different media. When you use this encapsulation type, you can configure the `tcc` family only.

`gre-fragmentation`—For adaptive services interfaces only, use GRE fragmentation encapsulation to enable fragmentation of IPv4 packets in GRE tunnels. This encapsulation clears the do not fragment (DF) bit in the packet header. If the packet' s size exceeds the tunnel' s maximum transmission unit (MTU) value, the packet is fragmented before encapsulation.

`multilink-frame-relay-end-to-end`—Use MLFR FRF.15 encapsulation. This encapsulation is used only on multilink, link services, and voice services interfaces and their constituent T1 or E1 interfaces, and is supported on LSQ and redundant LSQ interfaces.

`multilink-ppp`—Use MLPPP encapsulation. This encapsulation is used only on multilink, link services, and voice services interfaces and their constituent T1 or E1 interfaces.

`ppp-over-ether`—Use PPP over Ethernet encapsulation to configure an underlying Ethernet interface for a dynamic PPPoE logical interface on M120 and M320 routers with Intelligent Queuing 2 (IQ2) PICs, and on MX Series routers with MPCs.

`ppp-over-ether-over-atm-llc`—(MX Series routers with MPCs using the ATM MIC with SFP only) For underlying ATM interfaces, use PPP over Ethernet over ATM LLC encapsulation. When you use this encapsulation type, you cannot configure the interface address. Instead, configure the interface address on the PPP interface.

`vlan-bridge`—Use Ethernet VLAN bridge encapsulation on Ethernet interfaces that have IEEE *802.1Q* tagging, flexible-ethernet-services, and bridging enabled and that must accept packets carrying TPID 0x8100 or a user-defined TPID.

`vlan-ccc`—Use Ethernet virtual LAN (VLAN) encapsulation on CCC circuits. When you use this encapsulation type, you can configure the `ccc` family only.

`vlan-vci-ccc`—Use ATM-to-Ethernet interworking encapsulation on CCC circuits. When you use this encapsulation type, you can configure the `ccc` family only.

`vlan-tcc`—Use Ethernet VLAN encapsulation on TCC circuits. When you use this encapsulation type, you can configure the `tcc` family only.

`vlan-vpls`—Use Ethernet VLAN encapsulation on VPLS circuits.

`vxlan`—Use VXLAN data plane encapsulation for EVPN.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Change History Table

Feature support is determined by the platform and release you are using. Use Feature Explorer to determine if a feature is supported on your platform.

Release	Description
20.1R1	Starting in Junos OS Release 20.1R1, aggregated ethernet interfaces supports VLAN TCC (Translational cross-connect) encapsulation on MX series platforms.

[edit routing-instances routing-instance-name protocols vpls neighbor address]
```

Description

Specify the type of Layer 2 traffic originating from the CE device. Only the `ethernet` and `ethernet-vlan` encapsulation types are supported for VPLS. Not all encapsulation types are supported on the switches. See the switch CLI.

Options

`atm-aal5`—ATM Adaptation Layer (AAL/5)

`atm-cell`—ATM cell relay

`atm-cell-port-mode`—ATM cell relay port promiscuous mode

`atm-cell-vc-mode`—ATM VC cell relay nonpromiscuous mode

`atm-cell-vp-mode`—ATM virtual path (VP) cell relay promiscuous mode

`cesop`—CESOP-based Layer 2 VPN

`cisco-hdlc`—Cisco Systems–compatible HDLC

encrypt (HTTP Header Enrichment)

IN THIS SECTION

- Syntax | 6320
- Hierarchy Level | 6320
- Description | 6321
- Options | 6321
- Required Privilege Level | 6321
- Release Information | 6321

Syntax

```
encrypt {
    hash algorithm;
    prefix hash-prefix;
}
```

Hierarchy Level

```
[edit services hcm tag-rule rule-name term term-number then tag tag-name]
```

Description

Specify the transform to be applied to the header for the HTTP header enrichment so that you can add subscriber attributes in a way that is obscured from the user.

> **NOTE**: If you include this statement, then you also must configure `hash` and `prefix` statements.

Options

hash ***algorithm*** Use the specified hashing algorithm. Currently, only `md5` is supported.

prefix ***hash-prefix*** Use the specified prefix key (up to 63 alphanumeric characters). The prefix key is concatenated with the specified tag attribute and hashed. The resulting hash value is then inserted into the HTTP header.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.1.

encryption

IN THIS SECTION

- Syntax | 6322
- Hierarchy Level | 6322
- Description | 6322
- Options | 6322
- Required Privilege Level | 6323
- Release Information | 6323

Syntax

```
encryption {
    algorithm algorithm;
    key (ascii-text key | hexadecimal key);
}
```

Hierarchy Level

```
[edit services ipsec-vpn rule rule-name term term-name then manual direction direction]
```

Description

Configure an encryption algorithm and key for manual SA.

Options

`algorithm`—Type of encryption algorithm. The algorithm can be one of the following:

- `des-cbc`—Has a block size of 8 bytes (64 bits); the key size is 48 bits long.
- `3des-cbc`—Has a block size of 8 bytes (64 bits); the key size is 192 bits long.
- `aes-128-cbc`—Advanced Encryption Standard (AES) 128-bit encryption algorithm.

- `aes-192-cbc`—Advanced Encryption Standard (AES) 192-bit encryption algorithm.
- `aes-256-cbc`—Advanced Encryption Standard (AES) 256-bit encryption algorithm.

> **NOTE**: For `3des-cbc`, the first 8 bytes should differ from the second 8 bytes, and the second 8 bytes should be the same as the third 8 bytes.

`key`—Type of encryption key. The key can be one of the following:

- `ascii-text`—ASCII text key. Following are the key lengths, in ASCII characters, for the different encryption options:
  - `des-cbc` option, 8 ASCII characters
  - `3des-cbc` option, 24 ASCII characters
  - `aes-128-cbc` option, 16 ASCII characters
  - `aes-192-cbc` option, 24 ASCII characters
  - `aes-256-cbc` option, 32 ASCII characters
- `hexadecimal`—Hexadecimal key. Following are the key lengths, in hexadecimal characters, for the different encryption options:
  - `des-cbc` option, 16 hexadecimal characters
  - `3des-cbc` option, 48 hexadecimal characters
  - `aes-128-cbc` option, 32 hexadecimal characters
  - `aes-192-cbc` option, 48 hexadecimal characters
  - `aes-256-cbc` option, 64 hexadecimal characters

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

`aes-128-cbc`, `aes-192-cbc`, and `aes-256-cbc` options added in Junos OS Release 7.6.

Configuring IKE Proposals

Configuring IPsec Proposals

encryption-algorithm (Security)

IN THIS SECTION

- Syntax | 6326
- Hierarchy Level | 6326
- Description | 6326
- Options | 6326
- Required Privilege Level | 6327
- Release Information | 6327

Syntax

```
encryption-algorithm (3des-cbc | des-cbc | aes-128-cbc | aes-128-gcm | aes-192-cbc | aes-256-cbc
| aes-256-gcm);
```

Hierarchy Level

```
[edit security ike proposal ike-proposal-name],
[edit security ipsec proposal ipsec-proposal-name]
```

Description

Configure an IKE or IPsec encryption algorithm. Two algorithms are supported: Cipher Block Chaining (CBC) and Galois/Counter Mode (GCM). CBC is older than GCM and is less secure. GCM is considered more secure than CBC since it provides built-in authentication and integrity checks. GCM is also more efficient for parallel processing, which can result in better performance for larger datasets.

Options

- `3des-cbc`—Encryption algorithm with key size of 24 bytes; its key size is 192 bits long.
- `des-cbc`—Encryption algorithm with key size of 8 bytes; its key size is 48 bits long.

- `aes-128-cbc`—Advanced encryption algorithm that has a key size of 16 bytes; its key size is 128 bits long.
- `aes-128-gcm`—AES GCM 128-bit encryption algorithm.
- `aes-192-cbc`—Advanced encryption algorithm that has a key size of 24 bytes; its key size is 192 bits long.
- `aes-256-cbc`—Advanced encryption algorithm that has a key size of 32 bytes; its key size is 256 bits long.
- `aes-256-gcm`—AES GCM 256-bit encryption algorithm. For an IKE proposal, AES 256-bit authenticated encryption algorithm is supported with IKEv2 only. When this option is used, aes-256-gcm should be configured at the [edit security ipsec proposal proposal-name] hierarchy level, and the authentication-algorithm option should not be configured at the [edit security ike proposal proposal-name] hierarchy level.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Configuring an IKE Proposal for Dynamic SAs

Configuring an IPsec Proposal for an ES PIC

encryption-algorithm (Security IKE)

IN THIS SECTION

Syntax | 6328

Hierarchy Level | 6328

- Description | 6328
- Options | 6328
- Required Privilege Level | 6329
- Release Information | 6329

Syntax

```
encryption-algorithm (3des-cbc | aes-128-cbc | aes-128-gcm | aes-192-cbc | aes-256-cbc | aes-256-
gcm | chacha20-poly1305 | des-cbc);
```

Hierarchy Level

```
[edit security ike proposal proposal-name]
```

Description

Configure an encryption algorithm for an IKE proposal. The device does not delete existing IPsec SAs when you update the `encryption-algorithm` configuration in the IKE proposal.

Options

3des-cbc Has a block size of 24 bytes; the key size is 192 bits long.

aes-128-cbc Advanced Encryption Standard (AES) 128-bit encryption algorithm.

aes-128-gcm AES 128-bit authenticated encryption algorithm supported with IKEv2 only. When this option is used, `aes-128-gcm` should be configured at the [`edit security ipsec proposal` *`proposal-name`*] hierarchy level, and the `authentication-algorithm` option should not be configured at the [`edit security ike proposal` *`proposal-name`*] hierarchy level.

When `aes-128-gcm` or `aes-256-gcm` encryption algorithms are configured in the IPsec proposal, it is not mandatory to configure AES-GCM encryption algorithm in the corresponding IKE proposal.

aes-192-cbc AES 192-bit encryption algorithm.

aes-256-cbc AES 256-bit encryption algorithm.

aes-256-gcm AES 256-bit authenticated encryption algorithm supported with IKEv2 only. When this option is used, `aes-256-gcm` should be configured at the [`edit security ipsec proposal` *`proposal-name`*] hierarchy level, and the `authentication-algorithm` option should not be configured at the [`edit security ike proposal` *`proposal-name`*] hierarchy level.

> **NOTE**: Integrity cannot be set with AES-GCM encryption algorithm.

chacha20-poly1305 Chacha20-Poly1305 authenticated encryption algorithm.

On the supported devices, you can use the algorithm with IKEv2 only for control plane security.

Note that you cannot use the algorithm on SRX1500 Firewalls.

des-cbc Has a block size of 8 bytes; the key size is 48 bits long.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5. Support for `aes-128-gcm` and `aes-256-gcm` options added in Junos OS Release 15.1X49-D40.

Starting in Junos OS Release 20.2R1, we've changed the help text description as `NOT RECOMMENDED` for the CLI options `3des-cbc` and `des-cbc` for devices running IKED with `junos-ike` package installed.

Support for the `chacha20-poly1305` option added to SRX1600, SRX2300, SRX4300, SRX4600, SRX5400, SRX5600, SRX5800, and vSRX 3.0 in Junos OS Release 24.2R1.

    key (ascii-text key | hexadecimal key);
}
```

Hierarchy Level

```
[edit security ipsec security-association sa-name manual direction (inbound | outbound |
bidirectional)]
```

Description

Configure an encryption algorithm and key for a manual Security Association.

Options

`algorithm`—Type of encryption algorithm. It can be one of the following:

- `des-cbc`—Has a block size of 8 bytes (64 bits); its key size is 48 bits long.
- `3des-cbc`—Has block size of 8 bytes (64 bits); its key size is 192 bits long.

  NOTE: For `3des-cbc`, we recommend that the first 8 bytes be different from the second 8 bytes, and the second 8 bytes be the same as the third 8 bytes.

- `aes-128-cbc`—Has a block size of 128 bits; its key size is 128 bits long.
- `aes-192-cbc`—Has a block size of 128 bits; its key size is 192 bits long.

- aes-256-cbc—Has a block size of 128 bits; its key size is 256 bits long.

> **NOTE**: The aes-*-cbc algorithms support both IKE and IPsec configurations at the [security] hierarchy level.

key—Type of encryption key. It can be one of the following:

- ascii-text—ASCII text key. For the des-cbc option, the key contains 8 ASCII characters; for 3des-cbc, the key contains 24 ASCII characters.
- hexadecimal—Hexadecimal key. For the des-cbc option, the key contains 16 hexadecimal characters; for the 3des-cbc option, the key contains 48 hexadecimal characters.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

aes-128-cbc, aes-192-cbc, and aes-256-cbc algorithm options added in Junos OS Release 15.1.

- Required Privilege Level | 6336
- Release Information | 6336

Syntax

```
encryption;
```

Hierarchy Level

```
[edit security macsec connectivity-association connectivity-association-name secure-channel secure-channel-name]
```

Description

Enable MACsec encryption within a secure channel.

You can enable MACsec without enabling encryption. If a connectivity association with a secure channel that has not enabled MACsec encryption is associated with an interface, traffic is forwarded across the Ethernet link in clear text. You are, therefore, able to view this unencrypted traffic when you are monitoring the link. The MACsec header is still applied to the frame, however, and all MACsec data integrity checks are run on both ends of the link to ensure the traffic has not been tampered with and does not represent a security threat.

Traffic traversing a MAC-enabled point-to-point Ethernet link traverses the link at the same speed regardless of whether encryption is enabled or disabled. You cannot increase the speed of traffic traversing a MACsec-enabled Ethernet link by disabling encryption.

This command is used to enable encryption when MACsec is configured using secure association key (SAK) security mode only. When MACsec is configuring using static connectivity association key (CAK) security mode, the encryption setting is configured outside of the secure channel using the `no-encryption` configuration statement.

Default

MACsec encryption is disabled when MACsec is configured using static SAK security mode, by default.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

}
attribute device-os-version {
    string string-value;
    }
}
```

Hierarchy Level

```
[edit services user-identification device-information]
```

Description

Specify the name of the device identity profile, also referred to as the `end-user-profile`, and either one or more of its attributes or the name of the Active Directory domain to which the device belongs.

The device identity profile is a key component of the SRX Series Firewall identity feature, which enables you to control access to network resources based on the identity of the user's device, not the identity of the user of the device. The device identity profile includes the domain name and a collection of attributes that characterize the device.

NOTE: You cannot configure the device identity profile without specifying either the domain that the device belongs to at least one of its attributes.

Options

- profile-name *profile-name*—Name of the device identity profile; for example, marketing-west-coast. The profile is specified in the `source-end-user-profile` field of a security policy.
- domain *domain-name*—Name of the domain to which the device belongs; for example, domain1.
- attribute device-identity *string*––Name given to the device, for example, my-device1.
- attribute device-category *string*––Category of the device, for example, laptop.
- attribute device-vendor *string*—Name of the manufacturer of the device, for example, Lenovo.
- attribute device-type *string*––Type of device; for example, ThinkPad.
- attribute device-os *string*-—Operating system running on the device; for example, Windows.
- attribute device-os-version *string*-—Version of the operating system that is running on the device; for example, 10.1.

Syntax

```
engine-id {
    (local engine-id-suffix | use-default-ip-address | use-mac-address);
}
```

Hierarchy Level

```
[edit snmp]
```

Description

Define a unique identifier for an SNMPv3 engine by configuring the suffix of the engine ID. The engine ID is used for identification only and not for addressing. There are two parts of an engine ID: the prefix

and the suffix. The prefix is formatted according to the specifications defined in RFC 3411, *An Architecture for Describing Simple Network Management Protocol (SNMP) Management Frameworks* and cannot be configured. The suffix is configured here.

> **NOTE**: SNMPv3 authentication and encryption keys are generated based on the associated user passwords and the engine ID. If you configure or change the engine ID, you must commit the user passwords and new engine ID before you configure SNMPv3 users, or the authentication will fail.
>
> For the engine ID, we recommend using the MAC address of the management port.
>
> By default the `use-mac-address` option is enabled. This causes the engine ID suffix to be based on a MAC address.
>
> Starting with Junos OS release 14.1X53-D43, QFX Series switches use the chassis MAC address for the engine ID suffix. On OCX Series, the MAC address of the management interface continues to be used.
>
> You can override the default behavior by using the `local` *`engine-id-suffix`* option, or by using the `use-default-ip-address` option.

Default

For QFX series, when no `snmp engine-id` is configured, the default value for the configuration is `use-mac-address`.

For ACX, EX, and MX series, when no `snmp engine-id` is configured, the default value for the configuration is `use-default-ip-address`.

> **NOTE**: For ZTP, if you need `snmp engine-id` to be constant, you must set the `engine-id` configuration to `set snmp engine-id local` *`engine-id-suffix`*.

Options

`local` ***`engine-id-suffix`***	The engine ID suffix is set based on the data entered.
`use-default-ip-address`	The engine ID suffix is generated from the default IP address.
`use-mac-address`	The engine ID suffix is generated from the MAC address of the management interface on all the junos platforms.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Syntax

```
enhanced-convergence;
```

Hierarchy Level

```
[edit interfaces aeX aggregated-ether-options mc-ae]
[edit interfaces irb unit unit-number]
```

Description

NOTE: On EX9200 and QFX10000 switches, enhanced convergence is applicable for unicast traffic only—for example, when a MAC address is learned over an MC-AE interface, or an ARP entry is resolved over an MC-AE interface.

> **NOTE**: Enhanced convergence is not supported on QFX5100, QFX5110, QFX5120, QFX5200-48Y, QFX5200-32C, and QFX5210-64C switches.

Improves Layer 2 and Layer 3 convergence time when a multichassis aggregated Ethernet (MC-AE) link goes down or comes up in a bridge domain or VLAN. Convergence time is improved because the traffic on the MC-AE interface is switched to the interchassis link (ICL) without waiting for a MAC address update.

If you have configured an IRB interface over an MC-AE interface that has enhanced convergences enabled, then you must configure enhanced convergence on the IRB interface as well. Enhanced convergence must be enabled for both Layer 2 and Layer 3 interfaces.

- Description | 6359
- Options | 6359
- Required Privilege Level | 6361
- Release Information | 6361

Syntax

```
enhanced {
    overhead-bytes overhead-value  (0-255 bytes);
    traffic-type (ucast | mcast);
    family (ipv4 | ipv6 | both );
    direction (ingress | egress | both);
}
```

Hierarchy Level

```
[edit interfaces interface-name forwarding-class-accounting],
[edit interfaces interface-name unit logical-unit-number forwarding-class-accounting]
```

Description

Specify the traffic and type for which you want to apply counters. A single aggregate counter per forwarding class can be used for inet and inet6 flows. Forwarding class accounting applies to transit traffic only, not host-generated or host-bound traffic. For ingress, only packets forwarded to the fabric are counted. For egress, only packets forwarded to the WAN are counted. Non-relevant network protocols such as ARP, BFD, and EOAM, as well as dropped packets, are not counted.

NOTE: Forwarding class accounting (enhanced mode) is not supported in "hyper-mode (forwarding-options)" on page 8221.

Options

overhead-bytes *overhead-value*

The number of overhead-bytes to be accounted.

- **Range:** 0 through 255 bytes
- **Default:** If zero, or no value is specified, the number of overhead-bytes will be determined by the encapsulation configured on the interface. For Ethernet, the default values are as follows:

Untagged DIX, includes CRC	18

Single-tagged DIX, includes CRC	22
Double-tagged DIX, includes CRC	26
VLAN-bridge (CRC)	4
VLAN-CCC (CRC)	4
Untagged VLAN-TCC, includes CRC	18
Single-tagged VLAN-TCC, includes CRC	22
Double-tagged VLAN-TCC, includes CRC	26
VLAN-VPLS (CRC)	4

Packet over SONET (POS) interfaces on an MPC are dependent on the frame check sequence (FCS) settings on the interface, which may be two or four bytes. The default values for POS interfaces are as follows:

PPP (Layer 2 overhead plus FCS)	4+ (2 or 4)
Cisco-HDLC (Layer 2 overhead plus FCS)	4+ (2 or 4)
Frame-relay (Layer 2 overhead plus FCS)	4+ (2 or 4)
Cisco-HDLC-CCC (FCS)	2 or 4
Cisco-HDLC-TCC (FCS)	2 or 4
PPP-CCC (FCS)	2 or 4
PPP-TCC (FCS)	2 or 4

Frame-relay-CCC (FCS)	2 or 4
Frame-relay-TCC (FCS)	2 or 4

traffic-type *(ucast | mcast)*

Traffic to be counted can be unicast only or multicast only.

- **Default:** not enabled, i.e., both unicast and multicast are counted

family *(ipv4 | ipv6 | both)*

Traffic to be counted can be IPv4, IPv6, or both.

- **Default:** both

direction *(ingress | egress | both)*

Traffic can be inbound to the interface, outbound, or both.

- **Default:** both

Required Privilege Level

interface—To view this statement in the configuration.

Hierarchy Level

```
[edit forwarding-options],
[edit logical-systems logical-system-name routing-instances instance-name forwarding-options],
[edit routing-instances instance-name forwarding-options]
```

Junos OS Evolved uses the `set` command instead of `edit`.

Description

Configure the hashing key used to hash link aggregation group (LAG) and equal-cost multipath (ECMP) traffic, or enable adaptive load balancing (ALB) in a Virtual Chassis Fabric (VCF).

> **NOTE**: Starting in Junos OS Release 14.1X53-D46, 15.1R7, 16.1R6, 17.1R3, 17.2R2, 17.3R2, and 17.4R1, the ALB feature is deprecated. If `fabric-load-balance` is enabled in the configuration for a VCF, delete the configuration item upon upgrading Junos OS.

The hashing algorithm is used to make traffic-forwarding decisions for traffic entering a LAG bundle or for traffic exiting a switch when ECMP is enabled.

For LAG bundles, the hashing algorithm determines how traffic entering a LAG bundle is placed onto the bundle's member links. The hashing algorithm tries to manage bandwidth by evenly load-balancing all incoming traffic across the member links in the bundle.

When ECMP is enabled, the hashing algorithm determines how incoming traffic is forwarded to the next-hop device.

The computed hash is not only used in selecting an ECMP path, but also is used for load balancing. Starting in Junos OS Release 18.3R1, the `flow-label field` is included by default in the hash computation for IPv6, GRE, and PPPoE packets. This can be beneficial, for example, when you have MX routers operating as designated router (DR) or rendezvous point (RP) and want to load balance traffic on the basis of a single Layer 3 or Layer 4 flow. You can revert to the previous method of hash computation by setting the `no-flow-label` option.

- For GRE packets, if the outer IP packet is non-option packet and the inner packet is IPv4 or IPv6, then the source and destination IP addresses from inner packet will be included in hash computation.

  The Layer 4 ports will also be included in hash computation if the protocol of the inner IP packet is TCP or UDP, and if the inner IP packet is not an options packet.

  If outer IP packet is a non-options packet, and the inner packet is MPLS, then the top inner label is included in hash computation.

- For PPPoE packet, if the inner packet is IPv4 or IPv6, then source and destination IP addresses from inner packet will be included in hash computation.

  The Layer 4 ports are included in the hash computation if the protocol of inner IP packet is TCP or UDP, and the inner IP packet is a non-options packet.

For MX Series routers with MPCs, T4000 routers with Type 5 FPCs, EX9200 switches, and PTX10008 routers, select data used in the hash key for enhanced IP forwarding engines.

By default, MPCs use the following parameters for hashing:

- Source IP address
- Destination IP address
- Layer 3 protocol
- Source port
- Destination port
- Generic routing encapsulation (GRE) for GRE packets only.

You can modify the default hashing mechanism on MPCs and Type 5 FPCs by configuring statements at the `[edit forwarding-options enhanced-hash-key]` hierarchy level.

QFX10000 Series switches

- On QFX10000 Series switches, you can configure the hash seed for load balancing. By default, the QFX10000 Series switches use the system MAC address to generate a hash seed value. You can configure the hash seed value using the **hash-seed** statement at the `[edit forwarding-options enhanced-hash-key]` hierarchy level. Set a value between 0 and 4294967295. If you do not configure a hash seed value, the system generates a hash seed value based on the system MAC address.
- Starting in Junos OS Release 18.4R1, symmetric hashing is supported on the QFX10000 Series switches. You configure the `no-incoming-port` option under the [edit forwarding-options enhanced-hash-key] hierarchy. By default, Destination IP (DIP), SIP, Layer 4 source and destination ports, and the incoming port are used for hashing. You can only configure symmetric hashing at the global level.

QFX5000 Series switches

> **NOTE**: On QFX5000 Series switches, multicast packets gets duplicated or dropped when `vlan-id` is included in the `enhanced-hash-key` configuration. Hence, while configuring `enhanced-hash-key`, you must configure `layer2-payload` and `layer2-header` options without configuring `vlan-id`. This behavior is only seen in multicast traffic.

- Starting in Junos OS Release 19.4R1, the dynamic load balancing on ECMP is supported on QFX5120-32C and QFX5120-48Y switches. You can configure the `ecmp-dlb` option under the [edit forwarding-options enhanced-hash-key] hierarchy. Refer *Dynamic Load Balancing* for more details.
- To enable symmetric hashing on the QFX5000 line of switches, configure the `symmetric-hash` option.

Enhanced hash key is supported on SRX5000 routers by implementing control path for for the configured setting to reach the services processing card (SPC2) and SPC3. You configure the `session-id` option to enable the control path for the configured setting to reach the service processing unit (SPU).

For more details, see CLI Explorer.

Default

In PTX, compared to MX (which is similar to QFX), the source and destination mac address options for hash computation are different. While QFX excludes the default MAC address fields for hash computations, PTX includes the destination MAC while excluding the source-mac.

Options

`services-loadbalancing`—Distributes traffic across PICs based on source IP address when a route pointing to more than one services PICs is installed.

`symmetric`—Enable symmetric load balancing across aggregated Ethernet interfaces. This option is needed on Trio-based MPCs only.

Data selections for `services-loadbalancing`:

- `inet`—IPv4 addressing protocol.
- `inet6`—IPv6 addressing protocol.
- `layer-3-services`—Include layer 3 IP data in the hash key.
- `incoming-interface-index`—Include incoming interface index in the hash key.
- `source-address`—Include source-address in the hash key.
- `destination-address`—Include destination-address in the hash key.
- `src-prefix-len`—Include the source prefix length in the hash key.

Data selections for family `any`:

- `incoming-interface-index`—(PTX10008 only) Include incoming interface index in the hash key.
- `no-tunnel-payload`—(PTX10001-36MR, PTX10004, PTX10008, and PTX10016 only) Omit the tunnel payload data from the hash key.

Data selections for family `inet`:

- **gtp-tunnel-endpoint-identifer**—Include the tunnel endpoint identifier (TEID) field in the hash key for GPRS tunneling protocol (GTP) traffic.

  > **NOTE**: This option is supported only on MX Series routers with MPCs and on the MX80 router.

- `incoming-interface-index`—Include incoming interface index in the hash key.

- `no-destination-port`—Omit IP destination port in the hash key.
- `no-source-port`—Omit IP source port in the hash key.
- `type-of-service`—Include type-of-service (TOS) byte in the hash key.

Data selections for family `inet6`:

- **gtp-tunnel-endpoint-identifer**—Include the tunnel endpoint identifier (TEID) field in the hash key for GPRS tunneling protocol (GTP) traffic.

  > **NOTE**: This option is supported only on MX Series routers with MPCs and on the MX80 router.

- `incoming-interface-index`—Include the incoming interface index in the hash key.
- `no-destination-port`—Omit the IP destination port in the hash key.
- `no-source-port`—Omit the IP source port in the hash key.
- `traffic-class`—Include the traffic class byte in the hash key.

Data selections for family `mpls`:

- `ether-pseudowire`—Load-balance IP over Ethernet pseudowire. Presence of zero-control-word in the payload indicates an Ethernet frame.
- `incoming-interface-index`—Include the incoming interface index in the hash key.
- `label-1-exp`—The EXP bit of the first label is used in the hash calculation.
- `no-ether-pseudowire`—Omit the Ethernet pseudowire payload data from the hash key (MX Series routers with MPCs only).
- `no-labels`—Omit MPLS labels from the hash key (PTX10008 only).
- `no-payload`—Omit the MPLS payload data from the hash key.

Data selections for family `multiservice`:

- `incoming-interface-index`—Include the incoming interface index in the hash key.
- `no-mac-addresses`—Omit source and destination MAC addresses from the hash key.
- `no-payload`—Omit the payload data from the hash key.
- `outer-priority`—Include the outer 802.1 priority bits in the hash key.

- `source-mac`—Includes source MAC address in hash key
- `no-destination-mac`—Excludes destination MAC address in hash key.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.1.

`services-loadbalancing` statement introduced in Junos OS Release 11.2.

`gtp-tunnel-endpoint-identifier` statement introduced in Junos OS Release 13.2

The `fabric-load-balance` statement introduced in Junos OS Release 14.1X53-D10.

The `fabric-load-balance` statement deprecated starting in Junos OS Releases 14.1X53-D46, 15.1R7, 16.1R6, 17.1R3, 17.2R2, 17.3R2, and 17.4R1.

The `hash-seed` statement introduced in Junos OS Release 15.1X53-D30.

`ether-pseudowire` statement introduced in Junos OS Release 16.1 for the M Series, MX Series, and PTX Series.

`l2tp-tunnel-session-identifier` statement introduced in Junos OS Release 17.2

Starting in Junos OS Release 18.3R1, the default behavior for IPv6, GRE, and PPPoE packet hash computation is to include the flow-label field for improved load-balancing in certain cases. Use the `no-payload` option to revert to the previous method for hash computation.

The `ecmp-dlb` statement introduced in Junos OS Release 19.4R1 for QFX5120-32C and QFX5120-48Y switches.

Option `symmetric-hash` introduced in Junos OS Release 20.4R1.

Statement introduced in Junos OS Evolved Release 21.3R1.

The `ecmp-dlb` statement is introduced in Junos OS Release 23.2R1 for EX4400-24T, EX4400-24X, and EX-4400-48F switches.

}
```

Hierarchy Level

```
[edit forwarding-options]
```

Junos OS Evolved uses the `set` command instead of `edit`.

Description

Configure the hashing key used to hash link aggregation group (LAG) and equal-cost multipath (ECMP) traffic, or enable adaptive load balancing (ALB) in a Virtual Chassis Fabric (VCF).

NOTE: Starting in Junos OS Release 14.1X53-D46, 15.1R7, 16.1R6, 17.1R3, 17.2R2, 17.3R2, and 17.4R1, the ALB feature is deprecated. If `fabric-load-balance` is enabled in the configuration for a VCF, delete the configuration item upon upgrading Junos OS.

The hashing algorithm is used to make traffic-forwarding decisions for traffic entering a LAG bundle or for traffic exiting a switch when ECMP is enabled.

For LAG bundles, the hashing algorithm determines how traffic entering a LAG bundle is placed onto the bundle's member links. The hashing algorithm tries to manage bandwidth by evenly load-balancing all incoming traffic across the member links in the bundle.

When ECMP is enabled, the hashing algorithm determines how incoming traffic is forwarded to the next-hop device.

QFX10000 Series switches

- On QFX10000 Series switches, you can configure the hash seed for load balancing. By default, the QFX10000 Series switches use the system MAC address to generate a hash seed value. You can configure the hash seed value using the **hash-seed** statement at the [`edit forwarding-options enhanced-hash-key`] hierarchy level. Set a value between 0 and 4294967295. If you do not configure a hash seed value, the system generates a hash seed value based on the system MAC address.

- Starting in Junos OS Release 18.4R1, symmetric hashing is supported on the QFX10000 Series switches. You configure the `no-incoming-port` option under the [edit forwarding-options enhanced-hash-key] hierarchy. By default, Destination IP (DIP), SIP, Layer 4 source and destination ports, and the incoming port are used for hashing. You can only configure symmetric hashing at the global level.

QFX5000 Series switches

> **NOTE**: On QFX5000 Series switches, multicast packets gets duplicated or dropped when `vlan-id` is included in the `enhanced-hash-key` configuration. Hence, while configuring `enhanced-hash-key`, you must configure `layer2-payload` and `layer2-header` options without configuring `vlan-id`. This behavior is only seen in multicast traffic.

- Starting in Junos OS Release 19.4R1, the dynamic load balancing on ECMP is supported on QFX5120-32C and QFX5120-48Y switches. You can configure the `ecmp-dlb` option under the [edit forwarding-options enhanced-hash-key] hierarchy. Refer *Dynamic Load Balancing* for more details.

- To enable symmetric hashing on the QFX5000 line of switches, configure the `symmetric-hash` option.

Enhanced hash key is supported on SRX5000 routers by implementing control path for for the configured setting to reach the services processing card (SPC2) and SPC3. You configure the `session-id` option to enable the control path for the configured setting to reach the service processing unit (SPU).

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2X51-D15.

The `fabric-load-balance` statement introduced in Junos OS Release 14.1X53-D10.

The `fabric-load-balance` statement deprecated starting in Junos OS Releases 14.1X53-D46, 15.1R7, 16.1R6, 17.1R3, 17.2R2, 17.3R2, and 17.4R1.

The `hash-seed` statement introduced in Junos OS Release 15.1X53-D30.

The `ecmp-dlb` statement introduced in Junos OS Release 19.4R1 for QFX5120-32C and QFX5120-48Y switches.

Option `symmetric-hash` introduced in Junos OS Release 20.4R1.

Statement introduced in Junos OS Evolved Release 21.3R1.

The `ecmp-dlb` statement is introduced in Junos OS Release 23.2R1 for EX4400-24T, EX4400-24X, and EX-4400-48F switches.

Hierarchy Level

```
[edit forwarding-options]
```

Description

Enable or disable profile fields for an enhanced-hash-key load balancing profile (profile1 or profile2).

On EVO platforms, users can disable or enable enhanced-hash-key fields for load balancing by configuring "set forwarding-options enhanced-hash-key". However, this enhanced-hash-key config change is chassis-wide, and will be applied to any route. Committing a change on any particular enhanced-hash-key field will affect load balance of all applicable traffic.

Therefore, users can configure two load balance profiles (profile1 and profile2) with different sets of enhanced-hash-key configurations. Users will be able to apply a load balance profile to a specific route, not affecting other routes on the chassis, adding flexibility for load balance management.

The following are the profile fields that can be used for enhanced-hash-key profile1 and profile2:

Table 34: profile fields

Settings	enhanced-hash-key profile field	Description
Interface	no-in-interface	Inner inteface fields
	no-interface	Interface fields

Table 34: profile fields *(Continued)*

Settings	enhanced-hash-key profile field	Description
Flexbytes	no-in-flexbytes	Inner L3/L4 flexbytes fields
	no-flexbytes	L3/L4 flexbytes fields
Tunnel	no-tunnel	Tunnel header fields
	no-in-tunnel	Inner tunnel header fields
Traffic Class	no-in-layer3-pri	Inner L3 dscp/dp fields
	no-layer3-pri	L3 dscp/dp fields
Layer 2	no-in-layer2	Inner layer2 fields
	no-layer2	DMAC, SMAC and VLAN fields
Layer 3	no-in-layer3-proto	Inner L3 protocol fields
	no-layer3-proto	L3 protocol fields
	no-layer3-source-address	L3 source address fields
	no-layer3-destination-address	L3 destination address fields
	no-in-layer3	Inner layer3 fields
Layer 4	no-layer4-source-port	L4 source port fields
	no-layer4-destination-port	L4 destination port fields
	no-in-layer4	Inner layer4 fields

Profile fields are enabled by default and are only disabled if explicitly set. As an example, if load-balancing profile `profile1` has been set for a route, interface fields are enabled by default in profile1, unless explicitly disabled with the `set forwarding-options enhnaced-hash-key profile1 no-interface` configuration command.

Default

Default profile - The default profile or global profile is applied internally when neither profile1 or profile2 is applied to a route. You cannot use "default" as a profile name.

The final hash result is determined from an AND operation between hash fields of default profile and hash fields of profile1/profile2.

Table 35: Final hash results from default profile and profile1/profile2 AND operation

Default profile hash field enabled/ disabled (1/0)	profile1/profile2 hash field enabled/disabled (1/0)	Final hash result
1	1	1
1	0	0
0	1	0
0	0	0

As an example, `no-destination-port` and `no-source-port` enhanced-hash-key fields (disabled by default) are part of the default profile. Their equivalent profile fields in profile1/profile2 are `no-layer4-source-port` and `no-layer4-destination-port` (enabled by default). To enable `no-destination-port` and `no-source-port` enhanced-hash-key fields of the default profile, the following global CLI can be used:

```
set forwarding-options enhanced-hash-key family inet no-destination-port;
set forwarding-options enhanced-hash-key family inet no-source-port;
```

The following table shows the final hash computation when `no-destination-port` and `no-source-port` is enabled globally. Note that you can use `show forwarding-options enhanced-hash-key` *`profile1/profile2`* to view the final hash computation results.

Table 36: no-destination-port and no-source-port Final Hash

Default profile no-destination-port and no-source-port enhanced-hash-key fields enabled/disabled (1/0)	profile1/profile2 no-layer4-source-port and no-layer4-destination-port profile fields enabled/disabled (1/0)	Final hash result
1	1	1

To disable `no-destination-port` and `no-source-port` hashing only for a specific route while enabling `no-destination-port` and `no-source-port` hashing on all other routes, user can configure a profile for the route as follows.

```
set forwarding-options enhanced-hash-key profile1 no-layer4-source-port
set forwarding-options enhanced-hash-key profile1 no-layer4-destination-port
set policy-options policy-statement lb term 1 from route-filter 10.0.0.0/16 orlonger
set policy-options policy-statement lb term 1 then load-balance profile1
set policy-options policy-statement lb term 1 then accept
set policy-options policy-statement lb then accept
set routing-options forwarding-table export lb
```

The final hash result for `no-destination-port` and `no-source-port` hashing for route 10.0.0.0/16 would be "0" or disabled as indicated in the following table. `no-destination-port` and `no-source-port` hashing is still enabled for all other routes on the chassis.

Table 37: no-destination-port and no-source-port Final Hash for Specific Route

Default profile no-destination-port and no-source-port enhanced-hash-key fields enabled/disabled (1/0)	profile1 no-layer4-source-port and no-layer4-destination-port profile fields enabled/disabled (1/0)	Final hash result
1	0	0

```

Hierarchy Level

```
[edit firewall]
```

Description

Configure up to four policers in an enhanced hierarchical policer configuration to police traffic from four traffic priority levels, namely, high, medium-high, medium-low, and low.

Options

Each of the four policers must be configured with only one option from the following list.

- high – The policer is assigned to rate-limit traffic from the 'high' traffic priority.
- medium-high - The policer is assigned to rate-limit traffic from the 'medium-high' traffic priority.
- medium-low - The policer is assigned to rate-limit traffic from the 'medium-low' traffic priority.
- low - The policer is assigned to rate-limit traffic from the 'low' traffic priority.

After which, each option needs to be further configured with commited-burst-size, committed-information-rate and max-committed-information-rate. For example, the following is a sample configuration of how medium-low can be configured.

```
set firewall enhanced-hierarchical-policer hpol medium-high committed-information-rate 10m
set firewall enhanced-hierarchical-policer hpol medium-high committed-burst-size 15k
set firewall enhanced-hierarchical-policer hpol medium-high max-committed-information-rate 15m
set firewall enhanced-hierarchical-policer hpol medium-high then discard
```

```

Description

Limit static service filters or API-client filters to term-based filter format only for inet or inet6 families when enhanced network services mode is configured at the `[edit chassis network-services]` hierarchy level. You cannot attach enhanced mode filters to local loopback, management, or MS-DPC interfaces. These interfaces are processed by the Routing Engine and DPC modules and can accept only compiled firewall filter format. In cases where both filter formats are needed for dynamic service filters, you can use the "enhanced-mode-override" on page 6401 statement on the specific filter definition to override the default filter term-based only format of chassis network-service enhanced IP mode.The `enhanced-mode` and the `enhanced-mode-override` statements are mutually exclusive; you can define the filter with either `enhanced-mode` or `enhanced-mode-override`, but not both.

> **NOTE**:
> For MX Series routers with MPCs, you need to initialize Trio-only match filters (that is, a filter that includes at least one match condition or action that is only supported by the Trio chipset) by walking the corresponding SNMP MIB. For example, for any filter that is configured or changed with respect to their Trio only filters, you need to run a command such as the following: `show snmp mib walk (ascii | decimal) object-id`. This forces Junos to learn the filter counters and ensure that the filter statistics are displayed. This guidance applies to all `enhanced-mode` firewall filters. It also applies to Firewall Filter Match Conditions for IPv4 Traffic with flexible match filter terms for offset-range or offset-mask, `gre-key`, and Firewall Filter Match Conditions for IPv6 Traffic with any of the following match conditions: `payload-protocol`, `extension headers`, `is_fragment`. It also applies to filters with either of the following Firewall Filter Terminating Actions: `encapsulate` or `decapsulate`, or either of the following Firewall Filter Nonterminating Actions: `policy-map`, and `clear-policy-map`.

When used with one of the chassis enhanced network services modes, firewall filters are generated in term-based format for use with MPC modules. Do not use enhanced mode for firewall filters that are intended for control plane traffic. Control plane filtering is handled by the Routing Engine kernel, which cannot use the term-based format of the enhanced mode filters.

If enhanced network services are not configured for the chassis, the `enhanced-mode` statement is ignored and any enhanced mode firewall filters are generated in both term-based and the default, compiled format. Only term-based (enhanced) firewall filters will be generated, regardless of the setting of the `enhanced-mode` statement at the [`edit chassis network-services`] hierarchy level, if any of the following are true:

- Flexible filter match conditions are configured at the [`edit firewall family` *`family-name`* `filter` *`filter-name`* `term` *`term-name`* `from`] or [`edit firewall filter` *`filter-name`* `term` *`term-name`* `from`] hierarchy levels.
- A tunnel header push or pop action, such as GRE encapsulate or decapsulate is configured at the [`edit firewall family` *`family-name`* `filter` *`filter-name`* `term` *`term-name`* `then`] hierarchy level.
- Payload-protocol match conditions are configured at the [`edit firewall family` *`family-name`* `filter` *`filter-name`* `term` *`term-name`* `from`] or [`edit firewall filter` *`filter-name`* `term` *`term-name`* `from`] hierarchy levels.
- An extension-header match is configured at the [`edit firewall family` *`family-name`* `filter` *`filter-name`* `term` *`term-name`* `from`] or [`edit firewall filter` *`filter-name`* `term` *`term-name`* `from`] hierarchy levels.
- A match condition is configured that only works with MPC cards, such as firewall bridge filters for IPv6 traffic.

For packets sourced from the Routing Engine, the Routing Engine processes Layer 3 packets by applying output filters to the packets and forwards Layer 2 packets to the Packet Forwarding Engine for

transmission. By configuring the enhanced mode filter, you explicitly specify that only the term-based filter format is used, which also implies that the Routing Engine cannot use this filter.

[edit chassis network-services]
```

Description

PTX1000, PTX3000 and PTX5000 Routers—When you configure `enhanced-mode` on PTX series routers, the following features are enabled on the router:

- Filter-based generic routing encapsulation (GRE) for IPV4 and IPV6 tunneling.
- `promote gre-key` statement for configuring gre-key as one of the matches in a filter.
- `promote dscp` under `family inet`, and `promote traffic-class` under `family inet6` statements for configuring these as one of the matches in a filter. (Added in Junos OS 17.1 for all PTX Series routers with third-generation FPCs.)
- `gtp-tunnel-endpoint-identifier` statement for including hash calculation for IPv4 or IPv6 packets in the GPRS tunneling protocol–Tunnel end point ID (GTP-TEID) field hash calculations.
- Wider configuration range for Bidirectional Forwarding Detection (BFD) protocol intervals.
- Support for up to two million routes per chassis.
- Support for Layer 3 VPN. The `vrf-table-label` statement is supported. (Added in Junos OS 15.1F5 for PTX5000 routers.)
- Support for destination class usage (DCU) and source class usage (SCU) accounting. (Added in Junos OS 15.1F5 for PTX5000 routers.)

NOTE:

- When you configure the `enhanced-mode` statement, only third-generation FPCs are allowed to be powered on. All other FPCs are powered off and cannot be brought online.
- When you do not configure the `enhanced-mode` statement, third-generation FPCs do not support the advanced features in the preceding list. Third-generation FPC only provide the same functionality as the first-generation and second-generation FPCs.
- After you configure the `enhanced-mode` statement and commit the configuration, the router must reboot.

T4000 Routers—When you configure `enhanced-mode` on T4000 routers, improved virtual private LAN service (VPLS) MAC address learning by supporting up to 262,143 MAC addresses per VPLS routing instance is enabled.

NOTE:

- The `enhanced-mode` statement supports up to 262,143 MAC addresses per VPLS routing instance. However, the MAC address learning limit for each interface remains the same (that is, 65,535 MAC addresses).
- After you configure the `enhanced-mode` statement and committing the configuration, you receive a warning message that prompts you to reboot the router. You must reboot the router and then modify the size of the VPLS MAC address table; otherwise, the improved VPLS MAC address learning does not take effect.
- When the T4000 router reboots after the `enhanced-mode` statement is configured, only the T4000 Type 5 FPCs are online while the remaining FPCs are offline.

Default

PTX Series Routers, except the PTX10000 line of routers—By default, the `enhanced-mode` statement is disabled.

PTX 10000 line of routers (such as PTX10001, PTX10003, PTX10008, and PTX10016 routers)—By default, the `enhanced-mode` statement is enabled.

T4000 Routers—By default, the improved VPLS MAC address learning feature is disabled.

[edit firewall family family-name filter filter-name],
[edit logical-systems logical-system-name firewall filter filter-name],
[edit logical-systems logical-system-name firewall family family-name filter filter-name]
```

Description

Overrides the default filter enhanced-mode of dynamic service filters when the chassis is running in network-services enhanced IP mode. It functions similarly to the "enhanced-mode" on page 6396 statement used to override the default IP mode of static filters when the chassis is running in network-services enhanced IP mode.

When the chassis is running in network-service enhanced IP mode, all dynamic service inet and inet6 firewall filters are automatically generated in term-based filter format only. For any dynamic service filter that must be generated in both term-based and compiled formats, you must specifically configure the `enhanced-mode-override` statement for that filter definition.

Similar to how the filter `enhanced-mode` statement functions, if the chassis is not running in network-services enhanced IP mode, then the `enhanced-mode-override` statement is ignored.

> **NOTE**: The `enhanced-mode` and the `enhanced-mode-override` statements are mutually exclusive; you can define the filter with either `enhanced-mode` or `enhanced-mode-override`, but not both.

enhanced-policer

IN THIS SECTION

- Syntax | 6403
- Hierarchy Level | 6403
- Description | 6403
- Required Privilege Level | 6404
- Release Information | 6404

Syntax

```
enhanced-policer
```

Hierarchy Level

```
[edit chassis]
```

Description

Collect additional statistics to be displayed using `show` commands. An FPC restart is required after changing this configuration.

A warning log message is generated when you commit a configuration that contains the `enhanced-policer` statement. The log message states that the enhanced policer is enabled on FPCs only after they are restarted. If you do not reboot the FPCs, the FPCs return all 0s (zeros) when you perform a query for the retrieval of detailed statistics—for example, when you issue the `show firewall detail` command.

BEST PRACTICE: We recommend that you do not use enhanced policers in highly scaled environments. Enhanced policer statistics require significantly more memory for statistics counters than do simple policers. The memory requirements for enhanced policers might exceed your resource memory limit, depending on the number of subscribers in your configuration and on the number of policers configured for the subscribers.

Required Privilege Level

interface—To view this statement in the configuration.

```

Description

Insert the entropy label into the BGP labeled unicast LSP packets, which assists the transit router in load-balancing BGP traffic across equal-cost multipaths or link aggregation groups. The ingress label edge router inspects the flow information of a packet and maps it to an entropy label, which is inserted into the BGP label stack. LSRs in the core use this entropy label as the key to hash the packet and direct it to the correct path.

Options

elc-v2-compatible	Send and accept ELCv2 in addition to ELCv3
import	Policy to select BGP LSPs to use entropy label
no-next-hop-validation	Don't validate next hop field against route next hop

Required Privilege Level

entropy-label (protocols mpls)

IN THIS SECTION

- Syntax | 6416
- Hierarchy Level | 6416
- Description | 6416
- Options | 6416
- Required Privilege Level | 6417
- Release Information | 6417

Syntax

```
entropy-label {
    ingress-policy ingress-policy-name;
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols ldp]
```

Description

Assists the transit router in load-balancing MPLS traffic across ECMP paths or Link Aggregation groups by introducing the entropy label to the MPLS label stack. The entropy label allows routers to load balance MPLS traffic by using a hash-input without the need to perform deep packet inspection. Deep packet inspection requires more of the router's processing power and is not a capability shared by all routers.

Options

The other statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.1.

environment-monitoring-policy (satellite-management)

IN THIS SECTION

- Syntax | 6417
- Hierarchy Level | 6418
- Description | 6418
- Default | 6418
- Options | 6418
- Required Privilege Level | 6418
- Release Information | 6419

Syntax

```
environment-monitoring-policy policy-name;
```

Hierarchy Level

```
[edit chassis satellite-management]
[edit chassis satellite-management fpc slot-id]
```

Description

Enable an environment monitoring policy in a Junos Fusion.

You configure environment monitoring policies for a Junos Fusion in the [`edit policy-options environment-monitoring-policy` *`policy-name`*] hierarchy.

You can configure an environment monitoring policy in a Junos Fusion for a single satellite device using the **fpc *slot-id*** option, or for all satellite devices in the Junos Fusion by not specifying the **fpc *slot-id*** option.

You can configure a different environment monitoring policy for a single satellite device using the **fpc *slot-id*** when an environment monitoring policy for all satellite devices is configured. The environment monitoring policy for the FPC is enabled in cases when both an individual and global environment monitoring policy are configured.

Default

No environment monitoring policies for the Junos Fusion are present.

If you enable an environment monitoring policy in a Junos Fusion without specifying the **fpc *slot-id*** option, the environment monitoring policy is applied for all satellite devices in the Junos Fusion.

Options

policy-name

Specifies the name of the environment monitoring policy.

The *policy-name* name is defined as part of the environment monitoring policy configuration procedure, which is handled in the [`edit policy-options environment-monitoring-policy` *`policy-name`*] hierarchy.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.2R3.

- Syntax | 6419
- Hierarchy Level | 6420
- Description | 6420
- Options | 6420
- Required Privilege Level | 6420
- Release Information | 6420

Syntax

```
environment-monitoring-policy policy-name {
    alarm {
        linkdown [ignore | red | yellow]
    }
    term term-name{
        from {
            product-model model-name;
        }
    }
}
```

Hierarchy Level

```
[edit policy-options satellite-policies]
```

Description

Configure an environment monitoring satellite policy for a device or devices in a Junos Fusion.

An environment monitoring satellite policy is used to configure alarm behavior on satellite devices in a Junos Fusion.

The environment monitoring policy is applied to a Junos Fusion using the `environment-monitoring-policy` statement in the [edit chassis "satellite-management" on page 16310] or [edit chassis "satellite-management" on page 16310 "fpc" on page 7512 *slot-id*] hierarchy levels.

Options

policy-name Specifies the user-defined name of the environment monitoring policy.

The remaining statements are explained separately.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.2R3.

epacl-firewall-optimization

IN THIS SECTION

- Syntax | 6421
- Hierarchy Level | 6421
- Description | 6421
- Default | 6422
- Required Privilege Level | 6422
- Release Information | 6422

Syntax

```
epacl-firewall-optimization
```

Hierarchy Level

```
[edit chassis forwarding-options]
```

Description

Enable `epacl-firewall-optimization` to use Layer 2 and Layer 3 match conditions in firewall filters to support micro-segmentation on VXLAN deployments. Filtering in both the ingress and egress directions is supported. (For egress filtering on VLANs, this statement is not needed.)

For example, to create micro-segmentation in a VXLAN, you need to enable the `epacl-firewall-optimization` statement at the `[chassis]` level of the hierarchy, and then create the firewall rules with the match conditions that you want to filter on.

For both VLANs and VXLANs, you can use the following match conditions:

- `ip-source-address`
- `ip-destination-address`
- `destination-port`

- `user-vlan-id`
- `source-mac-address`
- `destination-mac-address`
- `ip-protocol`

Valid actions are `accept`, `count`, and `discard`.

The configuration sample below shows how to configure a QFX5110 Series switch that is part of a VXLAN to provide Layer 2 filtering in the egress direction. First we enable `epacl-firewall-optimization` on the device, and then we create a Layer 2 egress firewall filter named **epacl**, and attach it to the `xe-0/0/10.0` interface. The first term tells the switch to accept and count packets from the specified source MAC address (00:00:5e:00:53:a1/48). The second term tells the interface to count and discard all other packets.

```
set chassis forwarding-options epacl-firewall-optimization
set firewall family ethernet-switching filter epacl term t1 from source-mac-address
00:00:5e:00:53:a1/48
set firewall family ethernet-switching filter epacl term t1 then accept
set firewall family ethernet-switching filter epacl term t1 then count epacl-accept
set firewall family ethernet-switching filter epacl term t2 then discard
set firewall family ethernet-switching filter epacl term t2 then count epacl-discard
set interfaces xe-0/0/10 unit 0 family ethernet-switching filter output epacl
```

Default

Not enabled.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 21.1R1 for QFX5110 and QFX5120 Series switches.

}
```

Hierarchy Level

```
[edit system configuration-database]
```

Description

Configure settings for the ephemeral configuration database.

The ephemeral database is an alternate configuration database that enables Juniper Extension Toolkit (JET) applications and NETCONF and Junos XML protocol client applications to simultaneously load and commit configuration changes on Junos devices and with significantly greater throughput than when committing data to the candidate configuration database. Junos devices provide a default ephemeral database instance as well as the ability to configure multiple user-defined instances of the ephemeral configuration database.

The ephemeral database is not subject to the same verification required in the static configuration database. As a result, the ephemeral configuration database does not support configuration groups or interface ranges, or macros, commit scripts, or translation scripts. Additionally, certain configuration statements cannot be configured through the ephemeral database as described in *Unsupported Configuration Statements in the Ephemeral Configuration Database*. A Junos device validates the syntax but does not validate the semantics of configuration data committed to the ephemeral database. Therefore, all configuration data must be validated before loading it into the ephemeral database and committing it on the device. If you commit invalid configuration data to the database, it can cause Junos processes to restart or even crash and result in disruption to the system or network.

NOTE: When you configure statements at the `[edit system configuration-database ephemeral]` hierarchy level and commit the configuration, all Junos processes must check and evaluate their complete configuration, which might cause a spike in CPU utilization, potentially impacting other critical software processes.

NOTE: When you use the ephemeral configuration database, commit operations on the static configuration database might take longer, because additional operations must be performed to merge the static and ephemeral configuration data.

By default, the ephemeral database performs commit synchronize operations asynchronously. We do *not* recommend using the ephemeral database with the asynchronous commit model on devices that have graceful Routing Engine switchover (GRES) enabled. If you elect to use the ephemeral database when GRES is enabled, you must explicitly configure the `allow-commit-synchronize-with-gres` statement to enable the device to synchronize ephemeral configuration data to the backup Routing Engine when you request a commit synchronize operation on an ephemeral instance. The ephemeral database also

supports a synchronous commit model for commit synchronize operations. The synchronous commit model enables you to use the ephemeral database with greater reliability on devices that have high availability features enabled.

Ephemeral configuration data does not persist across reboots. In addition, when you install a package that requires rebuilding the Junos schema, such as an OpenConfig or YANG package, the device deletes all ephemeral configuration data in the process of rebuilding the schema.

Options

allow-commit-synchronize-with-gres

Enable a device that has GRES enabled and that uses the asynchronous commit synchronize model for the ephemeral database to synchronize an ephemeral instance to the backup Routing Engine when you request a commit synchronize operation on the instance.

commit-synchronize-model (asynchronous | synchronous)

Specify how the device synchronizes ephemeral configuration data in a dual Routing Engine or Virtual Chassis environment.

Synchronous commit operations are slower than asynchronous commit operations but provide better assurance that the ephemeral configuration is synchronized across Routing Engines and Virtual Chassis members.

- **Default:** `asynchronous`

cyclic-version-for-ephemeral-default *version*

Number of versions of the default ephemeral database for which the system stores deleted configuration objects. After each commit, the device reclaims the space occupied by objects deleted in the previous database version relative to the current database version as determined by the cyclic version value. You can disable cyclic versioning by setting the value to 0.

Thus, starting with the 11th commit operation, the device, by default, reclaims the space occupied by objects deleted in version 1 of the database. The process continues with each subsequent commit operation.

- **Default:** 10
- **Range:** 0 through 4,294,967,295

delete-ephemeral-default

Delete the configuration data and files for the default instance of the ephemeral configuration database. When you configure this statement, you must also configure the `ignore-ephemeral-default` statement.

ignore-ephemeral-default

Disable the default instance of the ephemeral configuration database.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

maintenance—To view or add this statement in the configuration.

Release Information

Statement introduced in Junos OS Release 16.2R2 and Junos OS Evolved Release 22.1R1.

`commit-synchronize-model` option added in Junos OS Release 21.1R1.

`delete-ephemeral-default` statement added in Junos OS Release 22.1R1.

`cyclic-version-for-ephemeral-default` statement added in Junos OS Release 23.2R1 and Junos OS Evolved Release 23.2R1.

Description

Configure the exact match criteria used with the DHCP relay agent selective processing feature. DHCP relay agent compares the configured match string with the option-specific string received in DHCP

client packets. If there is an exact left-to-right match, DHCP performs the action you define for the match criteria.

You can configure an unlimited number of match strings. Match strings do not support wildcard attributes.

The `local-server-group` option is not supported for DHCPv6 relay agent.

Options

ascii-string ASCII string of 1 through 255 alphanumeric characters.

hexadecimal-string Hexadecimal string of 1 through 255 hexadecimal characters (0 through 9, a through f, A through F).

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

eracl-ip6-match (packet-forwarding-options)

IN THIS SECTION

- Syntax | 6436
- Hierarchy Level | 6436
- Description | 6436
- Options | 6436

Required Privilege Level | 6437
Release Information | 6437

Syntax

```
eracl-ip6-match {
    (srcip6-and-destip6 | srcip6-only);
    }
}
```

Hierarchy Level

```
[edit system packet-forwarding-options]
```

Description

Use the options of this command to allow source and/or destination IPv6 address match conditions for eRACL inet6 filters.

In Junos, firewall filters are classified as *ingress* or *egress* depending on where in the sequence the packet is evaluated and action taken. Filtering IPv6 traffic on an `inet6` egress interface can be useful, for example, for safeguarding a third-party device connected to the Juniper switch.

NOTE: After configuring, modifying, or deleting the `eracl-ip6-match` statement, you must commit the configuration, and the packet forwarding engine (PFE) must be restarted.

Options

eracl-ip6-match Configuring match conditions in a firewall filter for IPv6 source and/or destination IP addresses is only allowed if the `srcip6-and-destip6` or the `srcip6-only` options described below are enabled. The two options cannot both be enabled at the same time. If neither option is configured, the default behavior is to allow match condition to be created for IPv6 destination addresses on egress interfaces only.

- Values:
  - **srcip6-and-destip6**—Choose this option to allow both source and destination IPv6 address match conditions on inet6 interfaces in egress direction. The source and destination port match conditions are also allowed only with this option. Note that when this option is enabled, the scale of eRACLv6 is reduced by half.
  - **srcip6-only**—Choosing this option allows the source IPv6 address match condition in eRACLv6 filters but not a destination address. Both source and destination port match conditions cannot be configured at the same time as this option is enabled (you will get a commit error).

eracl-profile (packet-forwarding-options)

IN THIS SECTION

- Syntax | 6438
- Hierarchy Level | 6438
- Description | 6438
- Options | 6438
- Required Privilege Level | 6439
- Release Information | 6439

Syntax

```
eracl-profile {
    eracl-scale;
}
```

Hierarchy Level

```
[edit system packet-forwarding-options firewall]
[edit system packet-forwarding-options firewall eracl-profile eracl-scale]
```

Description

Use the option of this command to configure egress firewall filters, also known as eRACLs, in scaled mode. This feature is supported only in the egress direction (routed traffic exiting the device).

In Junos, firewall filters are classified as ingress or egress depending on where in the sequence the packet is evaluated and action taken. Filtering traffic on an egress interface can be useful, for example, for safeguarding a third-party device connected to the Juniper switch.

Options

eracl-scale Use this option to increase the number of egress firewall filters to 2000. When you configure an egress filter in scaled mode, the switch uses ingress TCAM space (IFP) to achieve the higher scale.

> **NOTE**: After configuring, modifying, or deleting the `eracl-profile` statement, you must commit the configuration, and the packet forwarding engine (PFE) must be restarted.

When you enable `eracl-scale` mode, the following restrictions apply:

- You can only apply a filter in the egress direction (traffic exiting the VLAN).
- Only `inet` and `inet6` protocol families are supported.
- Generic Routing Encapsulation (GRE) interfaces are not supported.

- You cannot apply filters with the same match condition to different egress VLANs or Layer 3 interfaces. The only supported actions are `accept`, `discard`, and `count`.
- Match conditions are programmed in the ingress firewall filter TCAM. This means that any counters attached to the filter counts traffic on any incoming VLANs.
- The `eracl-scale` option comes configured in global mode. When enabled, any of your existing egress filters will be automatically reinstalled in scaled mode.

[edit chassis]

[edit chassis fpc *slot-number*]

[edit chassis sib slot *slot-number*]

Junos OS Evolved

[edit chassis fpc *slot-number*]

[edit chassis sib slot *slot-number*]

Description

Configure the threshold at which FPC or SIB errors will take the action you configure to be performed by the device. Starting from Junos OS Release 18.1R3, you can configure error thresholds and actions at the error scope and error category levels on MX Series routers.

Some Juniper devices include an internal framework for detecting and correcting FPC errors that can have the potential to affect services. You can classify the errors according to severity, set an automatic recovery action for each severity, and set a threshold (i.e., the number of times the error must occur before the action is triggered). Using the configuration command for error levels, you can isolate PFE errors, thereby reducing the need for a field replacement of FPCs. For feature details and PTX platforms supported, see FPC self-healing.

NOTE:

- On the MX104 routers, Junos does not initiate restart of the system on encountering a Fatal error. Additionally, though you can configure the action `disable-pfe` for Major errors on the MX104, the router does not disable its only PFE on encountering a Major error.

Options

You can configure the threshold for the following severity levels:

- `fatal`—Fatal error on the FPC. An error that results in blockage of considerable amount of traffic across modules is a fatal error.
- `major`—Major error on the FPC. An error that results in continuing loss of packet traffic but does not affect other modules is a major error.
- `minor`—Minor error on the FPC. An error that results in the loss of a single packet but is fully recoverable is a minor error.
- `threshold` *`threshold-value`*—Configure the threshold value at which to take action. If the severity level of the error is fatal, the action is carried out only once when the total number of errors crosses the threshold value. If the severity level of the error is major, the action is carried out once after the occurrence crosses the threshold. If the severity level is minor, the action is carried out as many times as the value specified by the threshold. For example, when the severity level is minor, and you have configured the threshold value as 10, the action is carried out after the tenth occurrence. On Junos OS Evolved, for the errors belonging to the `internal` category, the default threshold value is 1.

  NOTE: You can set the threshold value to 0 for errors with severity level as minor. This implies that no action is taken for that error. You cannot set the threshold value to 0 for errors with severity level as major or fatal.

  Default: The error count for fatal and major actions is 1. The default error count for minor actions is 10.

  Range: 0—429,496,729

The available detection and recovery actions are as follows:

- `alarm`—Raise an alarm.
- `disable-pfe`—Disable the PFE interfaces on the FPC.
- `get-state`—Get the current state of the FPC.
- `log`—Generate a log for the event.
- `offline`—Take the FPC offline.
- `offline-pic`—Take the PIC (installed in the FPC) offline.
- `reset`—Reset the FPC.
- `reset-pfe`—Reset the PFE. (Supported for PTX series devices including PTX10003)
- `offline-pfe`—Take the PFE offline.
- `trap`—Raise traps for the FPC errors.

> **NOTE**: Starting in Junos OS Evolved Release 19.1R1, the `offline` and `disable-pfe` actions are not available for errors with `minor` severity (under the hierarchy `edit chassis error minor action`).
>
> Starting in Junos OS Release 21.4R3, the additional options for reset PFE are valid only for line cards MPC7, MPC8, and MPC9, for the platforms MX240, MX480, MX960, MX2008, MX2010, and MX2020.

The available detection and recovery actions are as follows for devices running Junos OS Evolved:

- `alarm`—Raise an alarm.
- `fault`—System goes to fault state but stays up (diagnostics can be run on it).
- `get-state`—Get the current state of the FPC.
- `log`—Generate a log for the event.

> **NOTE**: Starting in Junos OS Release 17.2R1, if you configure the `disable-pfe`, `offline`, `offline-pic` or `reset` action on an MX Series or PTX Series router, the `get-state` action is additionally configured on the router. This means, for example, if you configure the `disable-pfe` action on the router, the router gets both `disable-pfe` and `get-state` actions configured.

- `scope` *`error-scope`*—Group the errors of a particular severity into different scopes. Errors belonging to each error scope is further grouped into categories, before thresholds and actions are defined at the group level. The following scopes are available: `board` and `pfe`. Junos OS Evolved also supports the scope `switch`.

- `category` *`category`*—Categorize errors into various subgroups under the scope level. An error category helps you group similar errors belonging to a particular scope and define actions for them at once. This feature eliminates the need for configurations against individual error-ids. Some of the error-categories are `functional`, `io` (input/output errors), `storage` (for example, errors related to HDD, SSD, and flash), `memory` (for example, errors related to static RAM), `processing` (for example, CPU-related errors), and `switch`. Junos OS Evolved also supports the category `internal`. On every occurrence of an error belonging to the `internal` category, the software by default raises an alarm at the individual error level (not at the scope or category level). You cannot configure an action against errors belonging to the `internal` category.

- *severity-level* – Configure the severity levels associated to each `error-id`. The options are `fatal`, `major` and `minor`.

- *`error-id`*—Use the error ID to disable an error or modify the error severity associated with that error. An *error-id*, which is a unique error identifier, is represented as a Uniform Resource Identifier (URI). For example, `/cpu/0/memory/0/memory-uncorrected-error` is an error ID that indicates an uncorrectable error under CPU memory module instance `0`.

- state—State

  - disable—Disable error.

- `reset-pfe`—Configure thresholds associated to reset-pfe action.

  - `pause-period` *`<pause_minutes>`*— Pause period in minutes. Valid range is 0 to 10000000.

  - `pfe-disable-period` *`<pfe_disable_minutes>`*— PFE disable period in minutes before reset PFE. Valid range is 1 to 10000000. The PFE disable period must be greater than the pause period.

  - `retry limit` *`<retry_number>`*— Retry limit for reset PFE. Valid range is 0 to 3.

Required Privilege Level

interface	To view this statement in the configuration.
interface-control	To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.3.

Reset-pfe error action support added to PTX10003 in Junos OS Evolved Release 22.4R1.

error {
    (fatal | major | minor) {
    threshold threshold number;
    action (alarm | disable-pfe | offline-pic | log | get-state |offline | reset);
    }
}
```

Hierarchy Level

```
[edit chassis]

[edit chassis fpc slot-number]
```

Description

Configure the threshold at which FPC errors will take the action you configure to be performed by the device.

Some devices include an internal framework for detecting and correcting FPC errors that can have the potential to affect services. You can classify FPC errors according to severity, set an automatic recovery action for each severity, and set a threshold (the number of times the error must occur before the action is triggered).

However, the alarm is added to the default fault handling action list for a fatal error. Adding an alarm to the default fault handling list will allow the chassis alarm to trigger the RG1 switchover as soon as the fatal error is detected.

Starting with Junos OS Release 15.1-X49-D50 and Junos OS Release 17.3R1, this feature supports I/O cards (IOCs) and Services Processing Cards (SPCs) on the Junos OS SRX5000 line of devices. The following cards are supported:

- IOC2
- IOC3
- SPC2

CAUTION: Take care when setting the fault handling actions for SPC2 cards on the SRX5000 line of devices. Consider that if you set the fault handling action on an SPC2 card to offline or reset, when the card is either taken offline or the reboot occurs, the chassis daemon (chassisd) will reboot all of its FPC cards, both SPCs and IOCs—that is, the entire chassis will be rebooted.

Options

You can configure the threshold for the following severity levels:

NOTE: You cannot change the severity level of an error.

- `fatal`—Fatal error on the FPC. An error that results in the blockage of a considerable amount of traffic across modules is a fatal error. (default: raise an alarm and reset the FPC)
- `major`—Major error on the FPC. An error that results in continuing loss of packet traffic but does not affect other modules is a major error. (default: get the current state of the FPC and raise an alarm)
- `minor`—Minor error on the FPC. An error that results in the loss of a small number of packets but is fully recoverable is a minor error. (default: write a log for the event.)
- `threshold` *`threshold-value`*—Configure the threshold value at which to take action. If the severity level of the error is fatal, the action is carried out only once when the total number of errors exceeds the threshold value. If the severity level of the error is major, the action is carried out once after the occurrence exceeds the threshold. If the severity level is minor, the action is carried out as many times as the value specified by the threshold. For example, when the severity level is minor, and you have configured the threshold value as 10, the action is carried out after the tenth occurrence.

  > **NOTE**: You can set the threshold value to 0 for errors with a severity level of minor. This implies that no action is taken for that error. You cannot set the threshold value to 0 for errors with a severity level of major or fatal.

  Reset and offline are not listed as default actions for the minor error level for safety purposes.

  The alarm and reset default action is included in the implementation for the SRX5000 line of devices. It is required to trigger the RG1 switchover in a chassis cluster environment when an FPC fatal error occurs and the alarm being raised is a major alarm.

  Default: The error count for fatal and major actions is 1. The default error count for minor actions is 10.

  Table 38 on page 6448 shows the range of values for each error level.

  Table 38: Value Ranges for Error Levels

Error Level	Default Threshold	Value Range
Fatal	1	1 through 1024
Major	1	1 through 1024
Minor	10	0 through 1024

The available detection and recovery actions are as follows:

- `alarm`—Raise an alarm.
- `disable-pfe`—Disable the Packet Forwarding Engine interfaces on the FPC.
- `get-state`—Get the current state of the FPC.
- `log`—Generate a log for the event.
- `offline`—Take the FPC offline.
- `offline-pic`—Take the PIC (installed in the FPC) offline.
- `reset`—Reset the FPC.

}
```

Hierarchy Level

[edit chassis fpc *slot-number* error]

[edit chassis sib slot *slot-number* error]

Description

Manage an error by using the error identifier. This feature allows you to disable an error or modify its severity. The `disable` option allows you to stop the error from being reported in the system until the error is enabled again.

An *error-id*, a unique error identifier, is represented as a Uniform Resource Identifier (URI), and is composed of a module identifier and an error identifier. For example, the error-id "`/fpc/2/platformd/0/cm/0/precl/3/PRECL_CMERROR_INQ_BUF_OVERFLOW`" indicates a CM error due to buffer overflow.

Options

- `severity`—Apply a new severity to the error ID. You can apply any of the following severities:
  - `fatal`—Fatal error on the FPC. An error that results in blockage of considerable amount of traffic across modules is a fatal error.
  - `major`—Major error on the FPC. An error that results in continuing loss of packet traffic but does not affect other modules is a major error.

- `minor`—Minor error on the FPC. An error that results in the loss of a single packet but is fully recoverable is a minor error.

- `state`—By default, an error is in “enabled” state.
  - `disable`—Disable an error.

Required Privilege Level

Description

Configure an Ethernet Segment Identifier (ESI) in either EVPN multihoming active/standby or active/active mode by using one of the following methods:

- Manually configure an ESI on a physical, aggregated Ethernet, or logical interface using the `esi identifier` configuration statement.
- Configure an aggregated Ethernet interface or aggregated Ethernet logical interface to automatically derive an ESI from the Link Aggregation Control Protocol (LACP) configuration. Use the `auto-derive lacp` configuration statement.

  If you configure automatic ESI on an aggregated Ethernet interface, the device generates an ESI. The device assigns that particular ESI to all logical interfaces on the aggregated Ethernet interface. You can also configure automatic ESI on one or more logical interfaces on an aggregated Ethernet interface. In that case, the device generates an ESI for each logical interface on which you enabled the feature.

> **NOTE**: You can't commit a configuration in which you try to configure the following on the same physical or logical aggregated Ethernet interface:
>
> - Manually configure an ESI on the aggregated Ethernet interface.
> - Enable the automatic ESI feature on the aggregated Ethernet interface.

Starting in Junos OS Releases 15.1F6 and 17.1R1 for MX Series routers and Junos OS Release 17.3R1 for EX9200 switches, you can specify an ESI on a logical interface. In earlier releases, you can configure an ESI only on a physical or aggregated Ethernet interface. For example:

```
set interfaces ae0 esi 00:11:22:33:44:55:66:77:88:99
```

When configuring an ESI, remember that the ESI is a factor in the designated forwarder (DF) election process. For example, let's look at a case in which you configure EVPN multihoming active/standby on aggregated Ethernet interface ae0. In this case, ae0 also has logical interfaces on unit 1 and unit 2. The DF election process might put ae0 into the down state due to the ESI and other determining factors.

The logical interfaces configured on ae0 would also be down, and unable to provide services to their respective customer sites (VLANs).

If you specify an ESI on a logical interface, the DF election process now occurs at the individual logical interface level. You can better utilize logical interfaces. For example, you configure logical interfaces ae0.1 and ae0.2 on aggregated Ethernet interface ae0. You also enable EVPN multihoming active-standby on both logical interfaces. Then the DF election brings ae0.1 down based on the ESI on ae0.1 and other DF determining factors. Despite logical interface ae0.1 being down, logical interface ae0.2 and other ae0 logical interfaces can remain up. The DF election process doesn't disrupt customer services to the respective customer sites (VLANs).

NOTE: A physical interface on which you configure an ESI won't become a DF if any one of its logical units is down. As a result, if you don't want logical interfaces in one unit to forward traffic, then delete the logical unit rather than disabling it. We recommend that you do not explicitly disable any logical units associated with a physical interface on which you configured an ESI.

Options

identifier Ten octet value. Reserved values: ESI value 0 and all fixed filters. You can't use the reserved values for configuring a multihomed Ethernet segment.

NOTE:

- You can't configure two interfaces (physical, logical, or aggregated Ethernet) with the same ESI value. However, starting with Junos 24.2R1 for MX Series routers supporting ESI per EVPN instance (EVI), users can configure multiple logical interfaces (IFLs) with the same ESI value, but they need to be part of the same bridge-domain. See "per-evi" on page 12409 for more information.
- The left most octet must be configured as 00. The other 9 octets are fully configurable.

all-active Configure the EVPN active-active multihoming mode of operation.

single-active Configure the EVPN active-standby multihoming mode of operation.

NOTE: We don't support active-standby multihoming mode on QFX Series switches or in EVPN configurations with VXLAN overlays. As a result, if

you configure the `single-active` option on QFX Series switches or in EVPN-VXLAN configurations, the device ignores that configuration item.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

```

Description

Configure `ether-options` properties for a Gigabit Ethernet or 10-Gigabit Ethernet interface.

In Junos OS Evolved, when you configure `set interfaces interface ether-options 802.3ad ae name` at the same time as you apply a second configuration to the same interface at the `[edit interfaces interface]` hierarchy, the second configuration will not take effect until the interface joins the aggregated Ethernet interface *ae name*.

> **NOTE**: The `ether-options` statement is not supported for subscriber management on aggregated Ethernet member link interfaces. You must configure `gigether-options` instead.

Table 39 on page 6465 shows the supported and unsupported platforms.

Table 39: Supported Platform Information

Supported Platforms for gigether-options	Supported Platforms for ether-options	Notes
ACX Series Routers (Junos OS) • ACX500 • ACX710 • ACX1000 • ACX1100 • ACX2100 • ACX2200 • ACX4000 • ACX5400 • ACX5448 • ACX5048 • ACX5096	ACX Series Routers (Junos OS) • ACX5048 • ACX5096	To configure storm control on the ACX Series routers, use `ether-options`.

Table 39: Supported Platform Information *(Continued)*

Supported Platforms for gigether-options	Supported Platforms for ether-options	Notes
EX Series Switches (Junos OS) • EX4300 Multigigabit • EX4600 • EX4650 • EX9200 • EX9250	EX Series Switches (Junos OS) • EX2300 • EX2300 Multigigabit • EX2300-C • EX3400 • EX4300 • EX4300 Multigigabit • EX4600 • EX4650 • EX9200 • EX9250	EX Series Switches (Junos OS) EX Series switches support both `ether-options` and `gigether-options`. To configure Ethernet configuration options such as loopback, flow-control, auto-negotiation etc., use `ether-options`. To configure Forward Error Correction (FEC), use `gigether-options`. **NOTE**: For all EX Series Switches except EX9200 series, use `ether-options` for all ethernet configuration options except FEC option. You must use `gigether-options` for configuring FEC.

Table 39: Supported Platform Information *(Continued)*

Supported Platforms for gigether-options	Supported Platforms for ether-options	Notes
MX Series Routers (Junos OS) • MX5 • MX10 • MX40 • MX80 • MX104 • MX150 • MX204 • MX240 • MX480 • MX960 • MX20008 • MX2010 • MX2020 • MX10003 • MX10008 and MX10016	Not Supported	None

ether-type (Chassis FPC)

IN THIS SECTION

- Syntax | 6477
- Hierarchy Level | 6478
- Description | 6478
- Options | 6479
- Required Privilege Level | 6479
- Release Information | 6479

Syntax

```
ether-type index etype
```

Hierarchy Level

```
[edit chassis fpc slot]
```

Description

Add or remove a custom EtherType value in the ternary content addressable memory (TCAM) table of EtherType values for a specified FPC slot number on the device.

Ethernet frame headers contain an EtherType field (two octets in length) to identify the protocol in the frame's payload so that a receiving device knows how to process the Layer 2 traffic. The device maintains a list of the default EtherType values in TCAM on each FPC on the device for fast access. Use this statement to configure a custom EtherType value in TCAM on a particular FPC in place of the default value at the specified index in the TCAM table.

For example, to replace the default value in TCAM on FCP 0 at index 24 with EtherType value 0x8890:

```
set chassis fpc 0 ether-type 24 0x8890
```

NOTE: This command doesn't check for or prevent you from adding duplicate values.

The device retains the default values stored at each index. If you set a custom EtherType value and then delete that configuration item, the device restores the default value for that index.

To remove a custom setting, delete the configuration item using the index where you configured the custom EtherType. You don't need to specify the EtherType value you set at that index. For example:

```
delete chassis fpc 0 ether-type 24
```

The default EtherType values in TCAM might differ across Junos OS releases and device types. Enter the `show chassis fpc ether-types` command to see the default and active EtherType values on one or all FPCs on the device. If you configured a custom value at a particular index, the ACTIVE column shows that value instead of the default value.

Some EtherType values are reserved, and you can't change or configure those values. For those values, the `show chassis fpc ether-types` command displays NO in the CONFIGURABLE output column for the corresponding index. Reserved values are stored at TCAM indexes 0-5 and 28-31, so you can only configure custom values at indexes 6 through 27.

Options

index (Required) EtherTypes TCAM table index where you want to replace the default EtherType value with a new EtherType value. The TCAM table can hold up to 32 EtherType entries, but ten locations (0-5 and 28-31) are reserved for default EtherTypes that can't be reconfigured.

- Range: 6-27

etype (Required) EtherType value in hexadecimal format (0x*nnnn*) that you want to add at *index* in the EtherTypes TCAM table.

Reserved EtherTypes that you can't change in TCAM include:

- 0x0800—IPv4
- 0x86DD—IPv6
- 0x0806—ARP
- 0x88CC—LLDP
- 0x8809—LACP
- 0x8035—Reverse Address Resolution Protocol (RARP)
- 0x8100—VLAN-tagged frames for customer VLANs
- 0x88a8—Service VLAN tagged frames for provider bridging
- 0x9100—VLAN-tagged frames with double tagging for Q-in-Q tunneling
- 0x9200—VLAN-tagged frames with triple tagging

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Introduced in Junos OS Release 21.1R1.

Hierarchy Level

```
[edit protocols oam]
```

Description

Provide IEEE 802.3ah Operation, Administration, and Maintenance (OAM) support for Ethernet interfaces or configure connectivity fault management (CFM) for IEEE 802.1ag Operation, Administration, and Management (OAM) support.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.2.

`connectivity-fault-management` introduced in Junos OS Release 10.2 for EX Series switches.

```

Hierarchy Level

```
[edit interfaces interface-name gigether-options],
[edit interfaces interface-name aggregated-ether-options],
[edit interfaces interface-name aggregated-ether-options],
[edit interfaces interface-name ether-options]
```

Description

NOTE: On QFX Series standalone switches, the `ethernet-policer-profile` CLI hierarchy and the `mac-learn-enable` statement are supported only on the Enhanced Layer 2 Switching CLI.

For Gigabit Ethernet IQ, 10-Gigabit Ethernet IQ2 and IQ2-E, and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC, aggregated Ethernet with Gigabit Ethernet IQ interfaces, the built-in Gigabit Ethernet port on the M7i router); 100-Gigabit Ethernet Type 5 PIC with CFP; and Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, and aggregated Ethernet interfaces on EX Series switches, configure VLAN tag and MAC address accounting and filtering properties.

The remaining statements are explained separately. See CLI Explorer.

NOTE: When you gather interfaces into a bridge domain, the `no-mac-learn-enable` statement at the `[edit interfaces interface-name gigether-options ethernet-switch-profile]` hierarchy level is not supported. You must use the `no-mac-learning` statement at the `[edit bridge-domains bridge-domain-name bridge-options interface interface-name]` hierarchy level to disable MAC learning on an interface in a bridge domain. For information on disabling MAC learning for a bridge domain, see the *MX Series Layer 2 Configuration Guide*.

Default

If the `ethernet-switch-profile` statement is not configured, Gigabit Ethernet IQ and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router) behave like Gigabit Ethernet interfaces.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.

         members [ (all | names | vlan-ids) ];
    }
}
```

Syntax (SRX Series)

```
ethernet-switching {
    block-non-ip-all;
    bpdu-vlan-flooding;
    bypass-non-ip-unicast;
    no-packet-flooding {
        no-trace-route;
    }
}
```

Hierarchy Level

For EX Series and QFX Series switches:

```
[edit interfaces ge-chassis/slot/port unit logical-unit-number] family
```

For SRX Series Firewalls:

```
[edit security flow]
```

Description

Configure Ethernet switching protocol family information for the logical interface. Changes default Layer 2 forwarding behavior.

The remaining statements are explained separately. See CLI Explorer.

Default

You must configure a logical interface to be able to use the physical device.

Options

- `block-non-ip-all`—Block all Layer 2 non-IP and non-ARP traffic, including multicast and broadcast traffic.

- `bpdu-vlan-flooding`—Set 802.1D bridge protocol data unit (BPDU) flooding based on VLAN on which BPDU originate. The default behavior is to receive BPDUs and then flood BPDUs out to all active ports on the SRX Series Firewalls.
- `bypass-non-ip-unicast`—Allow all Layer 2 non-IP traffic to pass through the device.
- `no-packet-flooding`—Stop IP flooding and send ARP or ICMP requests to discover the destination MAC address for a unicast packet.

  NOTE: On all SRX Series Firewalls in transparent mode, packet flooding is enabled by default. If you have manually disabled packet flooding with the set security flow ethernet-switching no-packet-flooding command, then multicast packets such as OSPFv3 hello packets are dropped.

  - `no-trace-route`—Do not send ICMP requests to discover the destination MAC address for a unicast packet. Only ARP requests are sent. This option only allows the device to discover the destination MAC address for a unicast packet if the destination IP address is in the same subnetwork as the ingress IP address.

NOTE: The `block-non-ip-all` and `bypass-non-ip-unicast` options cannot be configured at the same time.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

security—To view this in the configuration.

security-control—To add this to the configuration.

Release Information

Statement introduced in Junos OS Release 9.5.

ethernet-switching (Port Mirroring)

IN THIS SECTION

- Syntax | 6513
- Hierarchy Level | 6514
- Description | 6514
- Required Privilege Level | 6514
- Release Information | 6514

Syntax

```
ethernet-switching;
output {
    interface interface-name {
    }
    no-filter-check;
    }
    vlan vlan-name {
        no-tag;
    }
}
```

Hierarchy Level

```
[edit forwarding-options port-mirroring [instance name] family]
```

Description

Specify that the output interface for the port mirror will be configured as an `ethernet-switching` interface.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2.

ethernet-vlan (Protocols Link Management)

IN THIS SECTION

- Syntax | 6515
- Hierarchy Level | 6515
- Description | 6515
- Options | 6515
- Required Privilege Level | 6515
- Release Information | 6515

Syntax

```
ethernet-label {
    vlan-id-range vlan-id-range;
}
```

Hierarchy Level

```
[edit protocols link-management te-link te-link-name]
```

Description

Specify the TE-link to be used for Layer 2 VLAN label-switched path (LSP).

Options

vlan-id-range *vlan-id-range*	Pool of VALN IDs.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.2.

eui-64

IN THIS SECTION

Syntax | 6516

- Hierarchy Level | 6516
- Description | 6516
- Required Privilege Level | 6516
- Release Information | 6516

Syntax

```
eui-64;
```

Hierarchy Level

```
[edit interfaces interface-name unit number family inet6 address address]
```

Description

For interfaces that carry IP version 6 (IPv6) traffic, automatically generate the host number portion of interface addresses.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

RELATED DOCUMENTATION

Configuring the Interface Address

evc-protocol cfm

IN THIS SECTION

- Syntax | 6517
- Hierarchy Level | 6517
- Description | 6517
- Options | 6517
- Required Privilege Level | 6518
- Release Information | 6518

Syntax

```
evc-protocol cfm {
    maintenance-association association-name | vpls routing-instance routing-id;
    maintenance-domain domain-id;
    mep-id mep-id;
}
```

Hierarchy Level

```
[edit protocols oam ethernet evcs]
```

Description

Specify connectivity fault management (CFM) or virtual private LAN service (VPLS) as the Ethernet virtual connection (EVC) protocol.

Options

management-domain *domain-id*	(Optional) For CFM, specify the CFM management domain.
management-association *association-id*	(Optional) For CFM, specify the CFM management association.

`routing-instance` *`instance-id`* (Optional) For VPLS, specify the VPLS routing instance.

`mep-id` *`mep-id`* (Required for CFM) Identifier for the maintenance association endpoint

> **NOTE**: This option is available on MX Series routers only.

- **Range:** 1 through 8191

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.5.

`mep-id` *`mep-id`* statement introduced in Junos OS Release 15.1.

evcs

IN THIS SECTION

- Syntax | **6519**
- Hierarchy Level | **6519**
- Description | **6519**
- Options | **6519**
- Required Privilege Level | **6519**

Release Information | 6520

Syntax

```
evcs evc-id {
    evc-protocol cfm;
    remote-uni-count count;
    multipoint-to-multipoint;
}
```

Hierarchy Level

```
[edit protocols oam ethernet]
```

Description

On MX Series routers with `ge`, `xe`, or `ae` interfaces, configure an OAM Ethernet virtual connection.

Options

`remote-uni-count` *count*—(Optional) Specify the number of remote UNIs in the EVC configuration, the default is 1.

`multipoint-to-multipoint`—(Optional) Specify multiple points in the EVC configuration, the default is point-to-point if `remote-uni-count` is 1.

Remaining options are explained separately.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.5.

event (Enhanced Subscriber Management)

IN THIS SECTION

- Syntax | 6523
- Hierarchy Level | 6524
- Description | 6524
- Options | 6524
- Required Privilege Level | 6524
- Release Information | 6524

Syntax

```
event {
    catastrophic-failure {
        reboot (master | standby);
    }
}
```

Hierarchy Level

```
[edit system services subscriber-management overrides]
```

Description

Configure the router to detect a type of event and automatically take action when the event is detected.

Options

catastrophic-failure Specify that the event is a corruption of the shared memory.

reboot (master | standby) Specify which Routing Engine is rebooted when the shared memory corruption is detected. You can configure both Routing Engines to be rebooted, but that requires two separate `set` commands.

> **NOTE**: If you do not configure this automatic reboot, then you must perform a manual reboot to clear out the shared memory. Otherwise, the memory remains corrupted and can cause applications that share the memory to generate core errors repeatedly.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 19.1R1.

Description

Enable an Ethernet VPN (EVPN) on the routing instance.

> **NOTE**: Starting in Junos OS Release 24.2R1, we renamed the `interconnect-multihoming-peer-gateways` option to "multihoming-peer-gateways" on page 8806 to support additional multihoming peer feature use cases besides interconnect scenarios. You won't see the `interconnect-multihoming-peer-gateways` statement in the Junos CLI anymore; use the new option name `multihoming-peer-gateways` for the same function.

Options

designated-forwarder-election-hold-time *seconds*

Time in seconds to wait before electing a designated forwarder (DF). Peer provider edge (PE) devices elect a designated forwarder (DF) when customer edge devices (CEs) are multihomed to more than one PE device. Without a designated forwarder, multihomed hosts would receive duplicate packets. The designated forwarder choice for an Ethernet segment identifier (ESI) is based on EVPN Type 4 route advertisements.

- **Range:** 1 through 1800 seconds

designated-forwarder-preference-highest

Use highest preference value for DF election for the EVPN instance (EVI). By default, the preference-based DF election is based on the highest preference value configured.

designated-forwarder-preference-least

Use least preference value for DF election for the EVPN instance (EVI). By default, the preference-based DF election is based on the highest preference value configured.

es-import-oldstyle

Enable non-compliant ES import route-target computation.

es-label-oldstyle

Enable devices to use the lower-order bits for the ESI label field. This non-compliant ESI 24-bit ESI label can be found in previous Junos OS versions.

esi

Ten octet value. Configure an ESI for the EVPN instance (EVI). Use this option when configuring `df-election-granularity` "per-evi" on page 12409 to support the ESI per EVI feature.

evpn-etree

Configure an Ethernet VPN E-TREE service.

leave-sync-route-oldstyle

Enable device to interoperate with devices that do not support the maximum response time attributes on EVPN Type 8 routes.

mac-mobility no-sequence-numbers Disable MAC mobility. This feature is enabled by default. See *Overview of MAC Mobility*.

no-core-isolation Disable the core isolation feature (enabled by default on supporting platforms), which is desirable in certain EVPN fabric use cases. See *Understanding When to Disable EVPN-VXLAN Core Isolation* for details.

peg-df-election-history *num* Number of PIM EVPN gateway (PEG) DF election history entries the device maintains per bridge domain (VLAN) on devices configured as PEG devices with optimized intersubnet multicast (OISM) . The device stores and displays up to this many entries in the output from the `show evpn oism peg-df-status extensive` command.

- **Range:** 0 through 255

pmsi-tunnel-endpoint *pmsi-tunnel-endpoint* Configure the PMSI tunnel endpoint on the ingress router to use the loopback address (router ID) that is the MPLS network PMSI tunnel endpoint for EVPN Type 3 routes.

smet-etag-carry-vid Enable a device to interoperate with other devices in the EVPN network that use VNIs (VLAN ID) as the Ethernet Tag ID.

The remaining statements are explained separately.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2.

`designated-forwarder-election-hold-time` *seconds* statement introduced in Junos OS Release 14.1.

`extended-vlan-list` *vlan-id* | [*vlan-id set*] statement introduced in Junos OS Release 14.1.

> **NOTE**: QFX10000 switches don't support the `extended-vlan-list` statement.

`designated-forwarder-preference-least` and `service-type` statements introduced in Junos OS Release 17.3 for MX Series routers with MPC interfaces and MIC interfaces.

`no-core-isolation` statement added in Junos OS Releases 17.3R3, 17.4R2, 18.1R3, 18.2R2, and 18.3R1.

Support for logical systems on MX Series routers added in Junos OS Release 17.4R1.

`p2mp-bud-support` statement introduced in Junos OS Release 18.2R1.

`assisted-replication` statement introduced in Junos OS Release 18.4R2 and 19.4R1.

`pmsi-tunnel-endpoint` statement introduced in Junos OS Release 20.3R1.

`oism` statement hierarchy introduced in Junos OS Release 21.2R1.

`irb-symmetric-routing` statement introduced in Junos OS Release 21.4R1.

`peg-df-election-history` statement introduced in Junos OS Release 23.4R1 and Junos OS Evolved Release 23.4R1.

`designated-forwarder-preference-highest` statement introduced in Junos OS Release 24.2R1.

Syntax

```
evpn-aliasing-optimize;
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-options forwarding-table ],
[edit routing-options forwarding-table]
```

Description

Enables EVPN aliasing optimization. EVPN aliasing optimization allows the device to quickly recover when a link to a multihomed PE device fails. It reduces reduces convergence time, and improves device performance. By default, `evpn-aliasing-optimize` is enabled on the PTX10008 Router.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Hierarchy Level

```
[edit services]
```

Description

Specify parameters to generate an Ethernet VPN (EVPN) fabric configuration with one or more customer edge (CE) devices or end servers that are:

- Single-homed to a provider edge (PE) device in the EVPN fabric.
- Multihomed on an Ethernet segment identified by an Ethernet segment identifier (ESI), and connected in a link aggregation group (LAG) to two or more PE devices in the EVPN Fabric.

> **NOTE**: We refer to this type of multihomed Ethernet segment connection as an ESI LAG. The feature you enable with statements in this hierarchy is an easy EVPN LAG configuration feature, also called EZ-LAG.

You use the statements at this hierarchy level to simplify setting up EVPN fabrics with ESI LAG configurations. You only need to configure a few statements to provide the parameters required for an EVPN core fabric with interfaces that connect to multihomed or single-homed end devices.

When you commit the configuration, the device accesses a commit script. The commit script uses the parameters from the [edit services evpn] statements to generate an EVPN fabric configuration that includes:

- Underlay and overlay peering configuration
- EVPN instance configuration (using MAC-VRF instances)
- Interfaces configuration for the ESI LAGs and IRB interfaces
- Host VLAN configuration
- Virtual routing and forwarding (VRF) routing instance, routing options, and policy options configurations
- Additional feature configuration such as:
  - Lightweight leaf to server loop detection
  - DHCP Relay
  - Storm control

The commit script generates a prescribed default EVPN fabric configuration. For mandatory EVPN fabric elements, the commit script uses default values or requires you to specify values for which it doesn't have prescribed defaults. For other elements, the commit script uses default algorithms to derive the values from the configured statements.

For some elements, you can choose to override generating configuration statements for those elements, and omit them or manually configure them instead. You can also add other standard EVPN fabric statements to the configuration manually as needed.

Options

defaults-override Select options to skip statements that the commit script would otherwise include by default when it generates the configuration:

- `no-aggregate-device-count-config`—Don't derive and include the aggregated Ethernet interface count in the generated configuration. You must manually configure the `set chassis aggregated-devices ethernet device-count` *num* statement on each peer PE device.

- `no-loop-detect-config`—Don't derive and add statements for the lightweight loop detection feature in the generated configuration. You can optionally configure loop detection manually.

- `no-platform-defaults-config`—Don't add the default statements for platform-specific options in the generated configuration. You must configure any required platform-specific statements manually.

- `no-policy-and-routing-options-config`—Don't derive and include the default routing options and policy options in the generated configuration.

  If you set this option, you must configure either of the following:

  - A routing policy with the name EXPORT-LO0 using `set policy-options policy-statement` commands. By default, when generating the EBGP peering configuration on a peer PE device, the commit script applies a policy with that name to advertise the device loopback interface to the device's neighbors.

  - The `no-underlay-config` option at the `[edit services evpn defaults-override]` hierarchy level to override the default behavior to generate the underlay peering configuration. In that case, you must manually configure the statements you need to set up the underlay peering.

- `no-storm-control-config`—Don't derive and include the storm control configuration elements. You can optionally configure storm control manually.

- `no-underlay-config`—Don't derive and add the underlay peering statements in the generated configuration. if you specify this override option, you must manually include the underlay peering configuration you need.

The remaining statements are explained in detail on separate pages.

You can also consult CLI Explorer.

Description

Accept and process only (S,G) reports for source-specific multicast (SSM) groups when:

- You configure Internet Group Management Protocol (IGMP) snooping for IGMP version 3 (IGMPv3) with IPv4 multicast traffic in an EVPN network.
- You configure Multicast Listener Discovery (MLD) snooping for MLD version 2 (MLDv2) with IPv6 multicast traffic in an EVPN network.

Devices use IGMP and MLD to discover and indicate interest in multicast groups. IGMP or MLD snooping restricts the forwarding of multicast traffic to only those interfaces in a bridge domain (VLAN) that have interested listeners.

By default, when IGMP snooping or MLD snooping is enabled, the device accepts and processes (*,G) (any-source multicast [ASM]) reports for:

- IGMP version 2 (IGMPv2)
- IGMPv3
- MLD version 1 (MLDv1)
- MLDv2

IGMPv3 and MLDv2 also support (S,G) source-specific multicast (SSM) reports and queries, but we don't support accepting and processing both (*,G) and (S,G) reports at the same time.

When you enable the `evpn-ssm-reports-only` option with IGMP snooping or MLD snooping, the device honors only IGMPv3 or MLDv2 (S,G) reports. The device drops any (*,G) reports for IGMPv2, IGMPv3, MLDv1, or MLDv2.

   }
   reroute-address {
       inet address;
       inet6 address;
   }
   shared-tunnels;
   vxlan-trans-vni-enable;
}
```

Hierarchy Level

```
[edit forwarding-options],
[edit logical-systems name routing-instances name forwarding-options]
```

Description

Set various global or per-routing-instance options in an EVPN-VXLAN fabric.

Options

gbp ingress-enforcement	Configure Group Based Policy (GBP) policy enforcement at the ingress node.
gbp ingress-src-tag filter *<gbp-filter>*	Associate the specified *<gbp-filter>* with the routing instance.

Use this option to enable EVPN Type 5 tag propagation, which is the ability to pass a source GBP tag within the extended BGP communities string of an EVPN Type 5 advertisement. By propagating the source GBP tag across the network, remote endpoints gain the information necessary to enforce GBP policies at their ingress.

The specified *<gbp-filter>* must be an IP-based (IP address or IP prefix) GBP filter.

This option has no effect if the specified *<gbp-filter>* is not an IP-based filter.

gbp mac-ip-inter-tagging

Allow MAC-based GBP filters and IP-based GBP filters to apply to both routed and switched traffic.

If disabled, then MAC-based GBP filters apply only to switched traffic, and IP-based GBP filters apply only to routed traffic.

This setting has no effect on other GBP filters, such as port and VLAN GBP filters.

> **NOTE**: The Packet Forwarding Engine (PFE) restarts when you set or delete this option.

gbp tag-only-policy

Allow only GBP source and destination tags as matches in GBP policy.

Configuring the IPv4 and IPv6 L4 filters can reduce the supported GBP scale. These matches are supported by default. However, on the EX4650 series, QFX5120-32C, and QFX5120-48Y switches, you can use this option to allow only GBP source and destination tags as matches in GBP policy.

> **NOTE**: The Packet Forwarding Engine (PFE) restarts when you set or delete this option.

host-originated-packets gbp-src-tag *gbp-src-tag*

Insert the specified GBP source tag in all host originated packets.

Range for *gbp-src-tag*: 1 through 65535.

reroute-address (inet *address* | inet6 *address*)

Enable fast reroute egress link protection (ELP) on provider edge (PE) devices for access links to multihomed customer edge (CE) devices in an EVPN-VXLAN fabric. With this statement, you also specify the IPv4 or IPv6 device reroute address, which is a secondary loopback address you configure as the fast reroute ELP tunnel source VTEP address for an Ethernet segment.

This feature helps to minimize load-balanced traffic loss when the link from a PE device to a multihomed CE device goes down.

shared-tunnels Create shared VXLAN tunnel endpoint (VTEP) tunnels to EVPN provider edge (PE) devices to save VTEP resources.

> **NOTE**: When you configure the `shared-tunnels` option, you must reboot the device for the setting to take effect.

vxlan-trans-vni-enable Enable translated VXLAN network identifiers (VNIs) with Data Center Interconnect (DCI).

> **NOTE**: We require this option on QFX5120 switches when you configure EVPN-VXLAN stitching with EVPN Type 2 routes in DCI topologies.
>
> The PFE restarts when you set or delete this option.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

  }
}
```

Hierarchy Level

```
[edit services evpn]
```

Description

Specify parameters the device uses to generate an Ethernet VPN (EVPN) fabric configuration with Virtual Extensible LAN (VXLAN) encapsulation.

You use the statements in the `[edit services evpn]` hierarchy level to simplify configuring an EVPN fabric with Ethernet segment identifier (ESI) link aggregation groups (LAGs) in the topology. The feature you enable with statements in this hierarchy is an easy EVPN LAG configuration feature, also called EZ-LAG.

You only need to configure a few statements to provide the parameters required for an EVPN core fabric with multihomed or single-homed customer edge (CE) devices (or end server devices). When you commit the `[edit services evpn]` configuration statements, the device uses a commit script to generate the corresponding standard EVPN fabric configuration statements.

The statements at the `evpn-vxlan` hierarchy level provide the parameters the commit script needs to generate the required EVPN-VXLAN configuration.

The statements at this hierarchy level are explained in detail on separate pages.

You can also see CLI Explorer.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

- Default | 6562
- Required Privilege Level | 6562
- Release Information | 6562

Syntax

```
(examine-dhcp | no-examine-dhcp) {
    forwarding-class class-name;
}
```

Hierarchy Level

```
[edit ethernet-switching-options secure-access-port vlan (all | vlan-name)]
```

Description

Enable DHCP snooping on all VLANs or on the specified VLAN.

> **NOTE**: If you configure DHCP for all VLANs and you enable a different port security feature on a specific VLAN, you must also explicitly enable DHCP snooping on that VLAN. Otherwise, the default value of no DHCP snooping applies to that VLAN.

- **examine-dhcp**—Enable DHCP snooping.
- **no-examine-dhcp**—Disable DHCP snooping.

When DHCP snooping is enabled, the switch logs DHCP packets (DHCPOFFER, DHCPDECLINE, DHCPACK, and DHCPNAK packets) that it receives on untrusted ports. You can monitor the log for these messages, which can signal the presence of a malicious DHCP server on the network.

> **TIP**: For private VLANs (PVLANs), enable DHCP snooping on the primary VLAN. If you enable DHCP snooping only on a community VLAN, DHCP messages coming from PVLAN trunk ports are not snooped.

The remaining statement is explained separately.

Default

Disabled.

Required Privilege Level

Syntax

```
examine-fip {
    examine-vn2vn {
        beacon-period milliseconds;
    }
    fc-map fc-map-value;
    no-fip-snooping-scaling;
}
```

Hierarchy Level

```
[edit ethernet-switching-options secure-access-port vlan (all | vlan-name)]
```

Description

NOTE: This statement supports the original CLI. If your switch runs the Enhanced Layer 2 Software (ELS) CLI, see "examine-vn2vf" on page 6566 for VN_Port to VF_Port (VN2VF_Port) FIP snooping, and see "examine-vn2vn" on page 6568 for VN_Port to VN_Port (VN2VN_Port) FIP snooping. For ELS details, see Using the Enhanced Layer 2 Software CLI.

Enable FIP snooping on a specified VLAN. Ensure that the VLAN is a dedicated FCoE VLAN that transports only FCoE traffic.

(QFX Series only) Enable VN2VN_Port FIP snooping on the specified VLAN. The VLAN must be a dedicated FCoE VLAN that transports only VN2VN_Port traffic. One FCoE VLAN cannot support both VN2VF_Port FIP snooping and VN2VN_Port FIP snooping. Configure separate, dedicated FCoE VLANs for VN2VN_Port FIP snooping and VN2VN_Port FIP snooping.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.4.

Statement `examine-vn2vn` introduced in Junos OS Release 12.2 for the QFX Series.

excess-bandwidth-share

IN THIS SECTION

- Syntax | 6577
- Hierarchy Level | 6577
- Description | 6577
- Options | 6578
- Required Privilege Level | 6578
- Release Information | 6578

Syntax

```
excess-bandwidth-share (proportional value | equal);
```

Hierarchy Level

```
[edit class-of-service interfaces interface-set interface-set-name]
```

Description

Specify the method of sharing excess bandwidth in a hierarchical scheduler environment. With hierarchical schedulers, you can provide shaping and scheduling at the service VLAN level as well as other levels, such as the physical interface. You can also group a set of logical interfaces and then apply scheduling and shaping parameters to the logical interface set.

To configure CoS hierarchical schedulers, you must enable hierarchical scheduling by including the `hierarchical-scheduler` statement at the `[edit interfaces]` hierarchy for the physical interface. If you do not include this statement, the interfaces on the MX Series router cannot use hierarchical interfaces.

The Enhanced Queuing DPC supports the following hierarchical scheduler characteristics:

- Shaping at the physical interface level
- Shaping and scheduling at the service VLAN interface set level

- Shaping and scheduling at the customer VLAN *logical interface* level
- Scheduling at the queue level

Options

equal Share excess bandwidth equally among the configured interfaces.

proportional *value* (Default) Share excess bandwidth proportionally according to the specified value. In this mode, the excess bandwidth is shared at the ratio of the logical interface shaping rates.

- **Default:** 32.64 Mbps

This example sets the excess bandwidth sharing for an Enhanced Queuing DPC interface proportionally at a rate of 100 Mbps and a shaping rate of 80 Mbps applied to the interface through the output-traffic-control profile for scheduling and shaping:

```
[edit class-of-service interfaces interface-set example-interface-set]
user@host# set excess-bandwidth-share proportional 100m
user@host# set output-traffic-control-profile PIR-80Mbps
```

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

excess-burst-size (QFX)

IN THIS SECTION

- Syntax | 6579
- Hierarchy Level | 6579
- Description | 6579
- Options | 6579
- Required Privilege Level | 6580
- Release Information | 6580

Syntax

```
excess-burst-size bytes;
```

Hierarchy Level

```
[edit firewall three-color-policer policer-name single-rate]
```

Description

Configure the maximum number of bytes allowed for incoming traffic to burst above the committed information rate and still be marked with medium-high packet loss priority (yellow). Packets that exceed the excess burst size (EBS) are marked with high packet loss priority (red).

> **NOTE**: When you include the `excess-burst-size` statement in the configuration, you must also include the **committed-burst-size** and `committed-information-rate` statements at the same hierarchy level.

Options

bytes—Number of bytes. You can specify a value in bytes either as a complete decimal number or as a decimal number followed by the abbreviation **k** (1000), **m** (1,000,000), or **g** (1,000,000,000).

- **Range:** 512 bytes through 268435456 bytes (268 MB)

Required Privilege Level

firewall—To view this statement in the configuration.

firewall-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.1.

Overview of Policers

excess-burst-size

IN THIS SECTION

- Syntax | 6580
- Hierarchy Level | 6581
- Description | 6581
- Options | 6581
- Required Privilege Level | 6582
- Release Information | 6582

Syntax

```
excess-burst-size bytes;
```

Hierarchy Level

```
[edit dynamic-profiles profile-name firewall three-color-policer name single-rate],
[edit firewall three-color-policer policer-name single-rate]
```

Description

For a single-rate three-color policer, configure the excess burst size (EBS) as a number of bytes. The EBS allows for moderate periods of bursting traffic that exceeds both the committed information rate (CIR) and the committed burst size (CBS).

> **NOTE**: When you include the `excess-burst-size` statement in the configuration, you must also include the `committed-burst-size` and `committed-information-rate` statements at the same hierarchy level.

Traffic that exceeds both the CIR and the CBS is considered nonconforming.

Single-rate three-color policing uses a *dual token bucket algorithm* to measure traffic against a single rate limit. Nonconforming traffic is categorized as yellow or red based on the `excess-burst-size` statement included in the policer configuration.

During periods of traffic that conforms to the CIR, any unused portion of the guaranteed bandwidth capacity accumulates in the first token bucket, up to the maximum number of bytes defined by the CBS. If any accumulated bandwidth capacity overflows the first bucket, the excess accumulates in a second token bucket, up to the maximum number of bytes defined by the EBS.

A nonconforming traffic flow is categorized yellow if its size conforms to bandwidth capacity accumulated in the first token bucket. Packets in a yellow flow are marked with `medium-high` packet loss priority (PLP) and then passed through the interface.

A nonconforming traffic flow is categorized red if its size exceeds the bandwidth capacity accumulated in the second token bucket. Packets in a red traffic flow are marked with `high` PLP and then either passed through the interface or optionally discarded.

Options

bytes—Number of bytes. You can specify a value in bytes either as a complete decimal number or as a decimal number followed by the abbreviation `k` (1000), `m` (1,000,000), or `g` (1,000,000,000).

- **Range:** 1500 through 100,000,000,000 bytes

Required Privilege Level

firewall—To view this statement in the configuration.

firewall-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 7.4.

Support at the `[edit dynamic-profiles ... single-rate]` hierarchy level introduced in Junos Release OS 11.4.

- Release Information | 6583

Syntax

```
excess-priority [ low | medium-low | medium-high | high | none];
```

Hierarchy Level

```
[edit class-of-service schedulers scheduler-name]
```

Description

Determine the priority of excess bandwidth traffic on a scheduler.

> **NOTE**: For Link Services IQ (LSQ) PICs or Multiservices PIC (MS-PICs), the `excess-priority` statement is allowed for consistency, but ignored. If an explicit priority is not configured for these interfaces, a default low priority is used. This default priority is also used in the excess region.

Options

`low`—Excess traffic for this scheduler has low priority.

`medium-low`—Excess traffic for this scheduler has medium-low priority.

`medium-high`—Excess traffic for this scheduler has medium-high priority.

`high`—Excess traffic for this scheduler has high priority.

`none`—System does not demote the priority of guaranteed traffic when the bandwidth exceeds the shaping rate or the guaranteed rate.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.3.

Option `none` introduced in Junos OS Release 11.4.

- Release Information | 6587

Syntax

```
excess-rate (percent percentage | proportion value);
```

Hierarchy Level

```
[edit class-of-service schedulers scheduler-name],
[edit class-of-service traffic-control-profiles traffic-control-profile-name]
```

Description

Determine the percentage of excess port bandwidth for which a queue (forwarding class) that is not a strict-high priority queue or forwarding class set (priority group) can contend. Excess bandwidth is the extra port bandwidth left after strict-high priority queues and the guaranteed minimum bandwidth requirements of other queues (as determined by each queue's transmit rate) are satisfied. With the exception of strict-high priority queues, the switch allocates extra port bandwidth to queues or to priority groups based on the configured excess rate. If you do not configure an excess rate for a queue, the default excess rate is the same as the transmit rate.

You cannot configure an excess rate on strict-high priority queues. Strict-high priority queues receive extra bandwidth based on an extra bandwidth sharing weight of "1", which is not configurable. However, the switch serves traffic on strict-high priority queues up to the configured transmit rate before it serves any other queues, so by configuring an appropriate transmit rate on a strict-high priority queue, you can guarantee strict-high priority traffic on that queue is treated in the manner you want.

> **NOTE**: For platforms that support the `proportion` option, this option provides a greater range of values over the `percent` option and hence influences the priorities assigned to the queues.

Options

percentage—Percentage of the excess bandwidth to share.

- **Range:** 0 through 100 percent
- **Default:** Excess bandwidth is shared in proportion to the configured transmit rate of each queue.

value—Proportion of the excess bandwidth to share.

- **Range:** 0 through 1000

> **NOTE**: Configure MPCs with increments of 10 from 0 through 1000.

Required Privilege Level

exclude (Dynamic MLD Interface)

IN THIS SECTION

- Syntax | 6604
- Hierarchy Level | 6604
- Description | 6604
- Required Privilege Level | 6604
- Release Information | 6604

Syntax

```
exclude;
```

Hierarchy Level

```
[edit dynamic-profiles profile-name protocols mld interface interface-name static group multicast-group-address]
```

Description

Configure the group to operate in exclude mode on the dynamic interface. In exclude mode all sources except the address configured are accepted for the group. By default, the group operates in include mode.

Required Privilege Level

view-level—To view this statement in the configuration.

control-level—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.1.

RELATED DOCUMENTATION

Dynamic MLD Configuration Overview

Enabling MLD Static Group Membership

exclude (for Administrative Groups)

IN THIS SECTION

- Syntax | 6605
- Hierarchy Level | 6605
- Description | 6605
- Options | 6606
- Required Privilege Level | 6606
- Release Information | 6606

Syntax

```
exclude [ group-names ];
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols mpls label-switched-path lsp-name admin-group],
[edit logical-systems logical-system-name protocols mpls label-switched-path lsp-name (primary |
secondary) path-name admin-group],
[edit protocols mpls label-switched-path lsp-name admin-group],
[edit protocols mpls label-switched-path lsp-name (primary | secondary) path-name admin-group]
```

Description

Define the administrative groups to exclude for an LSP or for a path's primary and secondary paths.

Options

group-names—Names of one or more groups defined with the "admin-groups" on page 1973 statement.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

RELATED DOCUMENTATION

Configuring Administrative Groups for LSPs

exclude (for Fast Reroute)

IN THIS SECTION

- Syntax | 6606
- Hierarchy Level | 6607
- Description | 6607
- Options | 6607
- Required Privilege Level | 6607
- Release Information | 6607

Syntax

```
(exclude [ group-names ] | no-exclude);
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols mpls label-switched-path lsp-name fast-reroute],
[edit protocols mpls label-switched-path lsp-name fast-reroute]
```

Description

Control exclusion of administrative groups:

- `exclude`—Define the administrative groups to exclude for fast reroute.
- `no-exclude`—Disable administrative group exclusion.

Options

`group-names`—Names of one or more groups defined with the `admin-groups` statement.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

- Description | 6608
- Required Privilege Level | 6608
- Release Information | 6608

Syntax

```
exclude-hostname;
```

Hierarchy Level

```
[edit system syslog host hostname]
```

Description

Disable logging of hostname in the message directed to remote host.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2

exclude (JSRC Attributes)

IN THIS SECTION

- Syntax | 6609
- Hierarchy Level | 6609
- Description | 6609
- Options | 6609
- Required Privilege Level | 6610
- Release Information | 6610

Syntax

```
exclude {
    user-name [ authorization-request | provisioning-request ];
}
```

Hierarchy Level

```
[edit access profile profile-name jsrc attributes]
```

Description

Configure the router to exclude the specified attribute-value pair (AVP) from the specified Diameter message for JSRC.

Options

- `user-name`—User-Name AVP (1). Diameter AVP name and number.
- `authorization-request`—address-authorization request in AAR message sent from JSRC to the SAE.
- `provisioning-request`—provisioning-request in AAR message sent from JSRC to the SAE.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.2.

- Release Information | 6611

Syntax

```
exclude-protocol protocol-name;
```

Hierarchy Level

```
[edit security macsec connectivity-association connectivity-association-name]
```

Description

Specifies protocols whose packets are not secured using Media Access Control Security (MACsec) when MACsec is enabled on a link using static connectivity association key (CAK) security mode.

When this option is enabled in a connectivity association that is attached to an interface, MACsec is not enabled for all packets of the specified protocols that are sent and received on the link.

Default

Disabled.

All packets are secured on a link when MACsec is enabled, with the exception of all types of Spanning Tree Protocol (STP) packets.

Options

protocol-name Specifies the name of the protocol that should not be MACsec-secured. Options include:

- **cdp**—Cisco Discovery Protocol.
- **lacp**—Link Aggregation Control Protocol.
- **lldp**—Link Level Discovery Protocol.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

```

Hierarchy Level

```
[edit access profile profile-name radius attributes]
```

Description

Configure the router or switch to exclude the specified attributes from being sent in the specified type of RADIUS message. Exclusion can be useful, for example, for attributes that do not change values over the lifetime of a subscriber. By not sending these attributes, you reduce the packet size without losing information. Contrast this behavior with that provided by the `ignore` statement.

You can specify attribute exclusion for multiple RADIUS message types by enclosing the message types, separated by spaces, within brackets ([ ]). You do not need brackets when specifying a single message type.

Starting in Junos OS Release 18.1R1, you can specify standard RADIUS attributes with the attribute number. You can specify VSAs with the IANA-assigned vendor ID and the VSA number. With this flexible configuration method, you can configure any standard attribute and VSA supported by your platform to be excluded. The configuration has no effect if you configure unsupported attributes, vendors, and VSAs.

The legacy method allows you to configure only those attributes and VSAs for which the statement syntax includes a specific option. Consequently, you can use the legacy method to exclude only a subset of all attributes that can be received in Access-Accept messages.

Not all attributes are available in all types of RADIUS messages.

NOTE: If you exclude an attribute from Acct-Off messages, the attributes are then excluded from Interim-Acct messages.

NOTE: VSAs with dedicated option names include Juniper Networks (IANA vendor ID 4874) and DSL Forum (vendor ID 3561) VSAs.

Options

RADIUS attribute—RADIUS standard attribute or VSA:

- `acc-aggr-cir-id-asc`—Exclude Juniper Networks VSA 26-112, Acc-Aggr-Cir-Id-Asc.
- `acc-aggr-cir-id-bin`—Exclude Juniper Networks VSA 26-111, Acc-Aggr-Cir-Id-Bin.
- `acc-loop-cir-id`—Exclude Juniper Networks VSA 26-110, Acc-Loop-Cir-Id.
- `acc-loop-encap`—Exclude Juniper Networks VSA 26-183, Acc-Loop-Encap.
- `acc-loop-remote-id`—Exclude Juniper Networks VSA 26-182, Acc-Loop-Remote-Id.
- `accounting-authentic`—Exclude RADIUS attribute 45, Acct-Authentic.
- `accounting-delay-time`—Exclude RADIUS attribute 41, Acct-Delay-Time.
- `accounting-session-id`—Exclude RADIUS attribute 44, Acct-Session-Id.
- `accounting-terminate-cause`—Exclude RADIUS attribute 49, Acct-Terminate-Cause.
- `acct-request-reason`—Exclude Juniper Networks VSA 26-210, Acct-Request-Reason.
- `acct-tunnel-connection`—Exclude RADIUS attribute 68, Acct-Tunnel-Connection.
- `act-data-rate-dn`—Exclude Juniper Networks VSA 26-114, Act-Data-Rate-Dn.

- `act-data-rate-up`—Exclude Juniper Networks VSA 26-113, Act-Data-Rate-Up.
- `act-interlv-delay-dn`—Exclude Juniper Networks VSA 26-126, Act-Interlv-Delay-Dn.
- `act-interlv-delay-up`—Exclude Juniper Networks VSA 26-124, Act-Interlv-Delay-Up.
- `att-data-rate-dn`—Exclude Juniper Networks VSA 26-118, Att-Data-Rate-Dn.
- `att-data-rate-up`—Exclude Juniper Networks VSA 26-117, Att-Data-Rate-Up.
- `called-station-id`—Exclude RADIUS attribute 30, Called-Station-Id.
- `calling-station-id`—Exclude RADIUS attribute 31, Calling-Station-Id.
- `chargeable-user-identity`—Exclude RADIUS attribute 89, Chargeable-User-Identity.
- `class`—Exclude RADIUS attribute 25, Class.
- `cos-shaping-rate`—Exclude Juniper Networks VSA 26-177, Cos-Shaping-Rate.
- `delegated-ipv6-prefix`—Exclude RADIUS attribute 123, Delegated-IPv6-Prefix.
- `dhcp-gi-address`—Exclude Juniper Networks VSA 26-57, DHCP-GI-Address.
- `dhcp-header`—Exclude Juniper Networks VSA 26-208, DHCP-Header.
- `dhcp-mac-address`—Exclude Juniper Networks VSA 26-56, DHCP-MAC-Address.
- `dhcp-options`—Exclude Juniper Networks VSA 26-55, DHCP-Options.
- `dhcpv6-header`—Exclude Juniper Networks VSA 26-209, DHCPv6-Header.
- `dhcpv6-options`—Exclude Juniper Networks VSA 26-207, DHCPv6-Options.
- `dynamic-iflset-name`—Exclude Juniper Networks VSA 26-130, Qos-Set-Name.
- `downstream-calculated-qos-rate`—Exclude Juniper Networks VSA 26-141.
- `dsl-forum-attributes`—Exclude DSL Forum VSA (vendor ID 3561) as described in RFC 4679, *DSL Forum Vendor-Specific RADIUS Attributes*.
- `dsl-line-state`—Exclude Juniper Networks VSA 26-127, DSL-Line-State.
- `dsl-type`—Exclude Juniper Networks VSA 26-128, DSL-Type.
- `event-timestamp`—Exclude RADIUS attribute 55, Event-Timestamp.
- `filter-id`—Exclude RADIUS attribute 11, Filter-Id.
- `first-relay-ipv4-address` —Exclude Juniper Networks VSA 26-189, DHCP-First-Relay-IPv4-Address.

- `first-relay-ipv6-address` —Exclude Juniper Networks VSA 26-190, DHCP-First-Relay-IPv6-Address.
- `framed-interface-id`—Exclude RADIUS attribute 96, Framed-Interface-ID.
- `framed-ip-address`—Exclude RADIUS attribute 8, Framed-IP-Address.
- `framed-ip-netmask`—Exclude RADIUS attribute 9, Framed-IP-Netmask.
- `framed-ip-route`—Exclude RADIUS attribute 22, Framed-Route.
- `framed-ipv6-address`—Exclude RADIUS attribute 168, Framed-IPv6-Address.
- `framed-ipv6-pool`—Exclude RADIUS attribute 100, Framed-IPv6-Pool.
- `framed-ipv6-prefix`—Exclude RADIUS attribute 97, Framed-IPv6-Prefix.
- `framed-ipv6-route`—Exclude RADIUS attribute 99, Framed-IPv6-Route.
- `framed-pool`—Exclude RADIUS attribute 88, Framed-Pool.
- `input-filter`—Exclude Juniper Networks VSA 26-10, Ingress-Policy-Name.
- `input-gigapackets`—Exclude Juniper Networks VSA 26-42, Acct-Input-Gigapackets.
- `input-gigawords`—Exclude RADIUS attribute 52, Acct-Input-Gigawords.
- `input-ipv6-gigawords`—Exclude Juniper Networks VSA 26-155, Acct-Input-IPv6-Gigawords.
- `input-ipv6-octets`—Exclude Juniper Networks VSA 26-151, Acct-Input-IPv6-Octets.
- `input-ipv6-packets`—Exclude Juniper Networks VSA 26-153, Acct-Input-IPv6-Packets.
- `interface-description`—Exclude Juniper Networks VSA 26-53, Interface-Desc.
- `l2c-downstream-data`—Exclude Juniper Networks VSA 26-93, L2C-Down-Stream-Data.
- `l2c-upstream-data`—Exclude Juniper Networks VSA 26-92, L2C-Up-Stream-Data.
- `l2tp-rx-connect-speed`—Exclude Juniper Networks VSA 26-163, Rx-Connect-Speed.
- `l2tp-tx-connect-speed`—Exclude Juniper Networks VSA 26-162, Tx-Connect-Speed.
- `max-data-rate-dn`—Exclude Juniper Networks VSA 26-120, Max-Data-Rate-Dn.
- `max-data-rate-up`—Exclude Juniper Networks VSA 26-119, Max-Data-Rate-Up.
- `max-interlv-delay-dn`—Exclude Juniper Networks VSA 26-125, Max-Interlv-Delay-Dn.
- `max-interlv-delay-up`—Exclude Juniper Networks VSA 26-123, Max-Interlv-Delay-Up.
- `min-data-rate-dn`—Exclude Juniper Networks VSA 26-116, Min-Data-Rate-Dn.

- `min-data-rate-up`—Exclude Juniper Networks VSA 26-115, Min-Data-Rate-Up.
- `min-lp-data-rate-dn`—Exclude Juniper Networks VSA 26-122, Min-Lp-Data-Rate-Dn.
- `min-lp-data-rate-up`—Exclude Juniper Networks VSA 26-121, Min-Lp-Data-Rate-Up.
- `nas-identifier`—Exclude RADIUS attribute 32, NAS-Identifier.
- `nas-port`—Exclude RADIUS attribute 5, NAS-Port.
- `nas-port-id`—Exclude RADIUS attribute 87, NAS-Port-Id.
- `nas-port-type`—Exclude RADIUS attribute 61, NAS-Port-Type.
- `output-filter`—Exclude Juniper Networks VSA 26-11, Egress-Policy-Name.
- `output-gigapackets`—Exclude Juniper Networks VSA 26-43, Acct-Output-Gigapackets.
- `output-gigawords`—Exclude RADIUS attribute 53, Acct-Output-Gigawords.
- `output-ipv6-gigawords`—Exclude Juniper Networks VSA 26-156, Acct-Output-IPv6-Gigawords.
- `output-ipv6-octets`—Exclude Juniper Networks VSA 26-152, Acct-Output-IPv6-Octets.
- `output-ipv6-packets`—Exclude Juniper Networks VSA 26-154, Acct-Output-IPv6-Packets.
- `packet-type`—Specify the RADIUS message type to exclude; term required when excluding a standard attribute or VSA by number rather than name. You can enclose multiple values in square brackets to specify a list of message types. Message types include Access-Request, Accounting-Off, Accounting-Off, Accounting-Start, and Accounting-Stop.
- `pppoe-description`—Exclude Juniper Networks VSA 26-24, PPPoE-Description.
- `standard-attribute` *`number`*—RADIUS standard attribute number supported by your platform. If you configure an unsupported attribute, that configuration has no effect. When you use this option, you must use the `packet-type` term to specify the message from which the attribute is excluded.
- `tunnel-assignment-id`—Exclude RADIUS attribute 82, Tunnel-Assignment-ID.
- `tunnel-client-auth-id`—Exclude RADIUS attribute 90. Tunnel-Client-Auth-ID.
- `tunnel-client-endpoint`—Exclude RADIUS attribute 66, Tunnel-Client-Endpoint.
- `tunnel-medium-type`—Exclude RADIUS attribute 65, Tunnel-Medium-Type.
- `tunnel-server-auth-id`—Exclude RADIUS attribute 91, Tunnel-Server-Auth-ID.
- `tunnel-server-endpoint`—Exclude RADIUS attribute 67, Tunnel-Server-Endpoint.
- `tunnel-type`—Exclude RADIUS attribute 64, Tunnel-Type.

- `upstream-calculated-qos-rate`—Exclude Juniper Networks VSA 26-142
- `vendor-attribute` *`vsa-number`*—Number identifying a VSA belonging to the specified vendor; both must be supported by your platform. If you configure an unsupported VSA, that configuration has no effect. When you use this option, you must use the `packet-type` term to specify the message from which the attribute is excluded.
- `vendor-id` *`id-number`*—IANA vendor ID supported by your platform. If you configure an unsupported vendor ID, that configuration has no effect.
- `virtual-router`—Exclude Juniper Networks VSA 26-1.

RADIUS message type:

- `access-request`—RADIUS Access-Request messages.
- `accounting-off`—RADIUS Accounting-Off messages.
- `accounting-on`—RADIUS Accounting-On messages.
- `accounting-start`—RADIUS Accounting-Start messages.
- `accounting-stop`—RADIUS Accounting-Stop messages.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.1.

`downstream-calculated-qos-rate`, `dsl-forum-attributes`, and `upstream-calculated-qos-rate` options added in Junos OS Release 11.4.

`cos-shaping-rate` and `filter-id` options added in Junos OS Release 13.2.

`pppoe-description` option added in Junos OS Release 14.2.

`virtual-router` option added in Junos OS Release 15.1.

`first-relay-ipv4-address` and `first-relay-ipv6-address` options added in Junos OS Release 16.1.

`acc-loop-encap` and `acc-loop-remote-id` options added in Junos OS Release 16.1R4.

`access-request` option support for all tunnel attributes added in Junos OS Release 15.1R7, 16.1R5, 16.2R2, 17.1R2, 17.2R2, and 17.3R1 for MX Series.

`packet-type`, `standard-attribute`, `vendor-attribute`, and `vendor-id` options added in Junos OS Release 18.1R1.

protection],
[edit protocols rsvp interface interface-name link-protection bypass destination],
[edit logical-systems logical-system-name protocols rsvp interface interface-name link-
protection bypass destination]
```

Description

Exclude Shared Risk Link Group (SRLG) links for the secondary path for critical links where it is imperative to keep the secondary and primary label-switched paths completely disjoint from any common SRLG.

When specified, the Constrained Shortest Path First (CSPF) algorithm excludes any link belonging to the set of SRLGs in the primary path. When not specified and if a link belongs to the set of SRLGs in the primary path, CSPF adds the SRLG cost to the metric, but still accepts the link for computing the path.

Required Privilege Level

- Release Information | 6632

Syntax

```
excluded-address ip-address;
```

Hierarchy Level

```
[edit access address assignment-address pool]
```

Description

Allows you to exclude select IPv4 or IPv6 addresses from a DHCP address pool. Within a configured address pool, you can specifically exclude up to 20 addresses. Junos OS will not assign these excluded addresses to any clients. If you configure an excluded address that has already been assigned to a DHCP client, that excluded address will be revoked from the client.

NOTE: Excluded addresses must match the address family of the configured address pool. For example, you cannot exclude an IPv4 address within an IPv6 address pool.

Required Privilege Level

access—To view this statement in the configuration.

access-control—To add this statement to the configuration.

- Required Privilege Level | 6633
- Release Information | 6633

Syntax

```
excluded-range name low minimum-value high maximum-value;
```

Hierarchy Level

```
[edit access address-assignment pool name family (inet | inet6)],
[edit logical-systems name access address-assignment pool name family (inet | inet6)],
[edit logical-systems name routing-instances name access address-assignment pool name family (inet
| inet6)],
[edit routing-instances name access address-assignment pool name family (inet | inet6)]
```

Description

Specify a range of consecutive addresses to exclude from consideration when addresses are allocated from the corresponding address pool. For example, you might want to reserve certain addresses or ranges to be used only for static subscribers. If a range you configure for exclusion includes an address that has already been allocated, the subscriber that has that address is logged out. The address is then deallocated and marked for exclusion from future allocation.

Options

high Upper limit of excluded range of addresses.

low Lower limit of range of addresses.

name Name of a range of addresses to exclude from the address pool for the specified family.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

exclusive-mac

IN THIS SECTION

- Syntax | 6634
- Hierarchy Level | 6634
- Description | 6634
- Options | 6635
- Required Privilege Level | 6635
- Release Information | 6635

Syntax

```
exclusive-mac virtual-mac-mac-address/mask;
```

Hierarchy Level

```
[edit protocols l2-learning global-mac-move]
```

Description

Exclude MAC addresses from the MAC move limit algorithm.

The global MAC move feature is used to track MAC addresses when they appear on a different physical interface or within a different unit of the same physical interface. When you configure the `exclusive-mac` *`virtual-mac-mac-address/mask`* parameter at the [`edit protocols l2-learning global-mac-move`] hierarchy level,

specified MAC addresses are excluded and will not be tracked. In addtion, excluded MAC addresses cannot be pinned when `mac-pinning` is set on an interface.

This feature can be useful in OVSDB-managed topologies with VRRP servers deployed in a redundancy configuration (primary/member), and when MAC move limit is configured. Both servers could negotiate primary role, and the same MAC address could be learned under the global MAC move feature while negotiation is occurring. In such cases, excluding the MAC address of the VRRP servers by using the `exclusive-mac` statement prevents this “false” move from being tracked.

The following example excludes VRRP V2 virtual router MAC addresses, as defined in RFC 3768:

```
[edit]
set protocols l2-learning global-mac-move exclusive-mac 00:00:5e:00:01:00/40
```

The following example excludes VRRP V3 virtual router MAC addresses, as defined in RFC 5798:

```
[edit]
set protocols l2-learning global-mac-move exclusive-mac 00:00:5e:00:02:00/40
```

Options

virtual-mac-mac-address/mask	Specify a MAC address and a mask. If the mask is 48, only the exact MAC address is excluded. If the mask is 40, all the MAC addresses that have the same first 5 bytes are excluded.

Required Privilege Level

[edit class-of-service system-defaults classifiers]
```

Description

Define the EXP code point mapping that is applied to MPLS packets. EXP classifiers are not applied to any traffic except MPLS traffic. EXP classifiers are applied only to interfaces that are configured as `family mpls` (for example, `set interfaces xe-0/0/35 unit 0 family mpls`.)

There are no default EXP classifiers. You can configure up to 64 EXP classifiers.

Starting in Junos OS 20.3R1, on segment routing LSPs, applying an EXP rewrite rule to the egress interface on the ingress (provider edge) router of a segment-routing network imposes the rewrite rule to all transport labels in the stack. As a result, you don't need to configure rewrite rules on every segment in the LSP.

On QFX10000 switches, you can configure and apply EXP classifiers to interfaces in the same way that you configure and apply DSCP, DSCP IPv6, and IEEE classifiers to interfaces. Different interfaces can have different EXP classifiers. QFX10000 switches do not support global EXP classifiers.

QFX5100 and EX4600 switches uses only one EXP classifier as a global MPLS classifier on all interfaces. You specify the global EXP classifier in the `[edit class-of-service system-defaults]` hierarchy.

EX Series switches support only one EXP code mapping on the switch (either default or custom). It is applied globally and implicitly to all the MPLS-enabled interfaces on the switch. You cannot bind it or disable it on individual interfaces.

Options

classifier-name—Name of the EXP classifier.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

Syntax

```
exp (rewrite-name | default) protocol protocol-types;
```

Hierarchy Level

```
[edit class-of-service interfaces interface-name unit logical-unit-number rewrite-rules]
```

Description

Apply an MPLS experimental (EXP) rewrite rule.

Starting in Junos OS 20.3R1, on segment routing LSPs, applying an EXP rewrite rule to the egress interface on the ingress (provider edge) router of a segment-routing network imposes the rewrite rule to all transport labels in the stack. As a result, you don't need to configure rewrite rules on every segment in the LSP.

Options

rewrite-name Name of a `rewrite-rules` mapping configured at the `[edit class-of-service rewrite-rules exp]` hierarchy level.

default The default mapping.

By default, IP precedence rewrite rules alter the first three bits on the type-of-service (ToS) byte while leaving the last three bits unchanged. This default behavior applies to rewrite rules you configure for MPLS packets with IPv4 payloads. You configure these types of rewrite rules by including the `mpls-inet-both` or `mpls-inet-both-non-vpn` option at the `[edit class-of-service interfaces interface interface-name unit logical-unit-number rewrite-rules exp rewrite-rule-name protocol]` hierarchy level. The IP precedence rewrite rules explanation does not apply to ACX Series Universal Metro routers.

On interfaces configured on Modular Port Concentrators (MPCs) and Modular Interface Cards (MICs) on MX Series 5G Universal Routing Platforms and EX Series switches, we highly recommend that you configure the `default` option when you configure a behavior aggregate (BA) classifier that does not include a specific rewrite rule for MPLS packets. Doing so ensures that MPLS exp value is rewritten according to the BA classifier rules configured for forwarding or packet loss priority. This does not apply to ACX Series Universal Metro routers.

protocol-types

Specify one or more protocol matching criteria:

- `mpls-any`—Apply to MPLS packets, write MPLS header only.
- `mpls-inet-both`—Apply to IPv4 MPLS packets, write MPLS and IPv4 header.
- `mpls-inet-both-non-vpn`—Apply to IPv4 MPLS packets, write MPLS and IPv4 header for only non VPN traffic.

> Junos OS Evolved supports only the `mpls-any` option. Devices running Junos OS Evolved do not support different rewrite rules for VPN and non-VPN traffic.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Description

Allow an LSP to traverse multiple OSPF areas within a service provider's network.

Allows a point-to-multipoint LSP to span multiple domains in a network. Effectively, this allows you to configure one or more sub-LSPs (branches) in separate network domains. Examples of such domains include OSPF areas and autonomous systems (ASs). A sub-LSP of an inter-domain point-to-multipoint LSP can be intra-area, inter-area, or inter-AS, depending on the location of the egress node (leaf) with respect to the ingress node (source). Only OSPF areas are supported for inter-domain point-to-multipoint LSPs. IS-IS levels are not supported.

Syntax

```
explicit-congestion-notification;
```

Hierarchy Level

```
[edit class-of-service schedulers scheduler-name]
```

Description

Enable explicit congestion notification (ECN) on the output queue (forwarding class) or output queues (forwarding classes) mapped to the scheduler. ECN enables end-to-end congestion notification between two endpoints on TCP/IP based networks. The two endpoints are an ECN-enabled sender and an ECN-enabled receiver. ECN must be enabled on both endpoints and on all of the intermediate devices between the endpoints for ECN to work properly. Any device in the transmission path that does not support ECN breaks the end-to-end ECN functionality.

A weighted random early detection (WRED) packet drop profile must be applied to the output queues on which ECN is enabled. ECN uses the WRED drop profile thresholds to mark packets when the output queue experiences congestion.

ECN reduces packet loss by forwarding ECN-capable packets during periods of network congestion instead of dropping those packets. (TCP notifies the network about congestion by dropping packets.) During periods of congestion, ECN marks ECN-capable packets that egress from congested queues. When the receiver receives an ECN packet that is marked as experiencing congestion, the receiver

echoes the congestion state back to the sender. The sender then reduces its transmission rate to clear the congestion.

export [ policy-names ];
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols isis],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols
isis],
[edit protocols isis],
[edit routing-instances routing-instance-name protocols isis]
```

Description

Apply one or more policies to routes being exported from the routing table into IS-IS.

All routing protocols store the routes that they learn in the routing table. The routing table uses this collected route information to determine the active routes to destinations. The routing table then installs the active routes into its forwarding table and exports them into the routing protocols. It is these exported routes that the protocols advertise.

For each protocol, you control which routes the protocol stores in the routing table and which routes the routing table exports into the protocol from the routing table by defining a *routing policy* for that protocol.

> **NOTE**: For IS-IS, you cannot apply routing policies that affect how routes are imported into the routing table; doing so with a link-state protocol can easily lead to an inconsistent topology database.

Options

policy-names—Name of one or more policies.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

export (RIP)

IN THIS SECTION

- Syntax | **6662**
- Hierarchy Level | **6662**
- Description | **6662**

- Options | 6662
- Required Privilege Level | 6663
- Release Information | 6663

Syntax

```
export [ policy-names ];
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols rip group group-name],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols rip
group group-name],
[edit protocols rip group group-name],
[edit routing-instances routing-instance-name protocols rip group group-name]
```

Description

Apply a policy to routes being exported to the neighbors.

By default, RIP does not export routes it has learned to its neighbors. To enable RIP to export routes, apply one or more export policies.

If no routes match the policies, the local routing device does not export any routes to its neighbors. Export policies override any metric values determined through calculations involving the values configured with the `metric-in` and `metric-out` statements.

> **NOTE**: The export policy on RIP does not support manipulating routing information of the next hop.

Options

policy-names—Name of one or more policies.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

export-format (JSON)

IN THIS SECTION

- Syntax | 6665
- Hierarchy Level | 6665
- Description | 6665
- Options | 6666
- Required Privilege Level | 6666
- Release Information | 6666

Syntax

```
export-format {
    json {
        ietf;
        verbose;
    }
    state-data {
        json {
            compact;
        }
    }
}
```

Hierarchy Level

```
[edit system]
```

Description

Specify the default implementation of the serialization to use for exported data in the given format. This statement affects configuration data and command output that is displayed in the requested format.

Options

json Define which implementation of the serialization to use for configuration data emitted in JavaScript Object Notation (JSON) format.

Acceptable values include:

- `ietf`—Emit JSON data according to the encoding rules defined in Internet drafts draft-ietf-netmod-yang-json-09, *JSON Encoding of Data Modeled with YANG*, and draft-ietf-netmod-yang-metadata-06, *Defining and Using Metadata with YANG*.
- `verbose`—Emit JSON data in verbose format, which emits all objects as JSON arrays.

  You can configure the `verbose` statement starting in Junos OS Release 16.1R1, even though the statement is not exposed in the Junos OS CLI until a later release.
- **Default:** `ietf` in Junos OS Release 16.1R1 and later; `verbose` in earlier releases.

state-data Specify the format for emitting state data.

- `json compact`—Emit JSON-formatted state data in compact format where only the objects that have multiple values are emitted as JSON arrays. Junos devices, by default, emit state data in non-compact format, which emits all objects as JSON arrays.

  This statement is deprecated starting in Junos OS Release 24.4R1 and Junos OS Evolved Release 24.4R1

Required Privilege Level

maintenance—To view or add this statement in the configuration.

Release Information

Statement introduced in Junos OS Release 16.1.

`state-data json compact` statement added in Junos OS Release 17.3R1.

`state-data json compact` statement deprecated in Junos OS Release 24.4R1 and Junos OS Evolved Release 24.4R1.

export-profile (Junos Telemetry Interface)

IN THIS SECTION

- Syntax | **6670**
- Hierarchy Level | **6670**

- Description | 6670
- Options | 6671
- Required Privilege Level | 6673
- Release Information | 6673

Syntax

```
export-profile name {
    dscp value;
    format file-format;
    forwarding-class (assured-forwarding |  best-effort |  expedited-forwarding  | network-
control);
    local-address ip-address;
    local-port source-port-number;
    loss-priority (high | low | medium-high | medium-low);
    <payload-size bytes>;
    reporting-rate seconds;
    transport protocol-name;
    routing-instance routing-instance-name
}
```

Hierarchy Level

```
[edit services analytics]
```

Description

Configure the parameters of the export process for data generated through Junos Telemetry Interface sensors. You can create one or more export profiles. Each profile can be associated with one or more sensors that define the system resource to monitor and stream data. You can associate only one export profile with a specific sensor configuration.

The IP layer delivers the exported data to the remote server. The export profile configuration allows you to specify a format for exported data, a transport protocol, the rate which the system generates data, and the local source port and IP address that are used to define the transport headers in the exported packets.

To enable Junos Telemetry Interface, you must also configure a sensor that defines the parameters of the system resource to monitor and stream data, and a server to collect the data. To configure a sensor, include the `sensor` *`sensor-name`* statement at the `[edit services analytics]` hierarchy level. To configure the server that functions as a data collector, include `streaming-server` *`server-name`* statement at the `[edit services analytics]` hierarchy level.

If you are configuring the export profile for dialout, the options `local-address`, `local-port`, `dscp`, `forwarding-class`, `loss-priority`, `payload-size`, and `resource-filter` are not supported. Only the `reporting-interval` option is supported with dialout.

> **NOTE**: Junos Telemetry Interface was introduced in Junos OS Release 15.1F3 on MX Series routers with interfaces configured on MPC1 through MPC6E and on PTX Series routers with interfaces configured on FPC3. Starting in Junos OS Release 15.1F5, Junos Telemetry Interface is also supported on MPC7E, MPC8E, and MPC9E on MX Series routers.
>
> Starting with Junos OS Release 16.1R3, FPC1 and FPC2 on PTX Series routers are also supported.
>
> Starting with Junos OS Release 17.2R1, QFX10000 switches and PTX1000 routers are also supported.

Options

name

Name of export profile.

> **NOTE**: To associate this export profile with a configured sensor, include the `name` you configure for the `export-profile` statement at the `[edit services analytics sensor` *`sensor-name`* `export-name]` hierarchy level.

dscp ***value***

Specify the DSCP value for the exported packets.

- **Range:** 0 through 63.
- **Default:** 0

> **NOTE**: Any interface-level DSCP rewrite rules you have configured override the DSCP value you specify for the export profile. You need to specify a DSCP value for the export profile only if you do not configure DSCP rewrite rules on the outgoing interface. For more information, see *Configuring Rewrite Rules*.

format

Specify the format to define the structure of exported data.

gpb Google protocol buffers format.

gpb-gnmi Google protocol buffers encoding support for (gRPC Network Management Interface) gNMI.

json-gnmi Javascript Object Notation (JSON) encoding support for gNMI.

forwarding-class (assured-forwarding | best-effort | expedited-forwarding | network-control)

(Packet Forwarding Engine sensors only) Specify the forwarding class for exported packets.

- **Default:** `best-effort`

loss-priority (high | low | medium-high | medium-low) (MX Series only)

Specify the loss priority for exported packets. Loss priority settings help determine which packets are dropped from the network during periods of congestion.

local-address *ip-address*

Specify the source address of exported packets.

local-port *number*

Specify the source port for the exported packets.

payload-size *bytes* (Optional)

Specify the maximum size of exported packets.

> **NOTE**: The `payload-size` option is supported only on the following sensors:
>
> - /junos/system/linecard/interface/
> - /junos/system/linecard/interface/logical/usage/
> - /junos/system/linecard/firewall/

- **Default:** 5000 bytes.
- **Range:** For the QFX5100 line of switches, 3000 through 9192 bytes. For Packet Forwarding Engine-related statistics (logical and physical interface and firewall statistics) on all platforms, 2000 through 9192. This is a platform limitation. For all other supported platforms, 1400 through 9192 bytes.

> **NOTE**: Junos Telemetry Interface does not export packets larger than 9192 bytes.

reporting-rate *seconds*

Specify the interval at which the Junos Telemetry Interface sensor generates data to export to the collector.

As the configured interval expires, the most recent sample collected by the sensor is gathered and forwarded to the server configured to collect data.

> **NOTE**: For Packet Forwarding Engine sensors, the minimum reporting rate is 2 seconds.

- **Range:** 1 through 3600 (1 hour)

transport *protocol-name*

Specify the transport protocol to use to carry the telemetry data in the IP packets.

udp User Datagram Protocol.

routing-instance *rounting-instance-name*

Specify the routing instance to be used for grpc transport.
The `routing-instance` configuration is for grpc dialout connections only. Configuring `routing-instance` is not mandatory. If it is not configured, the default routing instance is applied. If you specify a `routing-instance` which is not configured, commit fails and an error message is displayed. If `routing-instance` configuration is specified for UDP transport protocol, commit fails and an error message is displayed.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1F3.

`payload-size` *bytes* option introduced in Junos OS Release 16.1R3.

`loss-priority` option introduced in Junos OS Release 17.3R1 for MX Series routers only.

Statement introduced in Junos OS Release 17.4R1 for virtual MX Series (vMX) routers.

```

Description

Configure an profile to specify the network analytics data being streamed to remote servers. Each profile is a template that defines the type of data being streamed.

> **NOTE**: The `export-profile` statement is not available in Junos OS Releases prior to 13.2X51-D15.

Options

profile-name Name of the export profile containing the configuration of the data being streamed.

stream-format ***format*** Format of the streaming data being sent to a server. Only one format can be sent to each port on a server.

- Values:
  - **csv**—Comma-separated Values (CSV). Data sent in this format is newline separated, and each record contains one stream type (queue or traffic data) per interface.Each record contains either a “q” for a queue statistics, or a “t” for a traffic statistics.
  - **gpb**—Google Protocol Buffer (GPB). Data sent in this format has a hierachical format, and is categorized by resource type (system or interfaces), which is specified in the message header. You can generate data formatted in other formats (CSV, TSV, and JSON) from GPB-encoded data.

    Each message includes a 8-byte header containing the following information:

- Bytes 0 to 3—Length of the message.
- Byte 4—Message version.
- Bytes 5 to 7—Reserved for future use.

> **NOTE**: A schema file called **analytics.proto** containing the definitions of the GPB messages is available for downloading from the following location:
> https://www.juniper.net/documentation/en_US/junos13.2/topics/reference/proto-files/analytics-proto.txt

- **json**—JavaScript Object Notation (JSON). Data sent in this format is newline separated, and each record contains one stream type (queue or traffic data) per interface. Each record contains either “queue-statistics” or “traffic-statistics” in the “record type” field.
- **tsv**—Tab-separated Values (TSV). Data sent in this format is newline separated, and each record contains one stream type (queue or traffic data) per interface. Each record contains a “q” for a queue statistics, or a “t” for a traffic statistics.

The remaining statements are explained separately. See CLI Explorer.

[edit routing-instances routing-instance-name protocols bgp group group-name neighbor address]
```

Description

Apply one or more policies to routes being exported from the routing table into BGP.

If you specify more than one policy, they are evaluated in the order specified, from left to right, and the first matching filter is applied to the route. If no routes match the filters, the routing table exports into BGP only the routes that it learned from BGP. If an action specified in one of the policies manipulates a route characteristic, the policy framework software carries the new route characteristic forward during the evaluation of the remaining policies. For example, if the action specified in the first policy of a chain sets a route's metric to 500, this route matches the criterion of `metric 500` defined in the next policy.

Options

`policy-names`—Name of one or more policies.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

export (Protocols RIPng)

IN THIS SECTION

- Syntax | 6687
- Hierarchy Level | 6687
- Description | 6687

- Options | 6687
- Required Privilege Level | 6687
- Release Information | 6688

Syntax

```
export [ policy-names ];
```

Hierarchy Level

```
[edit logical-systems logical-system-name protocols ripng group group-name],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols
ripng group group-name],
[edit protocols ripng group group-name],
[edit routing-instances routing-instance-name protocols ripng group group-name]
```

Description

Apply a policy or list of policies to routes being exported to the neighbors.

By default, RIPng does not export routes it has learned to its neighbors. To have RIPng export routes, apply one or more export policies. To apply export policies and to filter routes being exported from the local routing device to its neighbors, include the `export` statement and list the name of the policy to be evaluated.

You can define one or more export policies. If no routes match the policies, the local routing device does not export any routes to its neighbors. Export policies override any metric values determined through calculations involving the values configured with the `metric-in` and `metric-out` statements.

Options

policy-names—Name of one or more policies.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Support for routing instances introduced in Junos OS Release 9.0.

[edit routing-options rib-groups group-name]
```

Description

Specify the name of the routing table from which Junos OS should export routing information. For any individual RIB group, only one table can be specified in the `export-rib` statement.

The `export-rib` statement specifies the source table from which routing information is advertised.

One common use of the `export-rib` statement is interdomain routing. The export RIB is the table used when BGP extracts routes to advertise to peers. In multicast interdomain routing, for example, the export RIB is likely to be inet.2.

Another use of `export-rib` is dynamic route leaking between the global routing table (inet.0) and a VRF routing table (*instance*.inet.0). For example, you can use a RIB group to copy routes learned in the VRF into the global routing table, inet.0, or copy routes learned in inet.0 into a VRF. You define the use of this RIB group in the VRF's BGP configuration. In a routing policy you can do dynamic filtering of routes. For instance, you can use an import policy to only copy routes with certain communities into the global routing table.

For example:

```
rib-groups {
    rib-interface-routes-v4 {
        import-rib [ inet.0 VRF.inet.0 ];
    }
    rib-import-VRF-routes-to-inet0-v4 {
        export-rib VRF.inet.0;
        import-rib [ VRF.inet.0 inet.0 ];
        import-policy rib-import-VRF-routes-to-inet0-v4;
    }
    rib-import-inet0-routes-to-VRF-v4 {
        export-rib inet.0;
        import-rib [ inet.0 VRF.inet.0 ];
        import-policy rib-import-inet0-routes-to-VRF-v4;
    }
}
routing-options {
    interface-routes {
        rib-group {
            inet rib-interface-routes-v4;
        }
```

```
    }
}
protocols {
    bgp {
        group iBGP-peers {
            type internal;
            family inet {
                unicast {
                    rib-group rib-import-inet0-routes-to-VRF-v4;
                }
            }
        }
    }
}
routing-instances {
    VRF {
        routing-options {
            interface-routes {
                rib-group {
                    inet rib-interface-routes-v4;
                }
            }
        }
        protocols {
            bgp {
                group peersin-VRF {
                    family inet {
                        unicast {
                            rib-group rib-import-VRF-routes-to-inet0-v4;
                        }
                    }
                }
            }
        }
    }
}
```

```
[edit logical-systems logical-system-name routing-instances routing-instance-name routing-
options forwarding-table],
[edit logical-systems logical-system-name routing-options forwarding-table],
[edit routing-instances routing-instance-name routing-options forwarding-table],
[edit routing-options forwarding-table]
```

Description

Apply one or more policies to routes being exported from the routing table into the forwarding table.

In the `export` statement, list the name of the routing policy to be evaluated when routes are being exported from the routing table into the forwarding table. Only active routes are exported from the routing table.

You can reference the same routing policy one or more times in the same or a different `export` statement.

You can apply export policies to routes being exported from the routing table into the forwarding table for the following features:

- Per-packet load balancing
- Class of service (CoS)

Options

policy-name—Name of one or more policies.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

- Release Information | 6694

Syntax

```
export-target {
    target target-community;
    unicast;
}
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols mvpn
route-target],
[edit routing-instances routing-instance-name protocols mvpn route-target]
```

Description

Enable you to override the Layer 3 VPN import and export route targets used for importing and exporting routes for the MBGP MVPN network layer reachability information (NLRI).

Options

`target` *`target-community`*—Specify the export target community.

`unicast`—Use the same target community as specified for unicast.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.4.

expression

IN THIS SECTION

- Syntax | 6695
- Hierarchy Level | 6695
- Description | 6695
- Options | 6695
- Required Privilege Level | 6695
- Release Information | 6695

Syntax

```
expression boolean-expression;
```

Hierarchy Level

```
[edit security idp custom-attack attack-name attack-type chain]
```

Description

Configure the Boolean expression. The Boolean expression defines the condition for the individual members of a chain attack that will decide if the chain attack is hit.

For standalone IDP devices, expression overrides order function.

For SRX Series Firewalls, expression and order cannot be configured together. Only one of them can be specified.

Options

boolean-expression—Boolean operators:

- `or`—If either of the member name patterns match, the expression matches.
- `and`—If both of the member name patterns match, the expression matches. It does not matter which order the members appear in.
- `oand`—If both of the member name patterns match, and if they appear in the same order as in the Boolean Expression, the expression matches.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.3.

extended-vni-list

IN THIS SECTION

- Syntax | **6711**
- Hierarchy Level | **6711**
- Description | **6711**
- Options | **6712**
- Required Privilege Level | **6712**
- Release Information | **6712**

Syntax

```
extended-vni-list [list of VNIs / all];
```

Hierarchy Level

For MX Series routers, EX9200, and QFX Series switches:

```
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols],
[edit routing-instances routing-instance-name protocols evpn]
```

Description

Establishes which VXLAN Network Identifiers (VNI) will be part of the Virtual Switch (VS) instance. When you issue the `commit check` command to verify the candidate configuration syntax without committing it, it also checks if the specified VNI(s) is associated with a bridge domain (BD) (`bridge-domain` *`name`* `vxlan vni`).

There are different broadcast, unknown unicast, and multicast (BUM) replication options available in Ethernet Virtual Private Network (EVPN). By using the `extended-vni-list` statement, you forgo a multicast underlay in favor of EVPN and VXLAN ingress-replication.

NOTE: The `extended-vni-list` statement is an exclusive command. You cannot configure the `extended-vni-list` statement with either the `extended-vlan-list` or `extended-vni-all` statements.

NOTE: If you configure the `extended-vni-list` statement, then you must also configure the `encapsulation (protocols evpn)` `vxlan` statement.

NOTE: The `extended-vni-list` statement is optional for routing-instances of type `mac-vrf`. In the mac-vrf type routing instance, all VNI are extended by default.

If you configure an `extended-vni-list` within a specific `mac-vrf` type routing instance, you negate the default behavior for that routing instance.

Options

list of VNIs Specify a single VNI or list of VNIs as part of the VS instance, for example `extended-vni-list [ 10-50 60 70]`.

all Include all VNIs as part of the VS instance. By specifying `all`, you bypass the `commit check` process and all configured BDs in the EVPN are considered extended.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.1X53-D15.

Support for logical systems on MX Series routers added in Junos OS Release 17.4R1.

- Release Information | 6714

Syntax

```
extensible-subscribe-services {
     access-profile access-profile-name;
     commit-interval interval;
     dictionary dictionary-path;
     flat-file-profile flat-file-profile;
     logical-interface-init-range {
          high;
          low;
     }
     maximum-subscribers limit;
}
```

Hierarchy Level

```
[edit system services]
```

Description

Configure the extensible subscriber services manager. Extensible Subscriber Services Manager (ESSM) is a background process that is part of the Intelligent Customer Extendable authentication, authorization, and accounting (ICE-AAA) framework, which supports customer extensible services for both business and residential subscribers.

Options

access-profile Access profile name for time-accounting specified using this configuration. In most cases access-profile radius server information is same as control session access-profile. It is a mandatory configuration.

commit-interval	The ESSM daemon issues commit request at the interval specified in this configuration.
dictionary	XML dictionary file is specified using this configuration command. It is a complete path with dictionary file name. The daemon takes action for the extensible-service request based on the XML description in the file. It is a mandatory configuration.
flat-file-profile	Refer a flat-file accounting profile that defines the contents of a flat file that records accounting statistics collected from the Packet Forwarding Engine for an interface at regular intervals.
logical-interface-init-range	Logical interface unit range. The daemon assigns the first available unit number in the range specified. Default low is 1 and high is 16385.
maximum-subscribers	Number of control subscriber sessions supported can be limited by using this configuration command. Default maximum is 1000.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1R1.

extension-header

}
```

Hierarchy Level

```
[edit chassis fpc slot-number pic pic-number adaptive-services service-package]
```

Description

Configure an application on a PIC.

> **CAUTION**: Do not configure these settings unless it is specified you should do so. The default settings work under most normal scenarios. Unneeded settings can cause negative effects.

> **NOTE**: The PICs of MS-MPC and MS-MIC support only `extension-provider` service-package.

When the `extension-provider` statement is first configured, the PIC reboots.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.0.

```

Description

Configure extensions to Junos OS.

You must configure the `providers` statement to enable application packages developed using the Junos SDK to be deployed and run on the router.

You must configure the `extension-service` statement to enable application packages developed using the Juniper Extension Toolkit (JET) to be deployed and run on the device.

The remaining statements are explained separately. See CLI Explorer.

> **NOTE**: This configuration is optional in Junos OS Evolved. You can run JET applications directly using a Python interpreter instead of configuring and invoking them in the CLI.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.0.

`extension-service` option introduced in Junos OS Release 16.1.

external-assigned (Address Pools)

IN THIS SECTION

- Syntax | 6725
- Hierarchy Level | 6725
- Description | 6725
- Required Privilege Level | 6725
- Release Information | 6725

Syntax

```
external-assigned;
```

Hierarchy Level

```
[edit access address-assignment address-pools name family inet network network-prefix],
[edit access address-assignment address-pools name family inet6 network network-prefix]
```

Description

Assign addresses in network prefixes statically.

Required Privilege Level

access—To view this statement in the configuration.

access-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.1.

external-authority

IN THIS SECTION

- Syntax | 6726
- Hierarchy Level | 6726
- Description | 6726
- Required Privilege Level | 6727
- Release Information | 6727

Syntax

```
external-authority;
```

Hierarchy Level

```
[edit logical-systems logical-system-name routing-instances routing-instance-name system
services dhcp-local-server pool-match-order],
[edit logical-systems logical-system-name system services dhcp-local-server pool-match-order],
[edit routing-instances routing-instance-name system services dhcp-local-server pool-match-order],
[edit system services dhcp-local-server pool-match-order]
```

Description

Specify that an external authority (for example, RADIUS or Diameter) provides the address assignment.

When RADIUS is the external authority, the router uses the Framed-IPv6-Pool attribute (RADIUS attribute 100) to select the pool. When Diameter is the external authority, the router uses the Diameter counterpart of RADIUS Framed-IPv6-Pool attribute.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.0.

f-max-period

IN THIS SECTION

- Syntax | 6743
- Hierarchy Level | 6743
- Description | 6743

- Options | 6743
- Required Privilege Level | 6743
- Release Information | 6743

Syntax

```
f-max-period number;
```

Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number],
[edit interfaces interface-name unit logical-unit-number rtp]
```

Description

For all adaptive services interfaces and for ISDN interfaces on J Series Services Routers. Specify the maximum number of compressed packets allowed between the transmission of full headers in a compressed Real-Time Transport Protocol (RTP) traffic stream.

Options

number—Maximum number of packets. The value can be from 1 through 65535.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

RELATED DOCUMENTATION

f-max-period (rtp)

IN THIS SECTION

- Syntax | 6744
- Hierarchy Level | 6744
- Description | 6744
- Options | 6745
- Required Privilege Level | 6745
- Release Information | 6745

Syntax

```
f-max-period number;
```

Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number compression rtp],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number
compression rtp]
```

Description

Specify the maximum number of compressed packets allowed between the transmission of full headers in a compressed Real-time Transport Protocol (RTP) traffic stream.

Options

number—Maximum number of packets.

- **Default:** 256

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

    }
}
```

Hierarchy Level

```
[edit]
```

Description

(QFabric systems only) Define resources, routing options, fabric control protocol settings, and the mapping of user-defined names to QFabric system components.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.3.

fabric (Class-of-Service)

IN THIS SECTION

- Syntax | 6748
- Hierarchy Level | 6748
- Description | 6748
- Required Privilege Level | 6748
- Release Information | 6748

Syntax

```
fabric {
    scheduler-map {
        priority (high | low) scheduler scheduler-name;
    }
}
```

Hierarchy Level

```
[edit class-of-service]
```

Description

Define CoS parameters of the switch fabric. For M320 routers, MX Series routers, T Series routers and EX Series switches only, associate a scheduler with a fabric priority.

On EX Series switches, this statement is supported only on EX8200 standalone switches and EX8200 Virtual Chassis.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

RELATED DOCUMENTATION

Associating Schedulers with Fabric Priorities

fabric-control

IN THIS SECTION

- Syntax | 6749
- Hierarchy Level | 6749
- Description | 6749
- Required Privilege Level | 6749
- Release Information | 6750

Syntax

```
fabric-control {
    graceful-restart {
        restart-time seconds;
        stale-routes-time seconds;
    }
}
```

Hierarchy Level

```
[edit fabric protocols]
```

Description

Specify attributes for the fabric control protocol.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2X52-D10.

- Release Information | 6751

Syntax

```
fabric-id fc-fabric-id;
```

Hierarchy Level

```
[edit fc-fabrics fc-fabric-name]
```

Description

Configure a unique identifier for the FC fabric.

NOTE: Changing the ID of an FC fabric causes all logins to drop and forces the ENodes to log in again.

Options

fc-fabric-id —Unique identifier of the FC fabric.

Required Privilege Level

storage—To view this statement in the configuration.
storage-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.1.

fabric-load-balance

IN THIS SECTION

- Syntax | 6753
- Hierarchy Level | 6753
- Description | 6753
- Default | 6754
- Options | 6754
- Required Privilege Level | 6754
- Release Information | 6755

Syntax

```
fabric-load-balance {
    flowlet {
        inactivity-interval interval;
    }
    per-packet;
}
```

Hierarchy Level

```
[edit forwarding-options enhanced-hash-key]
```

Description

Enable adaptive load balancing (ALB) for a VCF, and specify how ALB is implemented.

NOTE: Starting in Junos OS Release 14.1X53-D46, 15.1R7, 16.1R6, 17.1R3, 17.2R2, 17.3R2, and 17.4R1, the ALB feature is deprecated. If `fabric-load-balance` is enabled in the configuration, delete the configuration item upon upgrading Junos OS.

When ALB is enabled, the Virtual Chassis ports (VCPs) are reset. Packets are dropped and might potentially arrive out of order for a brief period of time as a result of this VCP reset. Normal operation of the VCF resumes after the VCP reset with no further user action.

Default

ALB is disabled, by default.

If you do not specify a mode when enabled ALB, ALB is enabled using flowlet mode with an inactivity timer of 16 microseconds.

Options

`flowlet` Implement ALB by using flowlets.

When ALB is implemented using flowlets, traffic flows that enter the VCF are spliced into smaller flows—flowlets—and individually forwarded across the VCF to the same destination device over different paths when the inactivity time between packet bursts on the sending interface exceeds the user-configurable inactivity interval.

The inactivity interval is 16 microseconds by default, and can be configured using the `inactivity-interval` statement. You should configure the inactivity interval to ensure in-order packet delivery, so that overall performance is not negatively impacted by the packet reordering process at the receiving device. To ensure in-order packet delivery, the inactivity interval should be larger than the largest latency skew among all the paths in the VCF from any node to any other node.

Implementing ALB using flowlets is especially effective in environments that periodically experience extremely large traffic flows—*elephant flows*—that are substantially larger than the majority of other traffic flowing through the VCF. The VCF is better able to manage elephant flows by splicing them into smaller flowlets using ALB.

`per-packet` Implement ALB using per-packet mode.

When per-packet mode is enabled, the VCF forwarding algorithm dynamically monitors all paths in the VCF and forwards packets to destination devices using the best available path at that moment. Flows are reordered at the destination node when per-packet mode is used to enable ALB, so some performance impact due to packet reordering is experienced.

Required Privilege Level

system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.1X53-D10.

Statement deprecated starting in Junos OS Releases 14.1X53-D46, 15.1R7, 16.1R6, 17.1R3, 17.2R2, 17.3R2, and 17.4R1.

fabric loopback wan

IN THIS SECTION

- Syntax | 6755
- Hierarchy Level | 6755
- Description | 6756
- Default | 6756
- Options | 6756
- Required Privilege Level | 6756
- Release Information | 6756

Syntax

```
fabric loopback wan (off | on);
```

Hierarchy Level

```
[edit chassis fpc slot-number]
```

Description

Allow the fabric bound packets to take new fabric loopback path, freeing up the WAN bandwidth thus improving the sampling and tunneling performance of the router.

You can configure fabric side loopback by using the `fabric loopback wan off` option or switch to WAN side by using the `fabric loopback wan on` option. By default, Junos OS uses fabric loopback for the loopback packets.

Default

`off`

Options

`off`—Configure fabric bound packets to take fabric loopback path.

`on`—Configure fabric bound packets to take the WAN loopback path.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 20.3.

fabric-maintenance-associations

IN THIS SECTION

- Syntax | 6757

Release Information | 6758

Syntax

```
fabric-maintenance-associations {
    fma-name {
        description string;
        fabric-maintenance-end-points {
            fmep-id {
                description string;
                fmep-interface interface-name;
                fmep-name name;
            }
        }
        vlan-name vlan-name;
    }
}
```

Hierarchy Level

```
[edit protocols oam fabric]
```

Description

Configure the fabric maintenance association (FMA) parameters for internal fabric monitoring. The FMA defines a set of QFabric system interfaces (fabric maintenance endpoints [FMEPs]) that are members of a given VLAN which are used in internal fabric monitoring operations. The FMA associates the set of FMEPs with a VLAN. Configuration of the VLAN is mandatory.

The remaining statements under this hierarchy level are explained separately.

Options

description *string* Description of the FMA.

- **Syntax:** 1 to 128 alphanumeric characters

fma-name Name of the FMA.

- **Syntax:** 1 to 20 alphanumeric characters

vlan-name *vlan-name* Name of the VLAN for which the FMA is defined.

> **NOTE**: Configuring the VLAN option is mandatory.

Required Privilege Level

ping fabric unicast-flow | **12542**

traceroute fabric unicast-flow | **29924**

fabric-options

IN THIS SECTION

- Syntax | **6764**
- Hierarchy Level | **6764**
- Description | **6764**
- Options | **6765**
- Required Privilege Level | **6765**

Release Information | 6765

Syntax

```
fabric-options {
    member-interfaces member-interface-name;
}
```

Hierarchy Level

```
[edit interfaces interface-name]
```

Description

Configure fabric interface specific options in chassis clusters.

The fabric is the data link between the nodes and is used to forward traffic between the chassis. Each node in the chassis requires a fabric interface configured. To create a fabric link between the two chassis requires the creation of a special interface called the fab interface. Node 0's fabric interface, called fab0, and node 1's fabric interface, called fab1.

Only the same type of interfaces can be configured as fabric children, and you must configure an equal number of child links for fab0 and fab1.

You can enable and disable the fabric link on SRX1500, SRX4100, SRX4200, and SRX4600 devices.

From configuration mode,

run the `set interfaces fab0 disable` command to disable the fabric link interface fab0 and `set interfaces fab1 disable` command to disable the fabric link interface fab1.

run the `delete interfaces fab0 disable` to enable fabric link interface fab0 and `delete interfaces fab1 disable` to enable fabric link interface fab1.

```
fab0 {
    fabric-options {
        member-interfaces {
            ge-0/0/4;
```

```
        }
    }
}
fab1 {
    fabric-options {
        member-interfaces {
            ge-2/0/4;
        }
    }
}
```

NOTE: When you run the `system autoinstallation` command, the command will configure unit 0 logical interface for all the active state physical interfaces. However, a few commands such as `fabric-options` do not allow the physical interface to be configured with a logical interface. If the `system autoinstallation` and the `fabric-options` commands are configured together, the following message is displayed:

```
incompatible with 'system autoinstallation'
```

Options

member-interface-name—Member interface name.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

fabric-tree-root

IN THIS SECTION

- Syntax | 6766
- Hierarchy Level | 6766
- Description | 6766
- Required Privilege Level | 6767
- Release Information | 6767

Syntax

```
fabric-tree-root;
```

Hierarchy Level

```
[edit virtual-chassis member member-id]
```

Description

Optionally specify a member of a VCF to be a root node for creating the shared multicast distribution trees (MDTs) used in forwarding broadcast, unknown unicast, and multicast (BUM) traffic within the VCF. To configure this option, the VCF must be configured as "auto-provisioned" on page 2725 or "preprovisioned" on page 13115.

> **NOTE**: This option only affects MDTs used for directing traffic internally between member nodes of the VCF, and does not affect how BUM traffic is managed on the network outside the VCF.

Setting this option affects BUM traffic routing behavior within the VCF by changing how VCF MDT trees are created. By default, if this option is not configured for any VCF members, every member switch builds an MDT with itself as the root. When this option is configured for one or more VCF members, MDTs are only created with the specified member or members as root nodes. The number of trees created corresponds to the configured number of root nodes.

If you want to use this option in a VCF, we recommend configuring *all* the spine devices in the VCF (regardless of the role—Routing Engine or linecard), and *only* spine devices, as fabric tree roots. Configuring multiple spine devices as fabric tree roots prevents inadvertently reverting to the default behavior if a spine member becomes unavailable. Avoiding leaf members as fabric tree roots helps to prevent traffic interruption during load rebalancing when a leaf node goes offline or is reset.

See *Understanding Traffic Flow Through a Virtual Chassis Fabric* for more information about how this option affects traffic flow.

failover-delay

IN THIS SECTION

- Syntax | 6781
- Hierarchy Level | 6781
- Description | 6782
- Options | 6782
- Required Privilege Level | 6782
- Release Information | 6782

Syntax

```
failover-delay milliseconds;
```

Hierarchy Level

```
[edit protocols vrrp]
```

Description

If you configure multiple VRRP groups on an interface (using multiple VLANs), traffic for some of the groups might be briefly dropped if a failover occurs. This can happen because the new primary must send gratuitous ARP replies for each VRRP group to update the ARP tables in the connected devices, and there is a short delay between each gratuitous ARP reply. Traffic sent by devices that have not yet received the gratuitous ARP reply is dropped (until the device receives the reply and learns the MAC address of the new primary).

If you configure a failover delay, the new primary delays sending gratuitous ARP replies for the period that you set. This allows the new primary to send the ARP replies for all of the VRRP groups simultaneously.

Options

milliseconds—Specify the failover delay time, in milliseconds.

- **Range:** 50 through 2000

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

failover-resync

IN THIS SECTION

- Syntax | 6783
- Hierarchy Level | 6783
- Description | 6783
- Options | 6784
- Required Privilege Level | 6784
- Release Information | 6784

Syntax

```
failover-resync (failover-protocol | silent-failover);
```

Hierarchy Level

```
[edit services l2tp tunnel]
```

Description

Configure the method used by the LAC or the LNS to resynchronize with its peer in the event of a control plane failover. Failure can be the result of a Routing Engine switchover, a daemon restart, or some other cause. During tunnel setup, the L2TP endpoints negotiate the resynchronization method; silent failover is the default.

With the silent failover method, only the failed endpoint is involved in recovering the tunnels and sessions; the nonfailed endpoint remains unaware of the failure.

With the failover protocol method, the nonfailed endpoint keeps the tunnel open with the failed peer, in case the failed peer is able to recover from the failure and resynchronize with the nonfailed peer. The detection of tunnel keepalive failures is delayed. This behavior keeps the tunnel up and the subscribers logged in while traffic is not flowing, preventing service level agreements from being met.

BEST PRACTICE: Use the default method, silent failover.

This statement supersedes the deprecated statement, `disable-failover-protocol`.

Options

failover-protocol Specify the L2TP failover protocol as the resynchronization method, but fall back to silent failover if the other endpoint does not support it.

silent-failover Specify silent failover as the resynchronization method.

- **Default:** `silent-failover`

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.2R1.

RELATED DOCUMENTATION

failover (System Process)

IN THIS SECTION

Syntax | 6785

Hierarchy Level | 6785

- Description | 6785
- Options | 6785
- Required Privilege Level | 6785
- Release Information | 6786

Syntax

```
failover (alternate-media | other-routing-engine);
```

Hierarchy Level

```
[edit system processes process-name]
```

Description

Configure the router to reboot if the software process fails four times within 30 seconds, and specify the software to use during the reboot.

Options

process-name—Junos OS process name. Some of the processes that support the `failover` statement are `bootp`, `chassis-control`, `craft-control`, `ethernet-connectivity-fault-management`, `init`, `interface-control`, `neighbor-liveness`, `pfe`, `redundancy-interface-process`, `routing`, `smg-service`, and `vrrp`.

`alternate-media`—Use the Junos OS image on alternate media during the reboot.

`other-routing-engine`—On routers with dual Routing Engines, use the Junos OS image on the other Routing Engine during the reboot. That Routing Engine assumes the primary role; in the usual configuration, the other Routing Engine is the designated backup Routing Engine.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

failover-within-preference (L2TP LAC)

IN THIS SECTION

- Syntax | 6786
- Hierarchy Level | 6786
- Description | 6786
- Required Privilege Level | 6787
- Release Information | 6787

Syntax

```
failover-within-preference;
```

Hierarchy Level

```
[edit services l2tp]
```

Description

Enable L2TP LAC tunnel selection within a preference level. When the router is unable to connect to a destination at a given preference level, it attempts to connect to another destination at the same level.

By default, when a connection attempt fails at one preference level, the next attempt is made at the next lower level.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.4.

[edit forwarding-options dhcp-relay group group-name liveness-detection],
[edit forwarding-options dhcp-relay dhcpv6 group group-name liveness-detection]
```

Description

Configure the action the router (or switch) takes when a liveness detection failure occurs.

Options

- **Default:** `clear-binding`

`clear-binding`—The DHCP client session is cleared when a liveness detection failure occurs, except when `maintain-subscribers interface-delete` setting is configured and active.

`clear-binding-if-interface-up`—The DHCP client session is cleared only when a liveness detection failure occurs and the local interface is detected as being up. Use this setting to distinguish failures from between a liveness detection failure due to a local network error, and a host disconnecting from the network. If the client binding is in the maintain-binding Finite State Machine (FSM) state when the liveness detection failure detection occurs, then the binding is not deleted. Not supported for Layer 2 ARP/ND liveness detection on MX Series routers.

`log-only`—A message is logged to indicate the event; no action is taken and DHCP is left to manage the failure and maintain the client binding. Not supported for Layer 2 ARP/ND liveness detection on MX Series routers.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1.

[edit protocols ldp oam bfd-livenesss-detection],
[edit protocols ldp oam fec address bfd-livenesss-detection]
```

Description

Configure route and next-hop properties in the event of a BFD session failure event on an LDP LSP. The failure event could be an existing BFD session that has gone down or could be a BFD session that never came up. LDP adds back the route or next hop when the relevant BFD session comes back up.

Options

`remove-nexthop`—Remove a route corresponding to a next hop of the LSP's route at the ingress node when a BFD session failure event is detected.

`remove-route`—Remove the route corresponding to an LSP from the appropriate routing tables when a BFD session failure event is detected. If the LSP is configured with ECMP and a BFD session corresponding to any path goes down, the route is removed.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.4.

liveness-detection],
[edit protocols mpls label-switched-path lsp-name oam bfd-liveness-detection],
[edit protocols mpls oam bfd-liveness-detection]
```

Description

Configure route and next-hop properties in the event of a Bidirectional Forwarding Detection (BFD) protocol session failure event on an RSVP label-switched path (LSP). The failure event could be an existing BFD session that has gone down or a BFD session that never came up. RSVP adds back the route or next hop when the relevant BFD session comes back up.

Options

`make-before-break`—When a BFD session fails for an RSVP LSP, an attempt is made to signal a new LSP path before tearing down the old LSP path.

`teardown`—When a BFD session fails for an RSVP LSP, the associated LSP path is taken down and resignaled immediately.

`teardown-timeout` *seconds*—When you configure the `make-before-break` option, you can specify a time in seconds for the `teardown-timeout` option. At the end of the time specified, the associated RSVP LSP is automatically torn down and resignaled.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.4.

- Hierarchy Level | 6794
- Description | 6794
- Default | 6795
- Options | 6795
- Required Privilege Level | 6795
- Release Information | 6795

Syntax

```
fallback-key {
    cak hexadecimal-number;
    ckn hexadecimal-number;
}
```

Hierarchy Level

```
[edit security macsec connectivity-association connectivity-association-name]
```

Description

Specifies the fallback preshared key (PSK) to be used to enable MACsec using static connectivity association key (CAK) security mode. You can configure a fallback PSK to prevent traffic loss in case the primary PSK fails to establish a connection.

When you enable MACsec using static CAK security mode, a preshared PSK is exchanged between the devices on each end of the point-to-point Ethernet link. The PSK is includes a connectivity association name (CKN) and a connectivity association key (CAK). The PSK must match across devices for a MACsec session to be established. If there is a mismatch, the session will not be established and all packets will

be dropped. The fallback PSK is used when the primary PSK does not match for the initial MACsec negotiation.

Default

Fallback PSK is not enabled by default.

Options

The remaining statements are explained separately.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

fallback-option (ICAP Redirect Service)

IN THIS SECTION

- Syntax | 6797
- Hierarchy Level | 6797
- Description | 6797
- Options | 6798
- Required Privilege Level | 6798
- Release Information | 6799

Syntax

```
fallback-option {
    connectivity (block | log-permit | permit);
    default-action (block | log-permit | permit);
    timeout (block | log-permit | permit);
}
```

Hierarchy Level

```
[edit services icap-redirect profile name],
[edit logical-systems logical-system-name services icap-redirect profile name]
```

Description

Specify fallback options for the device. Fallback settings enable the device to handle errors.

The fallback option is used to define the actions such as permit, log-and-permit, or block. This is the action that occurs when a request fails due to conditions such as too many requests, or a timeout occurred, or connectivity issues.

Options

connectivity Fallback settings when connection-related failures occur.

- Values:
  - block—Log the error and deny the requests.
  - log-permit—Log the error and permit the requests.
  - permit—Permit the requests.

default-action Default failure action.

- Values:
  - block—Log the error and deny the requests.
  - log-permit—Log the error and permit the requests.
  - permit—Permit the requests.

throttle Fallback action when the total number of requests received concurrently exceeds the devices limit.

- Values:
  - block—Log the error and deny the requests.
  - log-permit—Log the error and permit the requests.
  - permit—Permit the requests.

timeout Fallback action when there is a timeout occurrence.

- Values:
  - block—Log the error and deny the requests.
  - log-permit—Log the error and permit the requests.
  - permit—Permit the requests.

Required Privilege Level

```

Description

Set the interval between samples after the rising threshold is exceeded and the value of the sample starts to drop. If the value of the sample drops and exceeds the falling threshold, the regular sampling interval is used.

Options

seconds—Time between samples, in seconds.

- **Range:** 1 through 2,147,483,647 seconds
- **Default:** 60 seconds

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.3.

RELATED DOCUMENTATION

Configuring the Falling Threshold Interval

interval (RMON) | 9206

falling-threshold (percentage)

IN THIS SECTION

- Syntax | 6815
- Hierarchy Level | 6816
- Description | 6816
- Options | 6816
- Required Privilege Level | 6816
- Release Information | 6816

Syntax

```
falling-threshold percentage;
```

Hierarchy Level

```
[edit snmp health-monitor],
[edit snmp health-monitor idp]
```

Description

Set the lower threshold for the monitored object when you configure a health monitor alarm. By setting a rising and a falling threshold for a monitored variable, you can be alerted whenever the value of the variable falls outside the allowable operational range.

Options

percentage—The lower threshold for the alarm entry.

- **Range:** `1` through `100`
- **Default:** `70` percent of the maximum possible value

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.0.

falling-threshold (RMON)

IN THIS SECTION

- Syntax | 6817
- Hierarchy Level | 6817
- Description | 6817
- Options | 6817
- Required Privilege Level | 6818
- Release Information | 6818

Syntax

```
falling-threshold integer;
```

Hierarchy Level

```
[edit snmp rmon alarm index]
```

Description

Set the lower threshold for the sampled variable (monitored object) when you configure an SNMP RMON alarm. By setting a rising and a falling threshold for a variable, you can be alerted whenever the value of the variable falls outside the allowable operational range.

Options

integer—Lower threshold for the alarm entry.

- **Range:** –2,147,483,648 through 2,147,483,647
- **Default:** 20 percent less than the `rising-threshold` value

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.1.

false-positives

IN THIS SECTION

- Syntax | 6819
- Hierarchy Level | 6819
- Description | 6819
- Options | 6819
- Required Privilege Level | 6819
- Release Information | 6819

Syntax

```
false-positives {
    values [frequently occasionally rarely unknown];
}
```

Hierarchy Level

```
[edit security idp dynamic-attack-group dynamic-attack-group-name filters]
```

Description

Specify a false positives filter to track attack objects based on the frequency that the attack produces a false positive on your network.

Options

`values`—Name of the false positives filter. You can select from the following false positive frequency:

- `frequently`—Frequently track false positive occurrences.
- `occasionally`—Occasionally track false positive occurrences.
- `rarely`—Rarely track false positive occurrences.
- `unknown`—By default, all compound attack objects are set to Unknown. As you fine-tune IDP to your network traffic, you can change this setting to help you track false positives.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.3.

family (RFC 2544 Benchmarking Tests)

IN THIS SECTION

- Syntax | 6820
- Junos OS Hierarchy Level | 6820
- Junos OS Evolved Hierarchy Level | 6820
- Description | 6820
- Options | 6821
- Required Privilege Level | 6821

```
[edit services rpm rfc2544-benchmarking tests test-name test-name]
```

Junos OS Evolved Hierarchy Level

```
[edit services monitoring rfc2544 tests test-name test-name]
```

Description

Configure the address type family for the benchmarking test.

Options

bridge	(Junos OS) Run the test on a Layer 2 Ethernet line (E- Line) or an Ethernet LAN (E-LAN) service configured in a bridge domain. You can run the RFC2544-based benchmarking test only in the egress direction or the user-to-network interface (UNI) direction of an Ethernet line.
ccc	Run the test on a layer 2 VPN, circuit cross-connect (CCC), or Ethernet pseudowire service (such as EVPN-VPWS). You can run the RFC2544-based benchmarking test either in the egress or ingress direction.
ethernet-switching	(Junos OS Evolved) Run the test over a Layer 2 bridge service, EVPN-MPLS network, or a Virtual Private LAN Service (VPLS). You can run the RFC2544-based benchmarking test only in the egress direction or the user-to-network interface (UNI) direction of an Ethernet line.
inet	Run the test on an IPv4 service.
vpls	(Junos OS) Run the test over a Virtual Private LAN Service (VPLS).

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3X52.

`bridge` option introduced in Junos OS Release 12.3X53 for ACX Series routers.

`bridge` option introduced in Junos OS Release 14.2 for MX104 Universal Routing Platforms.

Statement introduced in Junos OS Evolved Release 21.1R1 for the `inet` option only.

`ccc` and `ethernet-switching` options introduced in Junos OS Evolved Release 22.4R1.

Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number],
[edit interfaces interface-range interface-name unit logical-unit-number family]
```

Description

Configure protocol family information for the logical interface on QFX Series switches.

Default

Access interfaces on the QFX Series are set to **family ethernet-switching** by default. If you are going to change the family setting for an interface, you might have to delete this default setting or any user-configured family setting first.

You must configure a logical interface to be able to use the physical device.

Options

Interface types on the switch are:

- Aggregated Ethernet (**ae**)
- Gigabit Ethernet (**ge**)
- Loopback (**lo0**)
- Management Ethernet (**me0**)
- Routed VLAN interface (RVI) (**vlan**)
- 10-Gigabit Ethernet (**xe**)

Not all interface types support all **family** substatements. Check your switch CLI for supported substatements for a particular protocol family configuration.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.1.

        }
    }
}
```

Hierarchy Level

```
[edit firewall]
```

Description

Configure the fields a firewall filter can match on.

Options

family-name—Type of addressing protocol:

- `ethernet-switching`—Filter Layer 2 Ethernet packets and Layer 3 (IP) packets (allows some Layer 3 filtering). Not supported on OCX Series switches.
- `egress-to-ingress`—Include this option to increase the number of egress VLAN firewall filter terms from 1024 to 2048.
- `evpn`—Filter Ethernet VPN (EVPN) packets.
- `inet`—Filter Layer 3 IPv4 packets (provides additional Layer 3 filter options).
- `inet6`—Filter Layer 3 IPv6 packets (provides additional Layer 3 filter options).
- `mpls`—Filter multiprotocol label switched packets. Not supported on OCX Series switches.
- `any`—Filter packets based on protocol-independent match conditions.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.1.

`evpn` options introduced in Junos OS Release 15.1 for the MX Series.

`egress-to-ingress` option introduced in Junos OS Release 19.1R1 for the QFX5110.

`any` option introduced in Junos OS Release 22.4R1 for supported QFX5120, EX4100, EX4400, and EX4650 Series switches.

micro-segmentation option introduced in Junos OS Release 22.4R1 for supported QFX5120, EX4100, EX4400, and EX4650 Series switches.

```

Description

Configure protocol family information for the logical interface.

Starting in Junos OS Release 20.1R1, aggregated ethernet interfaces supports VLAN TCC (Translational cross-connect) encapsulation on MX series platforms. See Configuring VLAN TCC Encapsulation for more details.

NOTE: Not all subordinate statements are available to every protocol family.

Options

family—Protocol family:

- `any`—Protocol-independent family used for Layer 2 packet filtering

  NOTE: This option is not supported on T4000 Type 5 FPCs.

- `bridge`—(M Series and T Series routers only) Configure only when the physical interface is configured with `ethernet-bridge` type encapsulation or when the logical interface is configured with `vlan-bridge`

type encapsulation. You can optionally configure this protocol family for the logical interface on which you configure VPLS.

- `ethernet-switching`—(M Series and T Series routers only) Configure only when the physical interface is configured with `ethernet-bridge` type encapsulation or when the logical interface is configured with `vlan-bridge` type encapsulation
- `ccc`—Circuit cross-connect protocol suite. You can configure this protocol family for the logical interface of CCC physical interfaces. When you use this encapsulation type, you can configure the `ccc` family only.
- `inet`—Internet Protocol version 4 suite. You must configure this protocol family for the logical interface to support IP protocol traffic, including Open Shortest Path First (OSPF), Border Gateway Protocol (BGP), Internet Control Message Protocol (ICMP), and Internet Protocol Control Protocol (IPCP).
- `inet6`—Internet Protocol version 6 suite. You must configure this protocol family for the logical interface to support IPv6 protocol traffic, including Routing Information Protocol for IPv6 (RIPng), Intermediate System-to-Intermediate System (IS-IS), BGP, and Virtual Router Redundancy Protocol for IPv6 (VRRP).
- `iso`—International Organization for Standardization Open Systems Interconnection (ISO OSI) protocol suite. You must configure this protocol family for the logical interface to support IS-IS traffic.
- `mlfr-end-to-end`—Multilink Frame Relay FRF.15. You must configure this protocol or multilink Point-to-Point Protocol (MLPPP) for the logical interface to support multilink bundling.
- `mlfr-uni-nni`—Multilink Frame Relay FRF.16. You must configure this protocol or `mlfr-end-to-end` for the logical interface to support link services and voice services bundling.
- `multilink-ppp`—Multilink Point-to-Point Protocol. You must configure this protocol (or `mlfr-end-to-end`) for the logical interface to support multilink bundling.
- `mpls`—Multiprotocol Label Switching (MPLS). You must configure this protocol family for the logical interface to participate in an MPLS path.
- `pppoe`—Point-to-Point Protocol over Ethernet
- `tcc`—Translational cross-connect protocol suite. You can configure this protocol family for the logical interface of TCC physical interfaces.
- `tnp`—Trivial Network Protocol. This protocol is used to communicate between the Routing Engine and the router's packet forwarding components. The Junos OS automatically configures this protocol family on the router's internal interfaces only, as discussed in Understanding Internal Ethernet Interfaces.

- `vpls`—(M Series and T Series routers only) Virtual private LAN service. You can optionally configure this protocol family for the logical interface on which you configure VPLS. VPLS provides an Ethernet-based point-to-multipoint Layer 2 VPN to connect customer edge (CE) routers across an MPLS backbone. When you configure a VPLS encapsulation type, the `family vpls` statement is assumed by default.

  MX Series routers support dynamic profiles for VPLS pseudowires, VLAN identifier translation, and automatic bridge domain configuration.

  For more information about VPLS, see the Junos OS VPNs Library for Routing Devices.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Option `max-sessions-vsa-ignore` introduced in Junos OS Release 11.4.

Change History Table

Feature support is determined by the platform and release you are using. Use Feature Explorer to determine if a feature is supported on your platform.

Release	Description
20.1R1	Starting in Junos OS Release 20.1R1, aggregated ethernet interfaces supports VLAN TCC (Translational cross-connect) encapsulation on MX series platforms.

Tunnel Services Overview

Tunnel Interface Configuration on MX Series Routers Overview

family bridge (GRE Interfaces)

IN THIS SECTION

- Syntax | 6849
- Hierarchy Level | 6849
- Description | 6849
- Options | 6850
- Required Privilege Level | 6850
- Release Information | 6850

Syntax

```
family bridge {
    interface-mode (access | trunk);
    core-facing;
    vlan-id number;
    vlan-id-list vlan-list;
}
```

Hierarchy Level

```
[edit interfaces gr-fpc/pic/port.unit]
```

Description

Configure the bridge domain family on GRE interfaces. To enable Layer 2 Ethernet packets to be terminated on GRE tunnels, you must configure the bridge domain protocol family on the `gr-` interfaces

and associate the `gr-` interfaces with the bridge domain. You must configure the GRE interfaces as core-facing interfaces, and they must be access or trunk interfaces. To configure the bridge domain family on `gr-` interfaces, include the `family bridge` statement at the `[edit interfaces gr-`*`fpc/pic/port`* `unit` *`logical-unit-number`*`]` hierarchy level.

Options

`interface-mode`—Specify the type of VLAN tagging on packets that the interface accepts.

`access`—Configure a logical interface to accept untagged packets. Specify the VLAN to which this interface belongs using the `vlan-id` statement.

`trunk`—Configure a single logical interface to accept packets tagged with any VLAN ID specified with the `vlan-id` or `vlan-id-list` statement.

`core-facing`—Specify that the VLAN is physically connected to a core-facing ISP router and ensures that the network does not improperly treat the interface as a client interface. When specified, the interface is inserted into the core-facing default mesh group where traffic from pseudowires that belong to the default mesh group is not forwarded on the core-facing link.

`vlan-id` *`number`*—Individual VLAN IDs separated by a space.

`vlan-id-list` *`vlan-list`*—Starting VLAN ID and ending VLAN ID in an inclusive range. Separate the starting VLAN ID and ending VLAN ID with a hyphen.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement at the `[edit interfaces gr-fpc/pic/port.unit]` hierarchy level introduced in Junos OS Release 15.1 for MX Series routers.

        }
    }
}
```

Hierarchy Level

```
[edit firewall],
[edit logical-systems logical-system-name firewall]
```

Description

Configure a firewall filter for IP version 4 (IPv4) or IP version 6 (IPv6) traffic. Only on MX Series routers and EX Series switches, configure a firewall filter for Layer 2 traffic in a bridging environment.

Options

family-name—Version or type of addressing protocol:

- **any**—Protocol-independent match conditions.
- **bridge**—(MX Series routers only) Layer 2 packets that are part of bridging domain.
- **ethernet-switching**—(EX Series switches) Filter Layer 2 (Ethernet) packets and Layer 3 (IP) packets.
- **ccc**—Layer 2 switching cross-connects.
- **inet**—IPv4 addressing protocol.
- **inet6**—IPv6 addressing protocol.
- **mpls**—MPLS.
- **vpls**—Virtual private LAN service (VPLS).

The remaining statements are explained separately. See CLI Explorer.

> **NOTE**: The packet lengths that a policer considers depends on the address family of the firewall filter.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Logical systems support introduced in Junos OS Release 9.3.

`simple-filter` statement introduced in Junos OS Release 7.6.

any family type introduced in Junos OS Release 8.0.

bridge family type introduced in Junos OS Release 8.4 (MX Series routers only).

family inet

IN THIS SECTION

- Syntax | 6872
- Hierarchy Level | 6872
- Description | 6872
- Options | 6872

Required Privilege Level | 6873
Release Information | 6873

Syntax

```
family inet {
    layer-3;
    layer-4;
    session-id;
    symmetric-hash {
        complement;
    }
}
```

Hierarchy Level

```
[edit forwarding-options hash-key]
```

Description

Configure layer information for the load-balancing specification. Only the IPv4 protocol is supported.

Options

`family inet`—Incorporate port data into the hash key for flow determination. By default, port data is ignored when determining flows.

- `layer-3`—Incorporate Layer 3 (IP) data into the hash key. You must include the `layer-3` statement. If you omit the `layer-3` statement, the management process removes the `hash-key` statement from the configuration and the router behaves as if you specified `layer-3`.

  By default, or if you specify only the `layer-3` statement, the router uses the following Layer 3 information in the packet header for per-flow load balancing:

  - Source IP address
  - Destination IP address

  - Protocol
  - Incoming interface index

- `layer-4`—Incorporate Layer 4 Transmission Control Protocol (TCP) or User Datagram Protocol (UDP) data into the hash key.

  If you include the `layer-4` statement, the router uses the following Layer 4 information to load-balance:

  - Source port number
  - Destination port number
  - IP type of service

- `session-id`—Include the session ID in the hash key.
- `symmetric-hash`—Create the symmetric hash key with source and destination ports.
  - `complement`—Create the complement of the symmetric hash key.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

            }
        }
    }
}
```

Hierarchy Level

```
[edit forwarding-options hash-key]
```

Description

For aggregated Ethernet and SONET/SDH interfaces only, configure load balancing based on MPLS labels and payload. Only the IPv4 protocol is supported.

Options

`family mpls`—(Aggregated Ethernet interfaces, aggregated SONET/SDH interfaces, and multiple equal-cost MPLS next hops only) Incorporate MPLS label and payload information into the hash key for per-flow load balancing. Only the IPv4 protocol is supported.

- `all-labels`—(PTX Series Packet Transport Routers only) Up to eight MPLS labels are included in the hash key to identify the uniqueness of a flow in the Packet Forwarding Engine. This is the default setting.
- `label-1`—(M120, M320, MX Series, and T Series routers only) Include the first MPLS label into the hash key. This is used for a one-label packet for per-flow load balancing IPv4 VPLS traffic based on IP information and MPLS labels.
- `label-2`—(M120, M320, MX Series, and T Series routers only) Include the second MPLS label into the hash key. This is used for a two-label packet for per-flow load balancing IPv4 VPLS traffic based on IP information and MPLS labels. To use the second MPLS label in the hash key, include both the `label-1` and `label-2` statements at the `[edit forwarding-options hash-key family mpls]` hierarchy level. By default, the router provides hashing on the first and second labels. If both labels are specified, the entire first label and the first 16 bits of the second label are hashed.
- `label-3`—(M120, M320, MX Series, and T Series routers only) Include the third MPLS label into the hash key. To use the third MPLS label, include the `label-1`, `label-2`, and `label-3` statements at the `[edit forwarding-options hash-key family mpls]` hierarchy level.
- `no-labels`—Include no MPLS labels into the hash key.
- `no-label-1-exp`—(M120, M320, MX Series, and T Series routers only) The EXP bit of the first label is not used in the hash calculation to avoid reordering complications.
- `payload`—Incorporate bits from the IP payload into the hash key for per-flow load balancing Layer 2 information based on MPLS labels.
  - `disable`—(PTX Series Packet Transport Routers only) Exclude IP payload from the hash key.
  - `ether-pseudowire`—(M120, M320, MX Series, and T Series routers only) Load-balance IPv4 traffic over Layer 2 Ethernet pseudowires.
  - `zero-control-word`—(M Series, MX Series, and PTX Series) Precedes Ethernet packet to indicate the start of an Ethernet frame in an MPLS ether-pseudowire payload.

- `ip`—Include the IP address of the IPv4 or IPv6 payload into the hash key for per-flow load balancing Layer 2 information based on MPLS labels. For the PTX Series Packet Transport Routers, this is the default setting with both Layer 3 and Layer 4 IP information included in the hash key.
  - `disable`—(PTX Series Packet Transport Routers only) Exclude IP payload from the hash key.
  - `layer-3-only`—Include only Layer 3 IP information from the IP payload data into the hash key for per-flow load balancing Layer 2 information based on MPLS labels.
  - `port-data`—(M120, M320, MX Series, and T Series routers only) Include the source and destination port field information into the hash key. By default, the most significant byte and least significant byte of the source and destination port fields are hashed. To select specific bytes to be hashed, include one or more of the `source-msb`, `source-lsb`, `destination-msb`, and `destination-lsb` options at the `[edit forwarding-options hash-key family mpls payload ip port-data]` hierarchy level. To prevent all four bytes from being hashed, include the `layer-3-only` statement at the `[edit forwarding-options hash-key family mpls payload ip]` hierarchy level.
    - `destination-lsb`—Include the least-significant byte of the destination port.
    - `destination-msb`—Include the most-significant byte of the destination port.
    - `source-lsb`—Include the least-significant byte of the source port.
    - `source-msb`—Include the most-significant byte of the source port.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

`no-label-1-exp` option introduced in Junos OS Release 8.0.

`label-3` and `no-labels` options introduced in Junos OS Release 8.1.

`ether-pseudowire` statement introduced in Junos OS Release 9.1 (M320 and T Series routers only); support extended to M120 and MX Series routers in Junos OS Release 9.4.

`all-labels` and `payload ip disable` options introduced in Junos OS Release 12.1X48R2. (PTX Series Packet Transport Routers only).

`zero-control-word` option introduced in Junos OS Release 16.1 for the M Series, MX Series, and PTX Series.

Configuring Multifield Classifiers

family multiservice

IN THIS SECTION

- Syntax | 6893
- Hierarchy Level | 6894
- Description | 6894
- Options | 6894
- Required Privilege Level | 6895
- Release Information | 6896

Syntax

```
family multiservice {
    destination-mac;
    label-1;
```

```
    label-2;
    payload {
        ip {
            layer-3 {
                (source-ip-only | destination-ip-only);
            }
            layer-3-only;
            layer-4;
        }
    }
    source-mac;
    symmetric-hash {
        complement;
    }
}
```

Hierarchy Level

```
[edit forwarding-options hash-key]
```

Description

Configure load balancing based on Layer 2 media access control information. On MX Series routers, configure VPLS load balancing. On M120 and M320 routers only, configure VPLS load balancing based on MPLS labels and IP information. For IPv4 traffic, only the IP source and destination addresses are included in the hash key. For MPLS and IPv4 traffic, one or two MPLS labels and IPv4 source and destination addresses are included. For MPLS Ethernet pseudowires, only one or two MPLS labels are included in the hash key.

Options

You can configure one or more options to load-balance using the packet information that you specify.

`destination-mac`—Include the destination-address MAC information in the hash key for Layer 2 load balancing.

`label-1` (M120 and M320 routers only)—Include the first MPLS label in the hash key. Used for including a one-label packet for per-flow load balancing of IPv4 VPLS traffic based on IP information and MPLS labels.

`label-2` (M120 and M320 routers only)—Include the second MPLS label in the hash key. If both `label-1` and `label-2` are specified, the entire first label and the first 16 bits of the second label are hashed.

`payload` (MX Series, M120, and M320 routers only)—Include the packet's IP payload in the hash key.

- `ip` (MX Series, M120, and M320 routers only)—Include the IP address of the IPv4 or IPv6 payload in the hash key.
  - `layer-3` (MX Series routers only)—Use this to include Layer 3 information from the packet's IP payload in the hash key.
    - `destination-ip-only` (MX Series routers only)—Use this to include only the destination IP address in the payload in the hash key.
    - `source-ip-only` (MX Series routers only)—Use this to include only the source IP address in the payload in the hash key.

    NOTE: You can include either the `source-ip-only` or the `destination-ip-only` statement, not both. They are mutually exclusive.

  - `layer-3-only` (M120, and M320 routers only)—Include only the Layer 3 information from the packet's IP payload in the hash key.
  - `layer-4` (MX Series routers only)—Include Layer 4 information from the packet's IP payload in the hash key.

  NOTE: On MX Series routers only, you can configure either Layer 3 or Layer 4 load balancing, or both at the same time.

  NOTE: On I chip platforms, an unknown Layer 4 header is excluded from load-balance hashing to avoid undesired packet reordering.

`source-mac`—Include the source-address MAC information in the hash key.

`symmetric-hash` (MX Series routers only)—Configure the symmetric hash or symmetric hash complement for configuring symmetrical load balancing on an 802.3ad Link Aggregation Group.

- `complement` —Include the complement of the symmetric hash in the hash key.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.0.

`ip`, `label-1`, `label-2`, `layer-3-only`, and `payload` options introduced in Junos OS Release 9.4.

`layer-3`, `layer-`. `source-ip-only`, and `destination-ip-only` options introduced in Junos OS Release 9.5.

`symmetric-hash` and `complement` options introduced in Junos OS Release 9.6.

[edit routing-instances routing-instance-name protocols bgp group group-name neighbor address]
```

Description

Enable multiprotocol BGP (MP-BGP) by configuring BGP to carry network layer reachability information (NLRI) for address families other than unicast IPv4, to specify MP-BGP to carry NLRI for the IPv6 address family, or to carry NLRI for VPNs.

Options

`any`—Configure the family type to be both unicast and multicast.

`evpn`—Configure NLRI parameters for Ethernet VPNs (EVPNs).

`inet`—Configure NLRI parameters for IPv4.

`inet6`—Configure NLRI parameters for IPv6.

`inet-mdt`—Configure NLRI parameters for the multicast distribution tree (MDT) subaddress family identifier (SAFI) for IPv4 traffic in Layer 3 VPNs.

`inet-mvpn`—Configure NLRI parameters for IPv4 for multicast VPNs.

`inet6-mvpn`—Configure NLRI parameters for IPv6 for multicast VPNs.

inet-vpn—Configure NLRI parameters for IPv4 for Layer 3 VPNs.

inet6-vpn—Configure NLRI parameters for IPv6 for Layer 3 VPNs.

`inet6-vpn`—Configure NLRI parameters for IPv6 for Layer 3 VPNs.

`iso-vpn`—Configure NLRI parameters for IS-IS for Layer 3 VPNs.

`l2vpn`—Configure NLRI parameters for IPv4 for MPLS-based Layer 2 VPNs and VPLS.

`labeled-unicast`—Configure the family type to be labeled-unicast. This means that the BGP peers are being used only to carry the unicast routes that are being used by labeled-unicast for resolving the labeled-unicast routes. This statement is supported only with inet and inet6.

`multicast`—Configure the family type to be multicast. This means that the BGP peers are being used only to carry the unicast routes that are being used by multicast for resolving the multicast routes.

`unicast`—Configure the family type to be unicast. This means that the BGP peers only carry the unicast routes that are being used for unicast forwarding purposes. The default family type is unicast.

`segment-routing-te`—Configure the family type to be segment routing traffic engineering. This means that BGP peers only carry segment routing policies for traffic steering.

> **NOTE**: If you enable `family inet-vpn unicast` for external BGP peer, Junos considers the node is positioned as an AS boundary router in an inter-provider scenario. Hence, it keeps the VPN-IPv4 routes in the routing information base (bgp.l3vpn.0), and the labels associated with the prefixes in the forwarding information base (FIB).

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

traffic-engineering],
[edit protocols isis traffic-engineering],
[edit routing-instances routing-instance-name protocols isis traffic-engineering]
```

Description

Configure the address family for traffic engineering IS-IS interior gateway protocol (IGP) shortcuts.

Options

inet Configure the IPv4 address family.

inet-mpls Configure the IPv4 MPLS address family.

inet6 Configure the IPv6 address family.

inet6-mpls Configure the IPv6 address family.

shortcuts Configure IS-IS to use MPLS label-switched paths (LSPs) as next hops if possible when installing routing information into the inet.3 or inet6.3 routing table. Internal gateway protocol (IGP) shortcuts allow the IGP to install prefixes in inet.3 or inet6.3. It is only necessary to enable IGP shortcuts on the ingress router because that is the router performing the shortest-path-first (SPF) calculations.

It is important to understand how IGP shortcuts affect the protocol and routing table relationship. The IGP performs SPF calculations to subnets downstream of LSP egress

points, but the results of these calculations are entered into the inet.3 table only. At the same time, the IGP performs its traditional SPF calculations and enters the results of these calculations into the inet.0 table. The result is that although the IGP is making entries into the inet.3 table, BGP is still the only protocol with visibility into that table for the purposes of route resolution. Therefore, forwarding to AS-internal destinations still uses the inet.0 IGP routes, and the LSPs are only used for BGP next-hop resolution. If you want the LSPs to be used for IGP next-hop resolution, you must configure `traffic-engineering bgp-igp`.

multicast-rpf-routes Install unicast IPv4 routes into the multicast routing table (inet.2) for multicast reverse-path-forwarding (RPF) checks. Traffic engineering shortcuts must be enabled. IPv4 multicast topology must not be enabled. Label-switched paths (LSPs) must not be advertised into IS-IS.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.3.

Support for IPv6 for IGP shortcuts introduced in Junos OS Release 9.3.

Support for `inet-mpls` and `inet6-mpls` statements introduced in Junos OS Release 17.2 for the MX Series routers, PTX Series routers, QFX5100, and QFX10000 switches.

[edit logical-systems logical-system-name protocols bgp group group-name neighbor address],
[edit protocols bgp group group-name],
[edit protocols bgp group group-name neighbor address]
```

Description

Enable BGP route target filtering on the VPN.

The `family route-target` statement is useful for filtering VPN routes before they are sent. Provider edge (PE) routers inform the route reflector (RR) which routes to send, using `family route-target` to provide the route-target-interest information. The RR then sends to the PE router only the advertisements containing the specified route target.

Options

`advertise-default`—Cause the router to advertise the default route target route (`0:0:0/0`) and suppress all routes that are more specific. This can be used by a route reflector on BGP groups consisting of neighbors that act as provider edge (PE) routers only. PE routers often need to advertise all routes to the route reflector. Suppressing all route target advertisements other than the default route reduces the amount of information exchanged between the route reflector and the PE routers. The Junos OS further helps to reduce route target advertisement overhead by not maintaining dependency information unless a nondefault route is received.

`external-paths` *number*—Cause the router to advertise the VPN routes that reference a given route target. The number you specify with the `external-paths` statement determines the number of external peer routers (currently advertising that route target) that receive the VPN routes. The default value is `1`.

> **NOTE**: `external-paths` cannot be configured under the `[edit protocols bgp group` *group-name* `neighbor` *address*`]` hierarchy level.

`prefix-limit` *number*—The number of prefixes that can be received from a peer router.

The remaining statement is described separately.

Required Privilege Level

```

Description

(M320 routers with Channelized OC3/STM1 Circuit Emulation PIC with SFP only, EX Series switches, and MX series routers with Channelized OC3/STM1 Circuit Emulation PIC with SFP only using container interfaces) Reduce the Automatic Protection Switching (APS) switchover time in Layer 2 circuits.

NOTE:

- The fast APS switching feature is supported only within a single chassis on a MX series router using a container interface.
- Configuring this statement reduces the APS switchover time only when the Layer 2 circuit encapsulation type for the interface receiving traffic from a Layer 2 circuit neighbor is SAToP.
- When the `fast-aps-switch` statement is configured in revertive APS mode, you must configure an appropriate value for revert time to achieve reduction in APS switchover time.
- To prevent the logical interfaces in the data path from being shut down, configure appropriate hold-time values on all the interfaces in the data path that support TDM.
- The `fast-aps-switch` statement cannot be configured when the APS `annex-b` option is configured.
- The interfaces that have the `fast-aps-switch` statement configured cannot be used in virtual private LAN service (VPLS) environments.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1.

fast-lookup-filter

IN THIS SECTION

- Syntax | 6928
- Hierarchy Level | 6928
- Description | 6928
- Required Privilege Level | 6929
- Release Information | 6929

Syntax

```
fast-lookup-filter;
```

Hierarchy Level

```
[edit firewall family family-name filter filter-name],
[edit logical-systems logical-system-name firewall family family-name filter filter-name]
```

Description

The `fast-lookup-filter` is available for the inet and inet6 protocol families for both static and dynamic profiles. Junos installs firewall filters created under this hierarchy to the accelerated filter block available in the certain MPCs, which provides enhanced performance.

Juniper recommends that you use the `payload-protocol` term rather than the `next-header` term when configuring a firewall filter with match conditions for IPv6 traffic. Although either can be used, `payload-protocol` provides the more reliable match condition because it uses the actual payload protocol to find a match, whereas `next-header` simply takes whatever appears in the first header following the IPv6 header, which may or may not be the actual protocol. In addition, if `next-header` is used with IPv6, the accelerated filter block lookup process is bypassed and the standard filter used instead.

See *Firewall Filter Match Conditions for IPv6 Traffic* for more information about firewall filters and terms.

Fast lookup filters can boost filtering performance by as much as three to four times for filters under 3000 terms. Firewall instances from the same firewall block can also be attached to multiple interfaces.

Required Privilege Level

firewall—To view this statement in the configuration.

firewall-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.3R3 for MX 240, MX 480, MX 960, MX 2010, and MX 2020 routers with MPC5E, MPC5EQ, or MPC6E, and later for MPC7E, MPC8E, and MPC9E MPCs.

Support for the `next-header` firewall match condition was added in Junos OS Release 13.3R6

Support for MPC2E-NG and MPC3E-NG MPCs was added in Junos OS Release 15.1R1.

Change History Table

Feature support is determined by the platform and release you are using. Use Feature Explorer to determine if a feature is supported on your platform.

Release	Description

fast-lookup-filter (PTX)

IN THIS SECTION

- Syntax | 6930
- Hierarchy Level | 6930
- Description | 6930
- Required Privilege Level | 6935
- Release Information | 6935

Syntax

```
fast-lookup-filter
```

Hierarchy Level

```
[edit firewall family family-name filter output filter-name],
[edit logical-systems logical-system-name firewall family family-name filter output filter-name]
```

Description

On PTX platforms, the `fast-lookup-filter` (FFT) is available on Inet, Inet 6, Ethernet-Switching, Any, MPLS (no MPLS `label` match support) and CCC firewall filter families. Using `fast-lookup-filter` on output filters prioritizes the filters for fast processing. Applying the `fast-lookup-filter` configuration on output firewall filters, programs the firewall filters on the fast-lookup-filter block on the device, to enable high-speed line-rate (2 billion packets-per-second) processing of the firewall filters in the egress direction.

NOTE: It is mandatory to set the fast-lookup-filter knob to apply the family mpls output filter.

On PTX platforms, only the following firewall filter match conditions and actions are supported for fast look filters.

Table 40: Supported firewall filter match conditions for fast lookup filters on PTX platforms

accept	Yes
discard	Yes
reject	Yes
count	Yes
forwarding-class	Yes

Table 41: Supported firewall filter actions for fast lookup filters on PTX platforms *(Continued)*

CLI	Supported?
traffic-class	No
loss-priority	Yes
policer	Yes
sample	Yes
syslog	Yes

NOTE:

- Only 8 unique firewall filters per PFE are supported across all supported firewall filter families.
- Fast lookup is applicable only for output filters.
- Unsupported firewall filter matches and actions is processed from the default processing pipeline, and not programmed on the fast-lookup-filter block.
- Fast lookup filters are limited to 4096 rules of 96 bits or 2048 rules of 192 bits or 1024 rules of 384 bits.
- Maximum 256 logical interface (IFL) bindings for interface specific filter per PFE.
- The `fast-lookup-filter` configuration cannot be applied on input filters.
- There is no support for split filter or filter chaining.
- The `fast-lookup-filter` configuration cannot be used to prioritize amongst the 8 unique fast lookup filters.
- Fast lookup filters do not support slow counters. Counter scale is limited to 48 thousand counter per PFE (Packet Forwarding Engine).

Required Privilege Level

firewall—To view this statement in the configuration.

firewall-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Evolved 23.1 R1 for PTX platforms.

RELATED DOCUMENTATION

fast-lookup-filter

fast-lookup-tuple

IN THIS SECTION

- Syntax | 6935
- Hierarchy Level | 6935
- Description | 6936
- Default | 6936
- Required Privilege Level | 6936
- Release Information | 6937

Syntax

```
fast-lookup-tuple
```

Hierarchy Level

```
[edit firewall family inet filter firewall filter name term term name from]
```

Description

Use `fast-lookup-tuple` for better firewall filter processing performance by matching exact values of the five tuple or five combined match conditions. It enables high scale firewall filter performance improvement with only 5-tuple configurations per term without range configurations by avoiding execution of multiple terms in sequence. You can also use `fast-lookup-tuple-list` to match five tuple list template defined under policy options.

`fast-lookup-tuple` is only for INET firewall filter family. No range of values is supported for each of the 5-tuple fields. `fast-lookup-tuple` can be applied at all bind points including chain filters, list filters, and nested filters. Next-term action is not supported for `fast-lookup-tuple` match. `fast-lookup-tuple` cannot be defined for fast lookup filters.

The following is a sample configuration.

```
set firewall family inet filter f1 term t1 from fast-lookup-tuple
10.11.12.13:20.21.22.23:17:168:65535
```

Default

l3 byte value - `<dest-ip-in-regular-format>:<src-ip-in-regular-format>:<proto>:<src-port>:<dest-port>`

- `<dest-ip-in-regular-format>`: Destination IP address as <a.b.c.d>. Where a, b, c and d are in decimal values. Example: 10.11.12.13 as standard IP notation.
- `<src-ip-in-regular-format>`: Source IP address as <a.b.c.d>. Where a, b, c and d are in decimal values. Example: 10.12.13.14 as standard IP notation.
- `<proto>`: Single byte protocol value in decimal format. Note - Standard protocol names are not allowed for protocol value.
- `<src-port>`: Two bytes port values in decimal format.
- `<dest-port>`: Two bytes port values in decimal format.

Required Privilege Level

firewall—To view this statement in the configuration.

firewall-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos 24.2 on MX platforms

fast-lookup-tuple-list

IN THIS SECTION

- Syntax | 6937
- Hierarchy Level | 6937
- Description | 6937
- Default | 6938
- Required Privilege Level | 6938
- Release Information | 6938

Syntax

```
fast-lookup-tuple-list list name
```

Hierarchy Level

```
[edit firewall family inet filter firewall filter name term term name from]
```

Description

Match any of the list of 5-tuple (fast-lookup-tuple) combinations. The list is defined under policy options.

`fast-lookup-tuple-list` is only for INET firewall filter family. No range of values is supported for each of the 5-tuple fields. `fast-lookup-tuple-list` can be applied at all bind points including chain filters, list filters, and nested filters.

The following is an example of a configuration.

```
set policy-options fast-lookup-tuple-list five-tuple-list 10.11.12.13:20.21.22.23:17:168:65535
```

Default

`fast-lookup-tuple-list` *`list name`* - the name of the list of 5-tuple combinations defined under policy options.

Required Privilege Level

firewall—To view this statement in the configuration.

firewall-control—To add this statement to the configuration.

Release Information

fast-poe

IN THIS SECTION

- Syntax | 6940
- Hierarchy Level | 6940

- Release Information | 6940
- Description | 6940
- Required Privilege Level | 6940

Syntax

```
fast-poe;
```

Hierarchy Level

```
[edit poe]
```

Release Information

Statement introduced in Junos OS Release 21.1.

Description

Fast Power over Ethernet (fast PoE) delivers PoE power to devices connected to the ports even before the switch is fully operational. This is beneficial when the connected devices need only power, and not network connectivity.

> **NOTE**: Fast PoE is disabled if and when you issue commands to zeroize the switch, do a USB install, or load the factory default.

Required Privilege Level

system

fast-reroute-priority

IN THIS SECTION

- Syntax | 6941
- Hierarchy Level | 6941
- Description | 6941
- Default | 6942
- Options | 6942
- Required Privilege Level | 6942
- Release Information | 6942

Syntax

```
fast-reroute-priority (high | low | medium);
```

Hierarchy Level

```
[edit forwarding-options]
[edit logical-systems logical-system-name routing-instances routing-instance-name forwarding-
options],
[edit routing-instances routing-instance-name forwarding-options]
```

Description

Specify the fast reroute priority for a VPLS routing instance. You can configure `high`, `medium`, or `low` fast reroute priority to prioritize specific VPLS routing instances for faster convergence and traffic restoration. Because the router repairs next hops for high-priority VPLS routing instances first, the traffic traversing a VPLS routing instance configured with `high` fast reroute priority is restored faster than the traffic for VPLS routing instances configured with `medium` or `low` fast reroute priority.

NOTE: In the VPLS documentation, the word *router* in terms such as *PE router* is used to refer to any device that provides routing functions.

Default

`low`

Options

`high`—Set the fast reroute priority for a VPLS routing instance to high. During a fast reroute event, the router repairs next hops for high-priority VPLS routing instances first.

`low`—Set the fast reroute priority for a VPLS routing instance to low, which is the default. During a fast reroute event, the router repairs next hops for low-priority VPLS routing instances last.

`medium`—Set the fast reroute priority for a VPLS routing instance to medium. During a fast reroute event, the router repairs next hops for medium-priority VPLS instances after high-priority VPLS routing instances but before low-priority VPLS routing instances.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.5.

[edit logical-systems logical-system-name routing-instances routing-instance-name routing-
options],
[edit routing-options],
[edit routing-instances routing-instance-name routing-options]
```

Description

Specify a backup path in case the primary path becomes unusable.

You specify one or more objects with common characteristics within a group. All objects are treated as /32 host addresses. The objects can be a LAN interface, a router ID, or a point-to-point link. Sequence is insignificant.

Changing the fate-sharing database does not affect existing established LSPs until the next CSPF reoptimization. The fate-sharing database does affect fast-reroute detour path computations.

Options

`cost` *`value`*—Cost assigned to the group.

- **Range:** 1 through 65,535
- **Default:** 1

`from` *`address`*—Address of the router or address of the LAN/NBMA interface. For example, an Ethernet network with four hosts in the same fate-sharing group would require you to list all four of the separate `from` addresses in the group.

`group` *`group-name`*—Each fate-sharing group must have a name, which can have a maximum of 32 characters, including letters, numbers, periods (.), and hyphens (-). You can define up to 512 groups.

`to` *`address`*—(Optional) Address of egress router. For point-to-point link objects, you must specify both a `from` and a `to` address.

use-for-post-convergence-lfa—Use this fate-sharing group as a constraint for the backup path computed by topology-independent loop-free alternate (TI-LFA).

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

QFX Series that Support FCoE-FC Gateway Configuration

```
[edit fc-fabrics fc-fabric-name protocols fip]
```

Description

Set the FCoE mapped address prefix (FC-MAP) value for the FCoE VLAN to match the FC switch (or FCoE forwarder) FC-MAP value for the FC fabric. The FC-MAP value is a unique MAC address prefix an FC switch uses to identify FCoE traffic for a given FC fabric (traffic on a particular FCoE VLAN).

You can configure the FC-MAP value or use the default value. The default FC-MAP value is different for VN_Port to VF_Port (VN2VF_Port) FIP snooping (0x0EFC00) than for VN_Port to VN_Port (VN2VN_Port) FIP snooping.

The FC switch provides the FC-MAP value to FCoE nodes (ENodes) in the FIP discovery advertisement message. If the EX Series switch or the QFX Series FCoE VLAN FC-MAP value does not match the FC switch FC-MAP value, neither device discovers the FC switch on that VLAN, and the ENodes on that VLAN cannot access the FC switch. The FC switch accepts only FCoE traffic that uses the correct FC-MAP value as part of the VN_Port MAC address.

When the QFX Series acts as an FCoE-FC gateway, the FC-MAP value for the gateway and the FCoE devices must match the FC switch FC-MAP value in order to communicate with the FC switch.

> **NOTE**: Changing the FC-MAP value causes all logins to drop and forces the ENodes to log in again.

Options

fc-map-value—FC-MAP value, hexadecimal value preceded by “0x”.

- **Range:** 0x0EFC00 through 0x0EFCFF
- **Default:** 0x0EFC00 for VN2VF_Port FIP snooping

  0x0EFD00 for VN2VN_Port FIP snooping

- Release Information | 6963

Syntax

```
fcoe {
    no-auto-negotiation;
}
```

Hierarchy Level

```
[edit protocols dcbx interface interface-name applications]
```

Description

Disable advertising the FCoE state of the interface to the peer. To disable FCoE on the interface, do not configure the FCoE forwarding class on the interface.

Options

no-auto-negotiate—Disable automatic negotiation of FCoE capability.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.1.

fcoe-lag

IN THIS SECTION

- Syntax | 6963
- Hierarchy Level | 6963
- Description | 6964
- Required Privilege Level | 6964
- Release Information | 6964

Syntax

```
fcoe-lag;
```

Hierarchy Level

```
[edit interfaces lag-interface-name aggregated-ether-options]
```

Description

Configure a special link aggregation group (LAG) to transport Fibre Channel over Ethernet (FCoE) traffic and regular Ethernet traffic across the same link aggregation bundle.

An FCoE LAG ensures that FCoE traffic uses the same link within a LAG to transmit and receive information between an FCoE device and a Fibre Channel (FC) SAN switch across a QFabric system Node device. This preserves the point-to-point link emulation that FC requires. A standard LAG uses a hashing algorithm to determine the LAG link used for each communication, so with a standard LAG, you cannot guarantee that communication between an FCoE device and the QFabric system Node device always uses the same link. If communication between the FCoE device and the QFabric system Node device uses different physical links, the SAN terminates the link.

An FCoE LAG treats regular Ethernet traffic (traffic that is not FCoE traffic) in the same way as on a standard LAG, providing link redundancy and load-balancing for the regular Ethernet traffic. An FCoE LAG does not provide link redundancy or load balancing for FCoE traffic.

On FCoE-FC gateways, if the gateway has one or more untrusted FC fabrics, you must also disable FIP snooping scaling on the gateway by including the `no-fip-snooping-scaling` option in the `[edit fc-options]` hierarchy.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2X52-D10.

```

ELS CLI for Platforms that Support FCoE

```
[edit vlans vlan-name forwarding-options fip-security interface interface-name]
```

NOTE: The `fcoe-trusted` configuration statement is in a different hierarchy on the original CLI than on the Enhanced Layer 2 Software (ELS) CLI.

QFX Series that Support FCoE-FC Gateway Configuration

```
[edit fc-fabrics fc-fabric-name protocols fip]
```

Description

Configure the specified 10-Gigabit Ethernet interface to trust Fibre Channel over Ethernet (FCoE) traffic. If an interface is connected to another switch such as an FCoE forwarder (FCF) or a transit switch, you can configure the interface as trusted so that the interface forwards FCoE traffic from the switch to the FCoE devices without installing FIP snooping filters.

(QFX Series FCoE-FC gateway) Configure the specified local Fibre Channel fabric to trust FCoE traffic on all ports in the fabric. Changing the fabric ports from untrusted to trusted removes any existing FIP snooping filters from the ports. Changing the fabric ports from trusted to untrusted by removing the `fcoe-trusted` configuration from the fabric forces all of the FCoE sessions on those ports to log out so that when the ENodes and VN_Ports log in again, the switch can build the appropriate FIP snooping filters.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.4.

Statement introduced for the FC fabric in Junos OS Release 11.3 for the QFX Series.

Statement introduced for the ELS CLI in Junos OS Release 13.2 for the QFX Series.

Hierarchy Level

```
[edit security utm default-configuration]
[edit security utm]
```

Description

Configure Content Security features, antivirus, antispam, content-filtering, and web-filtering by creating feature profiles.

Options

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Starting in Junos OS Release 21.4R1, content evaluation is based of the file content. The file type-based evaluation of content is deprecated and the related configurations are hidden. So, the content filtering options in this hierarchy is deprecated and not supported from Junos OS Release 21.4R1.

You can use the legacy functionality if you do not want to migrate to enhanced content filtering functionality. You will be allowed to use the legacy configurations, but all the legacy configuration knobs are deprecated and hidden. Also, you will receive system logs and error message warnings when you use the legacy configuration options.

The Kaspersky, Express antivirus and Surf-Control features are not supported from Junos OS Release 15.1X49-D10 onwards. For previous releases, statement introduced in Release 9.5.

Starting with Junos OS Release 18.2R1, the following commands under the `[edit security utm feature-profile]` hierarchy level are deprecated:

- `set web-filtering type`

- `set web-filtering url-blacklist`
- `set web-filtering url-whitelist`
- `set web-filtering http-persist`
- `set web-filtering http-reassemble`
- `set web-filtering traceoptions`
- `set web-filtering juniper-enhanced cache`
- `set web-filtering juniper-enhanced reputation`
- `set web-filtering juniper-enhanced query-type`
- `set anti-virus mime-whitelist`
- `set anti-virus url-whitelist`
- `set anti-virus type`
- `set anti-virus traceoptions`
- `set anti-virus sophos-engine`
- `set anti-spam address-blacklist`
- `set anti-spam address-whitelist`
- `set anti-spam traceoptions`
- `set content-filtering traceoptions`

`no-safe-search` option added for Websense redirect and Juniper local in Junos OS Release 20.2R1.

```

Hierarchy Level (ACX6360, ACX5448-D)

```
[edit interfaces interface-name optics-options]
```

Description

Enable forward error correction (FEC) mode.

Default

If you do not specify a mode, the default mode is `gfec`. On PTX Series routers with P1-PTX-2-100G-WDM, the default value is `gfec-sdfec`. On PTX Series routers with PTX-5-100G-WDM and on MX Series routers with MIC3-100G-DWDM, the default value is `sdfec`.

Options

efec—(M Series, MX Series routers and PTX Series routers only) G.975.1 I.4 enhanced forward error correction (EFEC) is configured to detect and correct bit errors. This mode is supported only on 10G ports and not supported on the 40G and 100G ports.

gfec—(M series, MX Series routers and PTX Series routers only) G.709 generic forward error correction (GFEC) mode is configured to detect and correct bit errors.

gfec-sdfec—(PTX Series routers only) GFEC and soft-decision forward error correction (SD-FEC) modes are configured to detect and correct bit errors.

hgfec—(MX Series routers only) High gain forward error correction mode is configured to detect and correct bit errors.

sdfec—(MX Series routers, PTX Series routers, and ACX6360 routers only) Sky-Compatible Soft-decision forward error correction mode is configured to detect and correct bit errors.

sdfec15—(ACX6360 routers only) Soft Decision Forward Error Correction with 15 percent overhead is configured to detect and correct bit errors.

none—(M Series and MX Series routers only) FEC mode is not configured.

NOTE: On MX Series routers with MIC3-100G-DWDM and PTX Series routers with PTX-5-100G-WDM, none option is not supported. The `fec` mode must be enabled on the MIC3-100G-DWDM MIC and the PTX-5-100G-WDM PIC.

ufec—(MX Series routers and PTX Series routers only) G.975.1 I.7 Ultra Forward Error Correction (UFEC) mode is configured to detect and correct bit errors. This mode is supported only on 10G ports and not supported on the 40G and 100G ports.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

```

Description

(PTX10001-36MR, PTX10003-8T, PTX10003-16T, PTX10004, PTX10008, QFX5220-32CD, and QFX5220-128C) Enable or disable RS-FEC (Reed-Solomon Forward Error Correction) for 25, 50, 100, 400-Gigabit Ethernet interface. By default, the Junos OS software enables or disables forward error correction based on the plugged-in optics. For instance, Junos OS software enables RS-FEC for 25G or 50G SR4 optics and disables RS-FEC for 25G or 50G LR4 optics.

If you enable or disable RS-FEC using this statement, this behavior applies to any 25-Gigabit Ethernet or 50-Gigabit Ethernet optical transceiver installed in the port associated with the interface.

You can configure forward error correction (FEC) clauses CL74 on 25-Gigabit and 50-Gigabit interfaces, and CL91 on 25-Gigabit or 50-Gigabit interfaces. Since the FEC clauses are applied by default on these interfaces, you must disable the FEC clauses if you do not want to apply them.

FEC mode is assigned by default. If there is a FEC mismatch, the link between nodes can go down. You must disable FEC mode if you do not want it assigned by default.

To view the FEC mode on an interface, use the `show interfaces interface-name` command.

For instance, consider two peer nodes, Node1 and Node2. Node1 is currently running Junos OS Evolved release 21.1R1 and the peer node (Node2) is currently running any Junos OS Evolved release prior to 21.1R1. The link between the two nodes will go down because of FEC mismatch. To enable the link to come back up, you must manually change the FEC on any one node by using the `fec` option at the `[edit interfaces <interface-name> ether-options]` hierarchy level.

Default FEC for prior to 21.1 Junos OS Evolved 21.1 is FEC74 and from 21.1 Junos OS Evolved is FEC91.

When FEC mode is FEC74 or FEC91 or NONE for all channels, FEC gets locked and interface is UP. For example, when FEC91 is configured together with FEC74 or NONE, on channel-0 and 1 or channel-2 and 3, link goes down for both channels.

Table 42: Link status for FEC combination of channel 2 and 3

Physical channel 0 (2)	Physical channel 1 (3)	Link Status
FEC74	FEC74	UP
FEC91	FEC91	UP
NONE	NONE	UP
FEC74	NONE	UP
NONE	FEC74	UP
FEC74	FEC91	DOWN

FEC91	FEC74	DOWN
FEC91	NONE	DOWN
NONE	FEC91	DOWN

There is no dependency between Channel 0(1) and channel 2(3). FEC74 can be configured with NONE to any interface et-x/y/x:(0/1/2/3) and link comes UP leads to the following:

- When you configure FEC91 on interface-x/y/z:0 then you must configure FEC91 on interface- x/y/z:1.
- When you configure FEC91 on interface-x/y/z:2 then you must configure FEC91 on interface- x/y/z:3.
- When you configure FEC74 or NONE on interface-x/y/z:0/1 then you must configure FEC74 or NONE on interface- x/y/z:2/3.

Options

fec108 IEEE 802.3by Clause 108, Reed-Solomon FEC (RS-FEC) on 25g links

fec74 FEC74 enabled

fec91 IEEE 802.3bj Clause 91, Reed-Solomon FEC (RS-FEC)

none FEC disabled

Default

Junos OS software automatically enables or disables 25-Gigabit Ethernet and 50-Gigabit Ethernet for FEC91 based on the type of pluggable optics used.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.1R1

(ACX6360-OX Transponders, ACX6360 routers, MX Series Routers with MPC7E, MPC8E, and MPC9E, MX10003 Router with MX10003 MPC, MX204 Router, PTX1000, FPC3-PTX-U2 and FPC3-PTX-U3 on PTX5000, and QFX series switches) Enable or disable Reed-Solomon Forward Error Correction (RS-FEC) for a 100-Gigabit Ethernet interface. By default, the Junos OS software enables or disables FEC based on the plugged-in optics. For example, Junos OS enables RS-FEC for 100GbE SR4 optics and disables RS-FEC for 100GbE LR4 optics.

This statement allows you to override the default behavior and explicitly enable or disable RS-FEC. For example, you can extend the reach of 100GbE LR4 optics when you explicitly enable RS-FEC for the optics. RS-FEC is compliant with IEEE 802.3-2015 Clause 91.

Once you enable or disable RS-FEC using this statement, this behavior applies to any 100-Gigabit Ethernet optical transceiver installed in the port associated with the interface.

You can configure forward error correction (FEC) clauses CL74 on 25-Gigabit and 50-Gigabit interfaces, and CL91 on 100-Gigabit interfaces. Since the FEC clauses are applied by default on these interfaces, you must disable the FEC clauses if you do not want to apply them.

> **NOTE**: FPC-PTX-P1-A and FPC2-PTX-P1A on PTX5000 routers do not support RS-FEC. FPC3-SFF-PTX-1H and FP3-SFF-PTX-1T with PE-10-U-QSFP28 PIC and LR4 optics on PTX3000 and PTX5000 routers supports RS-FEC only on port 2. For PE-10-U-QSFP28 with LR4 optics, RS-FEC is the default FEC mode on port 2 and NONE is the default FEC mode on ports 0,1,3 through 9. For PE-10-U-QSFP28 with SR4 optics, RS-FEC is enabled by default on all ports. Do not modify the FEC mode on any port irrespective of the optics installed.

To check the FEC status, use the `show interfaces` *`interface-name`* command.

Default

Junos OS software automatically enables or disables RS-FEC based on the type of pluggable optics used.

Options

fec91 Enables RS-FEC. RS-FEC is compliant with IEEE 802.3-2015 Clause 91.

fec74 Enables RS-FEC. RS-FEC is compliant with IEEE 802.3-2015 Clause 74.

none Disables RS-FEC.

feeds (T640, T1600, and T4000 Routers with Six-Input DC Power Supply)

IN THIS SECTION

- Syntax | 7001
- Hierarchy Level | 7001
- Description | 7002
- Options | 7002
- Required Privilege Level | 7002
- Release Information | 7002

Syntax

```
feeds number-of-input-feeds;
```

Hierarchy Level

```
[edit chassis pem],
[edit chassis lcc lcc-number pem]
```

Description

Configure the number of input feeds connected to the six-input DC power supply on T640, T1600, or T4000 routers. The value assigned to the `feeds` statement must be equal to the number of input feeds provided to the power supply.

When providing four or five input feeds on standalone routers, you must configure the `feeds` statement at the `[edit chassis pem]` hierarchy level. When providing four or five input feeds to an LCC router in a routing matrix, you must configure the `feeds` statement at the `[edit chassis lcc` *`lcc-number`* `pem]` hierarchy level.

NOTE:

- Before configuring input feeds for your router, see the *T640 Core Router Hardware Guide*, *T1600 Core Router Hardware Guide*, or *T4000 Core Router Hardware Guide* for special considerations and for the number of input feeds supported by the router.
- All power supplies in the router must use the same number of inputs feeds.

Options

- **Range:** 4 through 6
- **Default:** 6

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.1.

fib-install-priority

IN THIS SECTION

- Syntax (PTX10001-36MR, PTX10004, PTX10008, PTX10016 Devices) | 7003
- Hierarchy Level | 7003
- Description | 7003
- Options | 7004
- Required Privilege Level | 7004
- Release Information | 7004

Syntax (PTX10001-36MR, PTX10004, PTX10008, PTX10016 Devices)

```
fib-install-priority <high/medium/>
```

Hierarchy Level

```
[edit policy-options policy-statement policy-name term term-name then]
```

Description

Assign a FIB install priority, as high or low, for matching routes. Non-matching routes are by default classified as unprioritized. When the routes are installed in the forwarding table, the number of forwarding table entries that routes of a particular priority get depends on the memory percentage allotted for the priority. Refer "fib-prioritization" on page 7007 to read more.

Issue the `run show route <prefix> extensive` command as shown in the following example to view the FIB install priority of a particular route.

```
user@host# run show route 10.0.1.1 extensive

inet.0: 33 destinations, 35 routes (33 active, 0 holddown, 0 hidden)
10.0.1.1/32 (1 entry, 1 announced)
TSI:
```

```
KRT in-kernel 10.0.1.1/32 -> {10.1.2.1}
   *Static Preference: 5
       FIB Installation Priority: INSTALL PRIORITY MEDIUM
       Next hop type: Router, Next hop index: 11045
       Address: 0x55eaafc82f1c
       Next-hop reference count: 3, key opaque handle: (nil), non-key opaque handle: (nil)
       Next hop: 10.1.2.1 via et-0/0/3.0, selected
       Session Id: 9
       State: <Active Int Ext>
       Local AS:100
       Age: 26
       Validation State: unverified
       Task: RT
       Announcement bits (1): 0-KRT
       AS path: I
       Thread: junos-main
```

Options

- high – Set the FIB install priority as high.
- medium – Set the FIB install priority as medium.

Required Privilege Level

- interface—To view this statement in the configuration.
- interface-control—To add this statement to the configuration.

Release Information

Command support introduced in Junos OS Evolved Release 22.4R1 for the PTX Series.

fib-local

IN THIS SECTION

- Syntax | 7005
- Hierarchy Level | 7005
- Description | 7005
- Required Privilege Level | 7005
- Release Information | 7006

Syntax

```
fib-local;
```

Hierarchy Level

```
[edit chassis fpc fpc-number route-localization]
```

Description

Configure the Packet Forwarding Engine on an FPC as FIB-local.

NOTE: At least, one Packet Forwarding Engine must be configured as **fib-local** for the commit operation to be successful. If you do not configure **fib-local** for the Packet Forwarding Engine, the CLI displays an appropriate error message and the commit fails.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.4.

fib-next-hop-split

IN THIS SECTION

- Syntax | 7006
- Hierarchy Level | 7006
- Description | 7007
- Options | 7007
- Required Privilege Level | 7007
- Release Information | 7007

Syntax

```
fib-next-hop-split {
    labeled-isis;
}
```

Hierarchy Level

```
[edit routing-options forwarding-table]
```

Description

You must configure the `fib-next-hop-split` statement in conjunction with the "egress-chaining" on page 6210 and "transit" on page 30066 statements to enable route resolution over labeled IS-IS routes using flattened router next hops. Configuring the `fib-next-hop-split` statement alone does not have any effect.

When you configure the `no-labeled-isis` statement at the `[edit routing-options forwarding-table chained-composite-next-hop transit]` hierarchy level, the labeled IS-IS routes are flattened to ensure that the segment routing traffic-engineering (SPRING-TE) routes are not resolved any further over another composite next hop.

Options

labeled-isis Create composite-chained next hops for labeled IS-IS routes.

In addition to enabling `fib-next-hop-split`, you can also configure "egress-chaining" on page 6210 to reduce the number of chained next hops present in a route that involves resolution over multiple routes with labels.

Required Privilege Level

routing

Release Information

Statement introduced in Junos OS Release 20.4R1.

RELATED DOCUMENTATION

egress-chaining | **6210**

fib-prioritization

IN THIS SECTION

Syntax (PTX10001-36MR, PTX10004, PTX10008, PTX10016 Devices) | **7008**

- Hierarchy Level | 7008
- Description | 7008
- Options | 7009
- Required Privilege Level | 7009
- Release Information | 7009

Syntax (PTX10001-36MR, PTX10004, PTX10008, PTX10016 Devices)

```
chassis {
    fib-prioritization {
        high-priority-memory-percent 0...100
        medium-priority-memory-percent 0...100
    }
}
```

Hierarchy Level

```
[edit chassis]
```

Description

Configure the memory allocation percent to install high and medium priority routes in the Forwarding Information Base (FIB) at device level. Reserve a percentage of memory on chassis for high-priority and medium priority routes, for IPv4, IPv6, and MPLS, BGP, IGP, static, aggregate, generated, and PRPD routes protocol data. The FIB prioritization configuration is a system-wide configuration. The amount of high or medium priority routes supported are different, based on memory available on the FPCs. Please note, that the system must be rebooted every time the FIB prioritization is changed.

```
chassis {
    fib-prioritization {
        high-priority-memory-percent 50
        medium-priority-memory-percent 30
    }
}
```

> **NOTE**: Total value of high priority and medium priority percentage must not exceed 100

Options

fib-prioritization—FIB prefix prioritization to install high and medium priority routes at chassis-level.

- high-priority-memory-percent – Memory allocation for high priority protocol routes. Value range for memory percent is 0 to 100.
- medium-priority-memory-percent – Memory allocation for medium priority protocol routes. Value range for memory percent is 0 to 100.

```

Description

Archive files from the device, copy files to and from the router or switch, calculate the file checksum, compare files, delete a file from the device, list files on the device, rename a file, show file contents, or show the local address to initiate a connection.

Options

archive (Optional)	Archive, and optionally compress, one or multiple local system files as a single file, locally or at a remote location.
change-owner (Optional)	Change owner of file.
change-permission (Optional)	Change permission of file.
checksum (Optional)	Calculate the Message Digest 5 (MD5) checksum of a file.

compare (Optional)	Compare two local files and describe the differences between them in default, context, or unified output styles.
Compress (Optional)	file compress.
copy (Optional)	Copy files from one place to another on the local device or between the local device and a remote system.
delete (Optional)	Delete a file on the local device.
delete-directory (Optional)	Delete a directory.
link (Optional)	Create link between files.
list (Optional)	Display a list of files on the local device.
make-directory (Optional)	Create a new directory.
rename (Optional)	Rename a file on the local device.
routing-instance (Optional)	Name of routing instance for host attempt.
show (Optional)	Display the contents of a file.
source-address (Optional)	Specify the source address of the local file.
staging-directory (Optional)	Staging directory on Routing Engine.

Required Privilege Level

maintenance

Release Information

Command introduced before Junos OS Release 7.4.

file (Security Certificates)

IN THIS SECTION

- Syntax | 7027
- Hierarchy Level | 7027
- Description | 7027
- Options | 7027
- Required Privilege Level | 7027
- Release Information | 7028

Syntax

```
file certificate-filename;
```

Hierarchy Level

```
[edit security certificates certification-authority ca-profile-name]
```

Description

(Encryption interface on M Series and T Series routers and EX Series switches only) Specify the file from which to read the digital certificate.

Options

certificate-filename—File from which to read the digital certificate.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Specifying a File to Read the Digital Certificate

file (Analytics)

IN THIS SECTION

- Syntax | 7028
- Hierarchy Level | 7029
- Description | 7029
- Default | 7029
- Options | 7029
- Required Privilege Level | 7030
- Release Information | 7030

Syntax

```
file filename {
    files number-of-files;
    size size;
}
```

Hierarchy Level

```
[edit services analytics collector local]
[edit services analytics queue-statistics]
[edit services analytics traffic-statistics]
```

Description

Enable the logging of queue or traffic monitoring statistics in a local file. This statement does not enable monitoring.

Default

This feature is disabled by default.

Options

filename Specify a filename for storing queue and traffic monitoring statistics in the Comma-separated Values (CSV) format. The file is stored in the **/var/log/** directory of your device.

If you do not specify a filename, the data is not stored in a file.

> **NOTE**: In Junos OS Release 13.2X51-D15 or later, you configure a single filename to store both queue and traffic monitoring statistics. In Junos OS Release 13.2X51-D10 and earlier, you configure separate files for storing monitoring data, one for queue statistics, and another for traffic statistics.

files ***number-of-files*** Specify the number of files to store locally. After the number of files with the maximum file size is reached, the system starts over and writes the data to the first file.

- **Range:** 2 to 1,000 files.

size ***size*** Configure the file size in megabytes (MB).

- **Syntax:** *xm* to specify MB.
- **Range:** 10 to 4095 MB

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.2.

Change History Table

Feature support is determined by the platform and release you are using. Use Feature Explorer to determine if a feature is supported on your platform.

Release	Description
13.2X51-D15	In Junos OS Release 13.2X51-D15 or later, you configure a single filename to store both queue and traffic monitoring statistics.
13.2X51-D10	In Junos OS Release 13.2X51-D10 and earlier, you configure separate files for storing monitoring data, one for queue statistics, and another for traffic statistics.

Network Analytics Overview

file (App Engine Virtual Machine Management Service)

IN THIS SECTION

- Syntax | 7031
- Hierarchy Level | 7031
- Description | 7031
- Options | 7031
- Required Privilege Level | 7032
- Release Information | 7032

Syntax

```
file {filename <files number> | match | no-world-readable | size size | world-readable
}
```

Hierarchy Level

```
[edit system processes app-engine-virtual-machine-management-service traceoptions]
```

Description

Trace file information for the Virtual Machine Management Daemon (vmmd), which communicates with the host OS.

Options

filename Name of the file in which the trace information is stored. By default, the file is created in the **/var/log** directory.

files *number* (Optional) Maximum number of trace files. When a trace file reaches the size specified by the `size` option, the filename is appended with 0 and compressed. For example, when a trace file named trace-file-log reaches size *size*, it is compressed and renamed as trace-file-log.0.gz. When trace-file-log reaches size *size* for the second time, trace-file-log.0.gz is renamed as trace-file-log.1.gz and trace-file-log is compressed and renamed as trace-file-log.0.gz. This renaming sheme ensures that the older logs have a greater index number. When number of trace files reaches *number*, the oldest file is deleted.

If you specify a maximum number of files, you also must specify a maximum file size with the `size` option and a filename.

- **Range:** 2 through 1000
- **Default:** 10

match Refine the output to include only those lines that match the given regular expression.

no-world-readable Restrict file access to the user who created the trace files.

size*size* Maximum size of each trace file . By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes

(MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the files option.

- **Range:** 10 KB through 1 GB
- **Default:** 128 KB

`world-readable` Enable unrestricted file access.

Required Privilege Level

system-control

Release Information

Statement introduced in Junos OS Release 15.1F3.

> **NOTE**: PTX3000 router supports the Routing and Control Board, RCBPTX.

file archive

IN THIS SECTION

- Syntax | 7033
- Description | 7033
- Options | 7033
- Required Privilege Level | 7034
- Output Fields | 7034

Sample Output | 7034
Release Information | 7035

Syntax

```
file archive destination destination source source
<compress>
<exclude> filepattern
<routing-instance>
<source-address>
```

Description

Archive, and optionally compress, one or multiple local system files as a single file, locally or at a remote location.

For information on valid filename and URL formats, see *Format for Specifying Filenames and URLs in Junos OS CLI Commands*.

Options

destination *destination*	Destination of the archived file or files. Specify the destination as a URL or filename. The Junos OS adds one of the following suffixes if the destination filename does not already have it: • For archived files—The suffix **.tar** • For archived and compressed files—The suffix **.tgz**
source *source*	Source of the original file or files. Specify the source as a URL or filename.
compress	(Optional) Compress the archived file with the GNU zip (gzip) compression utility. The compressed files have the suffix **.tgz**.
exclude	(Optional) Specify the file pattern to exclude. `exclude` helps to exclude files that delay compression or files that need not be compressed.
routing-instance *routing-instance-name*	(Optional) Name of the routing-instance.

source-address *address* (Optional) Local address to use in originating the connection.

Required Privilege Level

maintenance

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

file archive (Multiple Files)

The following sample command archives all messages files in the local directory `/var/log/` as the single file `messages-archive.tar`.

```
user@host> file archive source /var/log/messages* destination /var/log/messages-archive.tar
/usr/bin/tar: Removing leading / from absolute path names in the archive.

user@host>
```

file archive (Single File)

The following sample command archives a single messages file in the local directory `/var/log/` as the single file `messages-archive.tar`.

```
user@host> file archive source /var/log/messages destination /var/log/messages-archive.tar
/usr/bin/tar: Removing leading / from absolute path names in the archive.

user@host>
```

file archive (with Compression)

The following sample command archives and compresses all messages files in the local directory `/var/log/` as the single file `messages-archive.tar`.

```
user@host> file archive compress source /var/log/messages* destination /var/log/messages-
archive.tgz
/usr/bin/tar: Removing leading / from absolute path names in the archive.
user@host>
```

File Archive Using Secure Copy Protocol (scp) with 'source-address' and 'routing-instance' options

To use the scp command to archive a file with the `source-address` and `routing-instance` options, enter the following command:

```
user@host> file archive source source destination scp:// destination source-address address
routing-instance instance-name
```

File Archive Compress (with Exclude Option)

The following sample command archives and compresses all messages files in the local directory `/var/log/` and excludes the single file pattern specified.

```
user@host>file archive compress source /var/log destination /var/tmp/sample exclude trace*
/bin/tar: Removing leading `/' from member names
/bin/tar: /var/log/journal/dbf38b9cae4d11ec862e4fb4fcef8787/system.journal: file changed as we
read it
```

Release Information

Command introduced before Junos OS Release 7.4.

`exclude` option added in Junos OS Release 20.3R1 and Junos OS Evolved Release 20.3R1.

`routing-instance` option added in Junos OS Release 18.4R1.

`source-address` option added in Junos OS Release 18.4R1.

file compare

IN THIS SECTION

- Syntax | 7044
- Description | 7044
- Options | 7045
- Required Privilege Level | 7045
- Output Fields | 7045
- Sample Output | 7045
- Release Information | 7047

Syntax

```
file compare (files filename filename)
<context | unified>
<ignore-white-space>
```

Description

Compare two local files and describe the differences between them in default, context, or unified output styles:

- `Default`—In the first line of output, `c` means lines were changed between the two files, `d` means lines were deleted between the two files, and `a` means lines were added between the two files. The numbers preceding this alphabetical marker represent the first file, and the lines after the alphabetical marker represent the second file. A left angle bracket (<) in front of output lines refers to the first file. A right angle bracket (>) in front of output lines refers to the second file.

- `Context`—The display is divided into two parts. The first part is the first file; the second part is the second file. Output lines preceded by an exclamation point (`!`) have changed. Additions are marked with a plus sign (`+`), and deletions are marked with a minus sign (`-`).
- `Unified`—The display is preceded by the line number from the first and the second file (*xx,xxx,x*). Before the line number, additions to the file are marked with a plus sign (`+`), and deletions to the file are marked with a minus sign (`-`). The body of the output contains the affected lines. Changes are viewed as additions plus deletions.

Options

files *filename*	Names of two local files to compare.
context	(Optional) Display output in context format.
ignore-white-space	(Optional) Ignore changes in the amount of white space.
unified	(Optional) Display output in unified format.

Required Privilege Level

none

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

file compare files

```
user@host> file compare files /tmp/one /tmp/two

IN THIS SECTION

- Syntax | 7049
- Description | 7050
- Options | 7050
- Required Privilege Level | 7051
- Sample Output | 7051
- Release Information | 7052

Syntax

```
file copy source destination
<source-address source-address>
<staging-directory directory-location>
```

Description

Copy files from one location to another location on the local device or to a location on a remote device reachable by the local device.

For information on valid file name and URL formats, see *Format for Specifying Filenames and URLs in Junos OS CLI Commands*.

CAUTION: Starting with Junos OS Release 15.1, the `sslv3-support` option is not available for configuration with the `set system services xnm-ssl` and `file copy` commands. SSLv3 is no longer supported and available.

For all releases prior to and including Junos OS Release 14.2, SSLv3 is disabled by default at runtime. The `sslv3-support` option is hidden and deprecated in Junos OS Release 14.2 and earlier releases. However, you can use the `set system services xnm-ssl sslv3-support` command to enable SSLv3 for a Junos XML protocol client application to use as the protocol to connect to the Junos XML protocol server on a router, and you can use the `file copy source destination sslv3-support` command to enable the copying of files from an SSLv3 URL.

Using SSLv3 presents a potential security vulnerability, and we recommend that you not use SSLv3. For more details about this security vulnerability, see the Juniper Networks Knowledge Base articlehere.

NOTE: If you define an ordered set of ciphers, key exhange methods, or message authentication codes (MACs) at the `[edit system services ssh]` hierarchy level, the newly-defined set is used when copying files using secure copy protocol (scp). For more information, see *Configuring the SSH Service to Support Legacy Cryptography*.

Options

source	Specify the source URL.
destination	Specify the destination URL.
source-address ***source-address***	(Optional) Specify the local address to use in originating the connection.
staging-directory ***directory-location***	(Optional) Specify the staging directory on Routing Engine

> **NOTE**: If you are using a literal IPv6 address in your command entry, the address must be enclosed in [ ] brackets. This conforms to RFC 2732.

Required Privilege Level

maintenance

Sample Output

Following are some `file copy` examples.

Copy a File from the Local Device to a Personal Computer

```
user@host> file copy /var/tmp/rpd.core.4 mypc:/c/junipero/tmp

...transferring.file...... |          0 KB |   0.3 kB/s | ETA: 00:00:00 | 100%
```

Copy a Configuration File between Routing Engines

The following sample command copies a configuration file from Routing Engine 0 to Routing Engine 1:

```
user@host> file copy /config/juniper.conf re1:/var/tmp/copied-juniper.conf
```

Copy a File Using File Transfer Protocol which Requires a Password

You can use FTP with the `file copy` command for additional privacy. You will be prompted for a password. Enter the following command to enable FTP:

```
root@host> file copy filename ftp://user@hostname/filename
```

In the following example, **/config/juniper.conf** is the local file and **hostname** is the FTP server:

```
root@host> file copy /config/juniper.conf ftp://user@hostname/juniper.conf
Password:
```

```
Receiving ftp: //user@hostname/juniper.conf (2198 bytes): 100%
2198 bytes transferred in 0.0 seconds (2.69 MBps)
```

NOTE: Starting in Junos OS Evolved release 22.2R2, the password prompt has changed from `Password for user@hostname:` to `Password:`

Copy a File Using a Staging Directory

The following sample command copies a file using a staging directory

```
user@host> file copy re1:/var/tmp/junos-install-x.log /root/ staging-directory /var/tmp/tmp1
```

Release Information

Command introduced before Junos OS Release 7.4.

`source-address` option added in Junos OS Release 7.4.

`staging-directory` option added in Junos OS Release 17.3R1.

- Sample Output | 7053
- Release Information | 7054

Syntax

```
file delete filename
<purge>
```

Description

Delete a file on the local router or switch.

Options

filename Name of the file to delete. For a routing matrix, include chassis information in the filename if the file to be deleted is not local to the Routing Engine from which the command is issued.

purge (Optional) Overwrite regular files before deleting them.

Required Privilege Level

maintenance

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

file delete

```
user@host> file list /var/tmp
dcd.core
```

```
rpd.core
snmpd.core

user@host> file delete /var/tmp/snmpd.core
user@host> file list /var/tmp
dcd.core
rpd.core
```

file delete (Routing Matrix)

```
user@host> file list lcc0-re0:/var/tmp
dcd.core
rpd.core
snmpd.core

user@host> file delete lcc0-re0:/var/tmp/snmpd.core
user@host> file list /var/tmp
dcd.core
rpd.core
```

Release Information

Command introduced before Junos OS Release 7.4.

file (Event Scripts)

IN THIS SECTION

    start {
        start-options {
            mem-factor percentage;
        }
    }
}
```

Hierarchy Level

```
[edit event-options event-script]
```

Description

Enable a Junos OS event script that is located in the **/var/db/scripts/event** directory on the hard disk or the **/config/scripts/event** directory on the flash drive. After enabling an event script, an event policy can execute the event script when triggered.

Options

filename Name of a Python, Extensible Stylesheet Language Transformations (XSLT), or Stylesheet Language Alternative syntaX (SLAX) file containing an event script.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

maintenance—To view or add this statement in the configuration.

Release Information

Statement introduced in Junos OS Release 7.6.

- Syntax | 7058
- Hierarchy Level | 7058
- Description | 7058
- Options | 7058
- Required Privilege Level | 7058
- Release Information | 7059

Syntax

```
file filename;
```

Hierarchy Level

```
[edit accounting-options flat-file-profile profile-name]
```

Description

Specify the name of the accounting file created by a flat-file profile. By default, the filename becomes the name of the local directory where the accounting file is backed up: `/var/log/pfedBackup/filename`.

Options

filename Name of the accounting file. The complete output filename is in the format *filename.hostname.file-number_timestamp*.gz.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.1R4.

```

```
        no-remote-trace;
    }
    username username;
}
```

Hierarchy Level

```
[edit system extensions extension-service application]
```

Description

For files in the `[edit system extensions extension-service application]` hierarchy level, specify the configuration for each file in the extension-service application.

Options

arguments *arguments*
Specify the command-line arguments called by a JET application. A program can take any number of command-line arguments. Enter the arguments in the way the application expects. Developer must supply this information.

daemonize
Specify the file as daemonized. An application runs as a daemonized process in the background. An application configured to run as a daemonized process is automatically triggered upon commit. A non-daemonized application must be triggered manually from the command-line client.

filename
Local filename of the script file.

interpreter (bash | python | python3)
Specify whether a device running Junos OS Evolved should run a daemonized on-device JET application using Bash, Python 2, or Python 3.

> **NOTE**: Starting in Junos OS Evolved Release 22.3R1, Python 2.7 is no longer supported. The `python` statement is deprecated. Use the `python3` statement instead.

optional
Allow the operating system to commit the configuration even if the file is not available at the **/var/db/scripts/jet** file path.

respawn-on-normal-exit
Automatically restart a daemonized JET application written in Python after you exit the application normally, such as when you upgrade the JET application. If this option is not

configured, and if the application normally exits, it will not restart automatically. This option can only be used with Python JET applications that have been configured to run as a daemonized process using the `daemonize` option.

`username` *`username`*

Specify the name of the user under whose privileges the extension service will execute. This user name is configured at the `[edit system login]` hierarchy level. If you do not associate a user name with an extension-service application, the application is executed as user `nobody`.

- **Default:** nobody

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

maintenance—To view or add this statement in the configuration.

Release Information

Statement introduced in Junos OS Release 16.1.

`refresh`, `refresh-from`, `respawn-on-normal-exit`, `routing-instance`, and `source` options added in Junos OS Release 18.1R1.

`interpreter` option added in Junos OS Evolved Release 20.3R1.

`optional` option added in Junos OS and Junos OS Evolved Release 23.2R1.

file list

IN THIS SECTION

- Syntax | 7063
- Description | 7063
- Options | 7063
- Additional Information | 7063
- Required Privilege Level | 7063
- Sample Output | 7064

Release Information | 7065

Syntax

```
file list <detail | recursive> <path>
```

Description

Display a list of files on the local router or switch.

Options

none Display a list of files in the default directory. The default directory is the home directory of the user logged in to the router or switch.

detail (Optional) Display detailed information about the files. The output is similar to what is displayed by the Linux `ls -l` command.

recursive (Optional) Display detailed information about the files in the directory and all subdirectories below it.

path (Optional) List the files in a specified directory path. The path name cannot contain any special characters (`![ =;|(){}]`).

Additional Information

To view available directories, enter a space and then a slash (/) after the `file list` command. To view files within a specific directory, include a slash followed by the directory and, optionally, subdirectory name after the `file list` command.

Required Privilege Level

maintenance

Sample Output

file list

The following command lists the contents of the **/var/tmp** directory.

```
user@host> file list /var/tmp

/var/tmp:

file (System Logging)

IN THIS SECTION

- Syntax | 7085
- Hierarchy Level | 7085
- Description | 7086
- Options | 7086
- Required Privilege Level | 7086
- Release Information | 7086

Syntax

```
file filename {
    facility severity;
    archive {
        files number;
        size size;
        (no-world-readable | world-readable);
    }
    explicit-priority;
    match "regular-expression";
    match-strings string-name;
    structured-data {
        brief;
    }
}
```

Hierarchy Level

```
[edit system syslog]
```

Description

Configure the logging of system messages to a file.

Options

facility—Class of messages to log. To specify multiple classes, include multiple ***facility severity*** statements. For a list of the facilities, see *Junos OS System Logging Facilities*.

file ***filename***—File in the **/var/log** directory in which to log messages from the specified facility. To log messages to more than one file, include more than one **file** statement.

severity—Severity of the messages that belong to the facility specified by the paired ***facility*** name. Messages with severities of the specified level and higher are logged. For a list of the severities, see *System Log Message Severity Levels*.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

[edit logical-systems name system syslog host],
[edit logical-systems name system syslog user],
[edit system syslog file],
[edit system syslog host],
[edit system syslog user]
```

Description

Specify the file in which to log data. Starting in Junos OS Release 20.3R1, the `change-log` is a default option at [`edit system syslog file name`] hierarchy for SRX Series Firewalls. As the default option, `change-log`

records all the configuration changes. In Junos OS releases earlier than 20.2R1, you need to configure `change-log`.

Options

- *filename*—Specify the name of the file in which to log data.
- *allow-duplicates*—Do not suppress the repeated messages.
- *any*—Specify all facilities information.
  - *alert*—Specify the conditions that should be corrected immediately.
  - *critical*—Specify the critical conditions.
  - *emergency*—Specify the conditions that cause security functions to stop.
  - *error*—Specify the general error conditions.
  - *info*—Specify the information about normal security operations.
  - *none*—Do not specify any messages.
  - *notice*—Specify the conditions that should be handled specifically.
  - *warning*—Specify the general warning conditions.
- *archive*—Specify the archive file information.
  - *archive-sites*—Specify a list of destination URLs for the archived log files.
    - *url*—Specify the primary and failover URLs to receive archive files.
  - *binary-data*—Mark file such that it contains binary data.
  - *no-binary-data*—Do not mark the file such that it contains binary data.
  - *files*—Specify the number of files to be archived. Range: 1 through 1000 files.
  - *size*—Specify the size of files to be archived. Range: 65,536 through 1,073,741,824 bytes.
  - *world-readable*—Allow any user to read the log file.
  - *no-world-readable*—Do not allow any user to read the log file.
  - *start-time*—Specify the start time for file transmission. Enter the start time in the yyyy-mm-dd.hh:mm format.
  - *transfer-interval*—Specify the frequency at which to transfer the files to archive sites.

- *authorization*—Specify the authorization system.
- *change-log*—Specify the configuration change log.
- *conflict-log*—Specify the configuration conflict log.
- *daemon*—Specify the various system processes.
- *dfc*—Specify the dynamic flow capture.
- *explicit-priority*—Include the priority and facility in messages.
- *external*—Specify the local external applications.
- *firewall*—Specify the firewall filtering system.
- *ftp*—Specify the FTP process.
- *interactive-commands*—Specify the commands executed by the UI.
- *kernel*—Specify the kernel information.
- *match*—Specify the regular expression for lines to be logged.
- *ntp*—Specify the NTP process.
- *pfe*—Specify the Packet Forwarding Engine.
- *security*—Specify the security-related information.
- *structured-data*—Log the messages in structured log format.
  - *brief*—Omit English language text from the end of the logged message.
- *user*—Specify the user processes.
  - *info*—Specify the informational messages.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 12.1X47.

[edit routing-instances instance-name routing-options validation group group-name session
address traceoptions],
[edit routing-options validation traceoptions]
[edit routing-options validation group group-name session address traceoptions]
```

Description

Configure the file settings for tracing resource public key infrastructure (RPKI) BGP route validation.

Options

filename Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`.

files *number* (Optional) Maximum number of trace files. When a trace file named `trace-file` reaches its maximum size, it is renamed `trace-file.0`, then `trace-file.1`, and so on, until the maximum number of trace files is reached (*x*k to specify KB, *x*m to specify MB, or *x*g to specify gigabytes), at which point the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the `size` option.

- **Range:** 2 through 1000 files
- **Default:** 3 files

no-world-readable (Optional) Restrict file access to the user who created the file.

size *size* (Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named `trace-file` reaches its maximum size, it is renamed `trace-file.0`, then `trace-file.1`, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the `files` option.

- **Syntax:** *x*k to specify KB, *x*m to specify MB, or *x*g to specify GB
- **Range:** 10 KB through 1 GB
- **Default:** 128 KB

world-readable (Optional) Enable unrestricted file access.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

- Release Information | 7096

Syntax

```
(file-serialization | no-file-serialization);
```

Hierarchy Level

```
[edit security policies],
[edit services policies]
```

Description

Perform policy changes propagation to the dataplane using file serialization. By serializing policy configurations into files, the system ensure that they are read and applied by the PFE in a controlled and reliable manner.

By default, the file-based serialization feature is enabled. You can disable the file-serialization by using the following statement:

```
[edit]
user@host# set security policies no-file-serialization
```

To re-enable the file-serialization feature, use the following statement:

```
[edit]
user@host# delete security policies no-file-serialization
```

Or use the following statement:

```
[edit]
user@host# set security policies file-serialization
```

Required Privilege Level

- Options | 7109
- Required Privilege Level | 7109
- Release Information | 7109

Syntax

```
files number;
```

Hierarchy Level

```
[edit system syslog archive],
[edit system syslog file filename archive]
```

Description

Configure the maximum number of archived log files to retain. When the Junos OS logging utility has written a defined maximum amount of data to a log file ***logfile***, it closes the file, compresses it, and renames it to ***logfile*.0.gz** (for information about the maximum file size, see "size" on page 28007). The utility then opens and writes to a new file called ***logfile***. When the new file reaches the maximum size, the ***logfile*.0.gz** file is renamed to ***logfile*.1.gz**, and the new file is closed, compressed, and renamed ***logfile*.0.gz**. By default, the logging facility creates up to ten archive files in this manner. Once the maximum number of archive files exists, each time the active log file reaches the maximum size, the contents of the oldest archive file are lost (overwritten by the next oldest file).

Options

number—Maximum number of archived files.

- **Range:** 1 through 1000
- **Default:** 10 files

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

[edit class-of-service drop-profiles profile-name interpolate]
```

Description

When configuring weighted random early detection (WRED), map the fullness of a queue to a packet "drop-probability" on page 5953 value. You configure the `fill-level` and `drop-probability` statements in related pairs. The pairs of fill level and drop probability values set a probability of dropping packets at a specified queue fullness value.

The first fill level is the packet drop start point. Packets do not drop until the queue fullness reaches the first fill level. The last fill level is the packet drop end point. After the queue exceeds the fullness set by the drop end point, all non-ECN packets are dropped. As the queue fills from the drop start point to the drop end point, the rate of packet drop increases in a curve pattern. The higher the queue fill level, the higher the probability of dropping packets.

On switches that support only two fill level/drop probability pairs, the two pairs are the drop start point and the drop end point. On switches that support up to 32 fill level/drop probability pairs, you can configure intermediate interpolations between the drop start point and the drop end point, which provides greater flexibility in controlling the packet drop curve.

NOTE: Do not configure the last fill level as 100 percent.

Options

low-value (switches that support only two fill level/drop probability pairs)—Fullness of the queue before packets begin to drop, expressed as a percentage. The low value must be less than the high value.

- **Range:** 0 through 100

high-value (switches that support only two fill level/drop probability pairs)—Fullness of the queue before it reaches the maximum drop probability. If the queue fills beyond the fill level high value, all packets drop. The high value must be greater than the low value.

- **Range:** 0 through 100

level1 level2 ... level32 (switches that support 32 fill level/drop probability pairs)—The queue fullness level, expressed as a percentage. Each fill level pairs with a drop probability to define the probability of a packet dropping at a specified queue fullness.

- **Range:** 0 through 100

Required Privilege Level

    group filter-group-number;
}
```

Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number family inet]
```

Description

Apply a firewall filter to an interface. You can also use filters for encrypted traffic.

Options

`group` *`filter-group-number`*—Use the specified interface to be part of a filter group. The default filter group number is 0.

`input` *`filter-name`*—Use the specified filter to evaluate when packets are received on the interface.

`output` *`filter-name`*—Use the specified filter to evaluate when packets are transmitted on the interface.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

    output-list [ filter-names ];
}
```

Hierarchy Level

```
[edit interfaces interface-name unit logical-unit-number family family],
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number
family family]
```

Description

NOTE: On EX Series switches, the `group`, `input-list`, `output-filter` statements are not supported under the [`edit interfaces` *`interface-name`* `unit` *`logical-unit-number`* `family inet`], [`edit interfaces` *`interface-name`* `unit` *`logical-unit-number`* `family inet6`], and [`edit interfaces` *`interface-name`* `unit` *`logical-unit-number`* `family mpls`] hierarchies.

Apply a filter to an interface. You can also use filters for encrypted traffic. When you configure filters, you can configure them under the **family ethernet-switching**, **inet**, **inet6**, **mpls**, or **vpls** only.

Options

group *filter-group-number*—Define an interface to be part of a filter group. The default filter group number is 0.

- **Range:** 0 through 255

input ***filter-name***—Name of one filter to evaluate when packets are received on the interface.

output ***filter-name***—Name of one filter to evaluate when packets are transmitted on the interface.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Syntax

```
filter filter-name {
    interface-specific
    micro-segmentation;
    no-longest-prefix-match;
    term term-name {
        from {
            match-conditions;
        }
        then {
            action;
            action-modifiers;
        }
    }
}
```

Hierarchy Level

```
[edit firewall family family-name]
```

Description

Configure firewall filters.

Options

filter-name—Name that identifies the filter. The name can contain letters, numbers, and hyphens (-), and can be up to 64 characters long. To include spaces in the name, enclose it in quotation marks.

micro-segmentation—Indicates that this firewall filter is a Group Based Policy (GBP) tagging filter. A GBP tagging filter uses firewall terms to assign GBP tags for use with macro and micro segmentation on VXLAN. GBPs make use of existing layer 3 VXLAN network identifiers (VNI), in conjunction with firewall filter policies, to provide micro-segmentation at the level of device or tag, independent of the underlying network topology.

These match conditions are supported for GBP tagging:

- `ip-version ipv4` *<ip address>* | *<prefix-list>*

- `ip-version ipv6` *<ip address>* | *<prefix-list>*
- `mac-address` *<mac address>*
- `interface` *<interface_name>* vlan-id *<vlan id>*
- `vlan-id` *<vlan id>*
- `interface` *<interface_name>*

no-longest-prefix-match—Disables longest prefix match in IP-based GBP tagging filters. This causes IP-based firewall terms in GBP tagging filters to be evaluated in term order instead of by longest prefix match. This parameter is only applicable when **micro-segmentation** is enabled and is ignored otherwise. Set this parameter when you first create the filter. Do not toggle this parameter on an existing filter.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

firewall—To view this statement in the configuration.
firewall-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.1.

Option **micro-segmentation** introduced in Junos OS Release 22.4R1 to support GBP tagging filters.

Option **no-longest-prefix-match** introduced in Junos OS Release 24.4R1 to disable longest prefix match on IP-based GBP tagging filters.

filter (Identity Management Advanced Query)

IN THIS SECTION

- Syntax | 7139
- Hierarchy Level | 7139
- Description | 7139
- Options | 7140

Required Privilege Level | 7141
Release Information | 7141

Syntax

```
filter {
    domain name;
    exclude-ip {
        address-book book-name;
        address-set address-set;
    }
    include-ip {
        address-book book-name;
        address-set address-set;
    }
}
```

Hierarchy Level

```
[edit services user-identification identity-management]
```

Description

The advanced user identity query feature enables the SRX Series Firewall to communicate with the Juniper Identity Management Service (JIMS) server to obtain user identity information for an individual user (ip-query) or a group of users (batch query).

Optionally, you can configure filters to convey to the JIMS server at a more granular level the users for whom you want information, based on their IP addresses. The filter statement gives you the flexibility to specify a range of IP addresses to be excluded from the record that the JIMS server sends in response or a range of IP addresses to be included in it. You can also constrain the query target to users in one or more specific active directory domains. Only IPv4 addresses are supported.

You can configure a filter that includes all three specifications: `include-ip`, `exclude-ip`, and `domain`.

Filters are contextual. That is, you can use a different filter configuration for different requests. If you change the filter configuration, the new filter applies to subsequent user identity requests exclusively. It has no bearing on prior query requests

Use of the JIMS allows you to provision users locally and have their authentication information made available to other sites in your network for policy enforcement and reporting.

> **WARNING**: Before you use this feature, you must disable active-directory-access and authentication-source options under the user-identification hierarchy. You cannot commit this configuration if active directory authentication or the ClearPass query and webapi functions are configured and committed.

Options

include-ip address-book *book-name* address-set *address-set-name*. Optionally, configure a filter that directs the SRX Series Firewall to issue a query to the JIMS server to include in its response record user identity information for users based on IP addresses in certain address-ranges.

The following are the two behaviors when an `include-ip` is configured:

- Batch query—An SRX Series Firewall sends a request to JIMS with the include list of IP addresses.
- IP query—If the IP address to be queried is included, then the SRX Series Firewall queries JIMS only for those IP addresses that need to be included and does not query for other IP addresses; based on the IP query, JIMS does not trigger the PC probe for the IP addresses that are not included in the IP query.

A filter can include up to twenty IP address ranges. Therefore, an address set that contains more than twenty ranges will cause the filter configuration to fail. To specify the ranges, specify the name of a predefined address set which includes them and which is included in an existing address book.

The filter for IP addresses does not support nested address sets in an address book. If an address book contains nested address sets, it is ignored.

Here is an include-ip address configuration:

```
user@host# set security address-book mybook address addr1 range-address 198.51.100.0
to 198.51.120.0
user@host# set security address-book mybook address-set myset address addr1
```

```
user@host# set service user-identification identity-management filter include-ip
address-book mybook address-set myset
```

exclude-ip address-book *book-name* address-set *address-set-name*. Optionally, configure a filter that directs the SRX Series Firewall to issue a query to the JIMS server to exclude from its response record user identity information for users based on the specified address-ranges.

The following are the two behaviors when an `exclude-ip` is configured:

- Batch query—An SRX Series Firewall sends a request to JIMS with the exclude list of IP addresses.
- IP query—If the IP address to be queried is excluded, then no request is sent from an SRX Series Firewall to JIMS.

To specify the ranges, specify the name of a predefined address set which includes them and which is included in an existing address book. The address set must not include more than twenty IP addresses, otherwise the `exclude-ip` filter will fail. Here is an `exclude-ip` address configuration similar to that of the `include-ip` filter:

```
user@host# set security address-book mybook address addr1 range-address
198.51.100.0/24 to 198.51.120.0/24
user@host# set security address-book mybook address-set myset address addr1
user@host# set service user-identification identity-management filter exclude-ip
address-book mybook address-set myset
```

Starting in Junos OS Release 18.3R1, you can include or exclude IPv6 addresses for filtering the IP addresses, in addition to IPv4 addresses.

domain One or more active directory domains of interest to the SRX Series Firewall. You can specify up to twenty domain names for the filter.

Required Privilege Level

1. services—To view this statement in the configuration.
2. services-control—To add this statement to the configuration.

```

Description

Configure the options available for the `filter-interfaces` statement to specify the interfaces that you want to exclude from the output of SNMP `Get` and `GetNext` requests performed on interface-related MIBs.

Options

`all-internal-interfaces`—Filters out all the internal interfaces from the output of SNMP `Get` and `GetNext` requests. Internal interfaces include all interfaces belonging to juniper private routing-instances.

`interfaces` *`interfaces`*—Specify the interfaces to filter them out from the output of SNMP `Get` and `GetNext` requests. Use regular expressions to specify the interface.

Required Privilege Level

snmp—To view this statement in the configuration.

snmp-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

- Required Privilege Level | 7149
- Release Information | 7149

Syntax

```
filter-list-template;
```

Hierarchy Level

```
[edit firewall family (inet | inet6) filter filter-name],
[edit logical-systems logical-system-name firewall family (inet | inet6) filter filter-name]
```

Description

(MX5, MX10, MX40, and MX80 routers, and routers that use MX Series MPC line cards only) Configure all interfaces that use the same filter list to use a common template. This feature can be used to save microkernel memory and DMEM memory.

If the same filter list cannot be used on all interfaces, consider merging the filters and using the `from interface` firewall filter term to group the per-interface terms to produce a new common filter list.

> **NOTE**: If you configure both `fast-lookup-filter` and `interface-specific` statements, filter list templates are also used.

Required Privilege Level

firewall—To view this statement in the configuration.

firewall-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 13.3R9.

filter-profile

IN THIS SECTION

- Syntax | 7151
- Hierarchy Level | 7151
- Description | 7152
- Options | 7152
- Required Privilege Level | 7152
- Release Information | 7152

Syntax

```
filter-profile profile-name {
    counters {
        counter-name;
    }
    file filename;
    interval minutes;
    start-time time;
}
```

Hierarchy Level

```
[edit accounting-options]
```

Description

Create a profile to filter and collect packet and byte count statistics and write them to a file in the `/var/log` directory. To apply the profile to a firewall filter, you include the `accounting-profile` statement at the [`edit firewall filter` *`filter-name`*] hierarchy level. For more information about firewall filters, see *Firewall Filters Overview*.

Options

profile-name Name of the filter profile.

start-time ***time*** (Optional) Specify the start time in *yyyy-mm-dd.hh:mm* local time format for the accounting profile. Sometimes, if the time at which the records are written to the accounting file is beyond the transfer interval window of the file, drifting of accounting records occurs. To prevent drifting and to have predictable timestamps of when accounting data is written to an accounting file, we can specify the start time option for the accounting profile.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Firewall Filters Overview

Configuring the Filter Profile

filter (Security)

IN THIS SECTION

- Syntax | 7153
- Hierarchy Level | 7153
- Description | 7153
- Required Privilege Level | 7153
- Release Information | 7154

Syntax

```
filter threat-attack
```

Hierarchy Level

```
[edit security log stream stream-name]
```

Description

Configure the log stream filter to transmit only threat and attack logs to the ClearPass Policy Manager (CPPM). The integrated ClearPass authentication and enforcement feature sends to the CPPM threat and attack logs detected by the SRX Series Firewall security modules. You can use these reports to inform your approach to hardening the CPPM security policy. Setting the log stream filter to threat-attack ensures that the SRX Series Firewall and the log server are not overburdened by irrelevant logs.

NOTE: Unlike for other features that use a filter for log streams, threat-attack is the only log stream filter supported for integrated ClearPass. Therefore, it is not shown here as an option.

Required Privilege Level

1. security—To view this statement in the configuration.

2. security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3X48-D30.

filter-specific (QFX)

IN THIS SECTION

- Syntax | 7154
- Hierarchy Level | 7154
- Description | 7154
- Required Privilege Level | 7155
- Release Information | 7155

Syntax

```
filter-specific;
```

Hierarchy Level

```
[edit firewall policer policer-name]
```

Description

Configure a policer to be filter-specific, which means that Junos OS creates only one policer instance regardless of how many times the policer is referenced. If you use a filter-specific policer in multiple terms, both of the following are true:

- Traffic is policed at the aggregate rate. For example, if you create a policer that has a bandwidth limit of 100 Mbps and use the policer in two terms, the total allowed bandwidth for both terms is 100 Mbps—not 100 Mbps for each term.

- The implicit counter counts all the packets are that matched by any of the terms. For example, if you reference the same filter-specific policer in term1 and term2, and term1 matches 1000 packets and term2 matches 500 packets, the implicit counter shows 1500 matches for the policer.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration

Release Information

Statement introduced in Junos OS Release 11.1.

RELATED DOCUMENTATION

Configuring Two-Color and Three-Color Policers to Control Traffic Rates

Overview of Policers

filter-specific

IN THIS SECTION

- Syntax | 7155
- Hierarchy Level | 7156
- Description | 7156
- Required Privilege Level | 7156
- Release Information | 7156

Syntax

```
filter-specific;
```

Hierarchy Level

```
[edit dynamic-profiles profile-name firewall policer policer-name],
[edit firewall family inet prefix-action name],
[edit firewall policer policer-name],
[edit logical-systems logical-system-name firewall policer policer-name],
[edit logical-systems logical-system-name firewall family inet prefix-action name]
```

Description

By default, a policer operates in *term-specific* mode, which means that for a given *firewall filter*the Junos OS creates a separate policer instance for every filter term that references the policer. You can, however, use a common policer instance for all terms within the same firewall filter by setting the *filter-specific* option in the policer. In addition, for IPv4 firewall filters with multiple terms that reference the same policer, filter-specific mode counts and monitors the activity of the policer at the firewall filter level.

NOTE: Both filter-specific and term-specific apply to prefix-specific policer sets.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Logical systems support introduced in Junos OS Release 9.3.

Support at the `[edit dynamic-profiles ... policer policer-name]` hierarchy level introduced in Junos OS Release 11.4.

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.3. The `expression` option added in Junos OS Release 11.4.

Additional tags under filters of dynamic attack groups (CVSS score, age-of-attack, file-type, vulnerability-type) are added in Junos OS Release 18.2R1 for dynamic attacks grouping of IDP signatures. The Product and Vendor tags are already supported under existing filter products. The CLI interface for configuring these tags is more user friendly, with possible completions being available for configuration in 18.2R1.

fin-invalidate-session

IN THIS SECTION

- Syntax | 7165
- Hierarchy Level | 7165
- Description | 7165
- Required Privilege Level | 7167
- Release Information | 7167

Syntax

```
fin-invalidate-session;
```

Hierarchy Level

```
[edit security flow tcp-session]
```

Description

Invalidates a TCP session after the 4-way or 3-way handshake completes, with each session endpoint signalling conclusion of the session independently. New incoming SYN packets will need to establish a new TCP session.

When either session endpoint wants to terminate the session, it sends a FIN(ish) message. When the other session endpoint receives the packet with the FIN flag set, it sends an ACK(nowlege) message. Typically, tearing down a session involves transmission of a pair of FIN-ACK messages from each session endpoint.

After the side that sent the first FIN responds with the final ACK, it waits for a time-out period to expire before closing the connection. During the time-out period, the local port cannot be used for new connections. The time-out period protects against delayed packets from the terminating session being delivered during subsequent connections.

> **NOTE**: On SRX Series Firewalls with `fin-invalidate-session` configured the invalidation of the session occurs immediately whereas without `fin-invalidate-session` configured the session is set to time out 2 seconds after the 4-way or 3-way handshake completes.

Table 43 on page 7166 shows the sequence of packets for a 4-way handshake to terminate a session. In this case, the client signals the server that it is terminating the session. The server responds with an ACK message signaling acknowledgement of the client's FIN message. The ACK is followed immediately by a FIN message that the server sends to the client, signaling that it is terminating the session connection on its end. Finally, the client sends an ACK message to the server signalling that it received the server's FIN message.

Table 43: Terminating a Session with a 4-Way Handshake

Step	Client	Server
1.	FIN	
2.		ACK
3.		FIN • Sets session timer to 150 seconds.
4.	ACK • Sets session timer to 2 seconds.	

A session can be terminated by a 3-way handshake. In this case, the client sends a FIN message to the server. The server responds with message that combines the FIN and ACK messages. The sequence of packet exchange for a three-way handshake session close is as follows:

Step	Client	Server
1.	FIN	

2.		FIN/ ACK • sets session timer to 150 seconds
3.	ACK • sets session timer to 2 seconds

- Required Privilege Level | 7171
- Release Information | 7171

Syntax

```
final-response-timeout seconds;
```

Hierarchy Level

```
[edit access ocs partition partition-name]
```

Description

Configure the amount of time in seconds before an Online Charging System (OCS) partition stops attempting to send the final interrogation during the subscriber logout process. When a subscriber starts to logs out, the OCS sends a final interrogation. If there is no response within 24 hours, then the system continues and starts sending a logout message to the Policy and Charging Rule Function (PCRF). If there is no response within the next 24 hours, then the subscriber logout proceeds.

NOTE: Any configuration changes made to this statement apply to all subscribers currently waiting to log out within a 60 second period.

Options

seconds Number of seconds to wait before an OCS partition stops sending the final interrogation using a CCR-GY-T message.

- **Default:** 7200
- **Range:** 0 through 86,400 seconds (24 hours)

Required Privilege Level

Syntax

```
finger {
    connection-limit limit;
    rate-limit limit;
}
```

Hierarchy Level

```
[edit system services]
```

Description

Allow finger requests from remote systems to the local device.

Options

connection-limit *limit*

Configure the maximum number of connection sessions for the finger service per protocol (either IPv4 or IPv6).

> **NOTE**: The actual number of maximum connections depends on the availability of system resources, and might be fewer than the configured `connection-limit` value if the system resources are limited.

- **Range:** 1 through 250 connections
- **Default:** 75 connections

rate-limit *limit*

Configure the maximum number of connection attempts per minute, per protocol (either IPv6 or IPv4). For example, a rate limit of 10 allows 10 IPv6 finger session connection attempts per minute and 10 IPv4 finger session connection attempts per minute.

- **Range:** 1 through 250 connections
- **Default:** 150 connections

Required Privilege Level

firewall-authentication-forced-timeout

IN THIS SECTION

- Syntax | 7181
- Hierarchy Level | 7182
- Description | 7182
- Options | 7183
- Required Privilege Level | 7183
- Release Information | 7183

Syntax

```
firewall-authentication-forced-timeout minutes;
```

Hierarchy Level

```
[edit services user-identification active-directory-access]
```

Description

Configure the firewall authentication forced timeout setting to apply to entries for user who authenticate through captive portal.

When a user authenticates through captive portal, an authentication table entry is generated for that user based on the information that the SRX Series Firewall obtains from the firewall authentication module. At that point, the default traffic-based authentication timeout logic is applied to the entry. This statement gives you control over how long non-domain users who authenticate through captive portal remain authenticated.

When the firewall authentication forced timeout value is configured, it is used in conjunction with the traffic-based timeout logic.

Here is how timeout settings affect active directory authentication entries for users authenticated through captive portal.

- The firewall authentication forced timeout is set for 3 hours.

  Traffic continues to be received and generated by a device associated with an authentication entry for a user. After 3 hours the authentication entry expires, although at that time there are sessions anchored in Packet Forwarding Engine for the authentication entry.

- If set, the firewall authentication forced timeout has no effect.

  An authentication entry does not have sessions anchored to it. It expires after the time set for the authentication entry timeout, for example, 30 minutes.

- The firewall authentication forced timeout configuration is deleted.

  Firewall authentication forced timeout has no effect on new authentication entries. Firewall authentication forced timeout remains enforced for existing authentication entries to which it applied before it was deleted. That is, for those authentication entries, the original forced timeout setting remains in effect.

- The firewall authentication forced timeout configuration setting is changed.

  The new timeout setting is applied to new incoming authentication entries. Existing entries keep the original, former setting.

- The firewall authentication forced timeout is set to 0, disabling it.

If the firewall authentication forced timeout is set to a new value, that value is assigned to all incoming authentication entries. There is no firewall authentication forced timeout setting for existing authentication entries.

- The firewall authentication forced timeout value is not configured.
  - The SRX Series Firewall generates an authentication entry for a user. The default traffic-based timeout logic is applied to the authentication entry.
  - The active directory timeout value is configured for 50 minutes. A traffic-based timeout of 50 minutes is applied to an authentication entry.
  - The active directory timeout is not configured. The default traffic-based timeout of 30 minutes is applied to an authentication entry.

Options

minutes The maximum duration for which the non-domain users who authenticate through captive portal remain authenticated.

- **Default:** 30 minutes
- **Range:** 10 through 1440 minutes

Required Privilege Level

1. services—To view this statement in the configuration.
2. services-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1X49-D100.

Syntax

```
firewall-authentication {
    mtls-profile profile-name;
    mtls-profile-fallback-password;
    traceoptions (Security Firewall Authentication) {
        flag (all | authentication | proxy) {
        }
    }
}
```

Hierarchy Level

```
[edit security]
```

Description

Defines the type of firewall authentication available for a logical system. Also specifies the data plane firewall authentication tracing options.

Options

- `mtls-profile`—Enable passwordless user authentication based on client/server certificate validation using a public/private key.
- `mtls-profile-fallback-password`—Enable user authentication with mTLS and fallback to standard login when it fails.
- `flag`—Trace operation to perform. To specify more than one trace operation, include multiple flag statements.
  - `all`—Enable all tracing operations.
  - `authentication`—Trace data-plane firewall authentication events.
  - `proxy`—Trace data-plane firewall authentication proxy events.
- `detail`—Display moderate amount of data.
- `extensive`—Display extensive amount of data.
- `terse`—Display minimum amount of data.

Required Privilege Level

    }
}
```

Hierarchy Level

```
[edit security policies from-zone zone-name to-zone zone-name policy policy-name then permit]
```

Description

Configure firewall authentication methods.

On SRX Series Firewall, you must configure security policy with firewall-authentication at initial stage. When ssl-termination-profile is engaged with firewall-authentication in security policy, you can't configure `dynamic-application` statement at `[edit security policies from-zone zone-name to-zone zone-name policy policy-name match]` hierarchy level.

Options

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 8.5.

Support added for the `user-firewall` option in Junos OS Release 12.1X45-D10.

Support for the `ssl-termination-profile` and `web-redirect-to-https` options added on SRX5600 and SRX5800 Services Gateways starting from Junos OS Release 12.1X44-D10, on SRX5400 devices starting from 12.1X46-D10, and on vSRX Virtual Firewall, SRX300, SRX320, SRX340, SRX345, SRX380, SRX550M, and SRX1500 Services Gateways starting from Junos OS Release 15.1X49-D40.

Starting with Junos OS Release 15.1X49-D70 and Junos OS Release 17.3R1, support for the `web-redirect` and `web-redirect-to-https` options under `user-firewall` added on SRX300, SRX320, SRX340, SRX345, SRX380, SRX550M, SRX1500, SRX4100, SRX4200, SRX5400, SRX5600, and SRX5800 devices and vSRX Virtual Firewall Services Gateways.

Starting with Junos OS Release 15.1X49-D90 and Junos OS Release 17.3R1, support for the `auth-only-browser` option was added under `pass-through` and `user-firewall` and the `auth-user-agent` option was added under `pass-through auth-only-browser` on SRX300, SRX320, SRX340, SRX345, SRX380, SRX550M,

SRX1500, SRX4100, SRX4200, SRX5400, SRX5600, and SRX5800 devices and vSRX Virtual Firewall Services Gateways.

Starting with Junos OS Release 15.1X49-D90 and Junos OS Release 17.3R1, support for the `auth-only-browser` option was added under `pass-through` and `user-firewall` and the `auth-user-agent` option was added under `pass-through auth-only-browser` on SRX300, SRX320, SRX340, SRX345, SRX380, SRX550M, SRX1500, SRX4100, SRX4200, SRX5400, SRX5600, and SRX5800 devices and vSRX Virtual Firewall Services Gateways. Starting with Junos OS Release 15.1X49-D100 and Junos OS Release 17.3R1, support was added for `push-to-identity-management`.

Description

Configure the Quality of Service (QoS) attributes for a 5G QoS identifier (5QI) value in the 5QI table.

Customers send data packets across the access Y5 interface to the Access Gateway Function (AGF) in clear IP text. AGF encapsulates the data packet using GPRS Tunnelling Protocol (GTP) and forwards the encapsulated packet to the 5GC. To support GTP encapsulation, AGF sets the QFI and DSCP value in the outer IP header based on the packet priority, forwarding class, and packet loss priority of the data.

AGF looks for 5QI and QoS Flow ID (QFI) values in N2 signaling messages from the Access and Mobility Function (AMF) and matches those values to parameters in the 5QI table. AGF derives the forwarding class and loss priority from the 5QI mapping table. AGF classifies data packet priority using the authorized QoS rules sent in the N1 signaling messages. AGF manages individual subscriber session and applies the QoS rules that corresponds to the 5QI in the 5QI mapping table. AGF can then update differentiated services code point (DSCP) in the payload to match the derived QoS parameters. When you configure DSCP parameters in the 5QI mapping table, AGF overrides the payload DSCP. AGF updates both the inner and outer the IP header when it forwards the GTP packet in the data plane.

This statement allows you to:

- Override the QoS attributes for the non-dynamic 5QI.
- Add a dynamic 5QI and its QoS attributes.

You can configure the following QoS attributes for each defined 5QI. AGF uses the information to update the DSCP value in the IP header as it forwards the data packet from the Y5 interface to the N3 interface.

- Forwarding Class
- Packet Loss Priority
- Upstream DSCP
- Upstream N3 DSCP

Options

identifier 5QI number

Range: 0 through 63

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Command introduced in Junos OS Release 23.2R1.

address traceoptions],
[edit routing-options validation traceoptions]
[edit routing-options validation group group-name session address traceoptions]
```

Description

Configure the flags for tracing resource public key infrastructure (RPKI) BGP route validation.

Options

flag Tracing operation to perform. To specify more than one RPKI BGP route validation tracing operation, include multiple `flag` statements.

- Values:
  - all—Trace all events.
  - error—Trace errored packets.
  - keepalive— RPKI-to-router protocol keepalive messages. If you enable the BGP `update` flag only, received keepalive messages do not generate a trace message.

- nsr-synchronization— Nonstop routing synchronization events. (Not valid at [edit routing-options validation group *group-name* session *address*].
- packets—All incoming and outgoing packets.
- policy—Policy processing. (Not valid at [edit routing-options validation group *group-name* session *address*].
- state—State transitions.
- task—Routing protocol task processing.
- timer—Routing protocol timer processing.
- update—Update packets. These packets provide routing updates to BGP systems. If you enable only this flag, received keepalive messages do not generate a trace message. Use the `keepalive` flag to generate a trace message for keepalive messages.

disable (Optional) Disable the specific tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as `all`.

flag-modifier (Optional) Modifier for the tracing flag. You can specify one or more of these modifiers.

- Values:
  - detail—Provide detailed trace information.
  - receive—Trace the packets being received.
  - send—Trace the packets being transmitted.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.2.

Hierarchy Level

[edit accounting-options]

Description

Configure a flat-file accounting profile that defines the contents of a flat file that records accounting statistics collected from the Packet Forwarding Engine for an interface at regular intervals. To be used, the profile is associated with a subscriber interface. The accounting flat file is archived by the accounting-options archiving mechanism.

Options

profile-name	Name of the flat-file profile.
start-time *time*	(Optional) Specify the start time in *yyyy-mm-dd.hh:mm* local time format for the accounting profile. Sometimes, if the time at which the records are written to the accounting file is beyond the transfer interval window of the file, drifting of accounting records occurs. To prevent drifting and to have predictable timestamps of when accounting data is written to an accounting file, we can specify the start time option for the accounting profile.
use-fc-ingress-stats	Enables forwarding class counters.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.1R4.

`service-accounting` option added in Junos OS Release 17.1.

Support for the `service-accounting` option removed in Junos OS Release 18.1R4.

`use-fc-ingress-stats` option added in Junos OS Release 21.2R1.

flex-flow-sizing

IN THIS SECTION

- Syntax | 7226
- Hierarchy Level | 7226
- Description | 7226
- Options | 7226
- Required Privilege Level | 7226
- Release Information | 7226

Syntax

```
flex-flow-sizing;
```

Hierarchy Level

```
[edit chassis fpc slot-number inline-services]
```

Description

Configure support for the service creation of flows for inline services sampling. This configuration results in a first-come-first-serve creation of flows. Whichever flow comes first, that is allowed to occupy the flow-table if there is space in the table. Otherwise, the flow is dropped and an error count is created.

> **NOTE**: You cannot configure the `explicit flow-table-sizes` because `flex-flow-sizing` and `explicit flow-table-sizes` are mutually exclusive.
>
> You need not perform `fpc` reboot to change from `flex` to `per family` configuration.

Options

- **Default:** 1K flows for IPv6 and VPLS flows each.
- **Range:** 15 through 256K flows for IPv4.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.1F5.

> **NOTE**: As a workaround for `flex-flow-sizing` on MX204 router for releases earlier than Junos OS Release 17.4R2 or Junos OS Release 18R3, replace the `flex-flow-sizing`

statement with the `flow-table-size` statement configuration and reload the box. Configure the `flow-table-size` statement value within a range of 1 through 15. If the `flex-flow-sizing` statement is configured, deactivate or delete the same. For example:

```
flow-table-size {
    ipv4-flow-table-size 10;
    ipv6-flow-table-size 4;
}
```

- Release Information | 7231

Syntax

```
flexible-cross-connect-vlan-aware;
```

Hierarchy Level

```
[edit logical-systems name routing-instances name protocols evpn],
[edit routing-instances name protocols evpn]
```

Description

Enable EVPN-VPWS flexible cross-connect (FXC) VLAN aware service. For FXC service, all point-to-point Ethernet services under the same EVPN-VPWS instance share the same incoming MPLS label. FXC allows you to aggregate attachment circuits in the same EVPN-VPWS instance into a single group. For FXC VLAN aware services, you assign a unique service identifier to each attachment circuits in the same group. As a result, each attachment circuit will have its own Ethernet Auto-Discovery per EVPN Instance (EVI) route. When you enable `flexible-cross-connect-vlan-aware` services, you configure the pseudowire service (PS) interface under the routing protocol EVPN hierarchy.

The following sample configuration shows an EVPN-VPWS `flexible-cross-connect-vlan-aware` routing instance:

```
routing-instances evpn-vpws-A {
   instance-type evpn-vpws;
   interface ps0.0;
   route-distinguisher 192.168.2.3:100;
   vrf-target target:100:100;
   protocols {
      evpn {
         flexible-cross-connect-vlan-aware;
         interface ps0.1 {
            vpws-service-id {
               local 101;
               remote 201;
            }
         }
      }
    }
 }
```

- Description | 7234
- Required Privilege Level | 7234
- Release Information | 7235

Syntax

```
flexible-queuing-mode;
```

Hierarchy Level

```
[edit chassis]
```

Description

Enable flexible queuing on a non-HQoS MPCE that is installed in an MPC slot. A maximum of up to 32,000 queues are supported per port and per card, including queues on both ingress and egress interfaces.

When flexible queuing is enabled, the non-HQoS MPC is restarted for the changes to take effect and is brought online only if the power required for the queuing component is available in the power entry module (PEM). The MPC remains offline if the PEM cannot meet the power requirement for the queuing component.

You can configure flexible queuing even when a non-HQoS MPC is not present in the chassis. The configuration takes effect when a non-HQoS MPC is installed.

For more information about the MPCs and the Junos OS release that support this feature, see *Flexible Queuing Mode Overview*.

Required Privilege Level

interface—To view this statement in the configuration.

```

Hierarchy Level

```
[edit interfaces irb unit name family inet address <local-ip-address>/<prefix-length> | arp
<local-ip-address> mac <local-ip-address>]
```

Description

You can configure the `flood-as-unknown-unicast` statement for IRB interfaces located in any Layer 2 domain.

You can enable the `flood-as-unknown-unicast` statement for unicast MAC addresses. When a switch receives traffic from a unicast MAC address that is the destination MAC address, the switch floods the packets on the VLAN where the IRB interface is located.

When a Microsoft load balancer cluster is connected to a device in an EVPN-VXLAN or Layer2 EVPN-MPLS domain, the nodes in the cluster don't export their virtual MAC addresses along with their address resolution protocol (ARP) packets. In this case, the switch doesn't learn the virtual MAC addresses and drops any traffic coming from those addresses. When you enable the `flood-as-unknown-unicast` statement for a virtual MAC address on your switch, the switch can learn the Microsoft load balancer node's virtual MAC address. When the virtual MAC address is the destination MAC, the switch floods the traffic on the Microsoft load balancer nodes.

NOTE: If you've configured assisted replication, flooding occurs on assisted replication virtual tunnel endpoints (VTEP), not regular VTEPs.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

[edit protocols isis interface interface-name level level-number],
[edit protocols isis level level-number],
[edit routing-instances routing-instance-name protocols isis interface interface-name level level-number]
```

Description

IS-IS supports flood-reflector interfaces. Flood reflectors enable the creation of topologies where Level 1 areas provide transit forwarding for Level 2 destinations within a Level 2 topology. This is accomplished by creating Level 2 flood-reflection adjacencies within each Level 1 area.

The Level 2 flood reflection adjacencies are used to flood Level 2 link-state packet data units (PDUs), and are used in the Level 2 SPF computation. Therefore, the flood reflectors limit link-state PDU flooding over IS-IS interfaces. We designate the Flexible Tunnel Interfaces (FTI) as flood-reflector interfaces.

Options

client Configure interface as a flood-reflector client.

reflector Configure interface as a flood reflector.

cluster-id The flood-reflector cluster identifier that allows a flood reflector client to establish flood reflector adjacencies with multiple flood reflectors.

- **Range:** 1 through 42,94,967,295

> **NOTE:**
>
> - `flood-reflector` must be configured on the FTI interface only.
> - `flood-reflector` must be configured at IS-IS Level 2 only.
> - The option `reflector` cannot be configured together with the option `client`. This enforces that the same router cannot be both a flood reflector and a flood-reflector client for the same level.
> - At the `[edit protocols isis level level number flood-reflector reflector]` hierarchy level, the `cluster-id` must be configured.
> - At the `[edit protocols isis level level number flood-reflector client]` hierarchy level, the `cluster-id` must not be configured.
> - To configure the `cluster-id` option at the `[edit protocols isis interface interface name level level number flood-reflector reflector]` hierarchy level, the `client` must be configured at the `[edit protocols isis level level number flood-reflector client]` hierarchy level.

Required Privilege Level

routing—To view this statement in the configuration.

flood (Security ICMP)

IN THIS SECTION

- Syntax | 7245
- Hierarchy Level | 7245
- Description | 7245
- Options | 7245
- Required Privilege Level | 7246
- Release Information | 7246

Syntax

```
flood {
    threshold number;
}
```

Hierarchy Level

```
[edit security screen ids-option screen-name icmp]
```

Description

Configure the device to detect and prevent Internet Control Message Protocol (ICMP) floods. An ICMP flood occurs when ICMP echo requests are broadcast with the purpose of flooding a system with so much data that it first slows down, and then times out and is disconnected. The threshold defines the number of ICMP packets per second allowed to ping the same destination address before the device rejects further ICMP packets.

Options

`threshold` *`number`* —Number of ICMP packets per second allowed to ping the same destination address before the device rejects further ICMP packets.

- **Range:** 1 through 1,000,000 per second
- **Default:** 1,000 per second

> **NOTE**: For SRX Series Firewalls the applicable range is 1 through 4,000,000 per second.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement modified in Junos OS Release 9.2.

Syntax

```
flood {
    threshold number;
    white-list name;
}
```

Hierarchy Level

```
[edit security screen ids-option screen-name udp]
```

Description

Configure the device to detect and prevent UDP floods. UDP flooding occurs when an attacker sends UDP packets to slow down the system to the point that it can no longer process valid connection requests.

The threshold defines the number of UDP packets per second allowed to ping the same destination IP address/port pair. When the number of packets exceeds this value within any 1-second period, the device generates an alarm and drops subsequent packets for the remainder of that second.

Options

`threshold` *`number`* —Number of UDP packets per second allowed to ping the same destination address before the device rejects further UDP packets.

- **Range:** 1 through 4,000,000 per second
- **Default:** 1,000 per second

For SRX300, SRX320, SRX340, and SRX345, the applicable range is 1 through 100,000 per second.

For SRX1500, SRX4100, SRX4200, and vSRX Virtual Firewall, the applicable range is 1 to 1,000,000.

For SRX4600, SRX5400, SRX5600, and SRX5800, the applicable range is 1 through 4,000,000 per second.

`white-list` *`name`* —Configure a list of IP addresses that are exempted from UDP flood detection, which occur during the UDP flood screen protection process. This list of exempted addresses is called an allowlist.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Description

Configure a flow route.

Default

`legacy`

Options

`discard-action-for-unresolved-redir-addr` For action redirect IP if redirect address is unresolved install discard action filter.

fast-lookup-filter Enable fast lookup filter.

> **NOTE**: The option fast-lookup-filter is supported on MX Series devices only.

no-fast-lookup-filter Disable fast lookup filter.

> **NOTE**: The option no-fast-lookup-filter is supported on MX Series devices only.

Default: no-fast-lookup-filter

`firewall-install-disable`—(PTX The `firewall-install-disable` statement appears in the default configuration, preventing installation of flow-specification firewall filters into dfwd. For other

Series routers only)

models, this setting is omitted from the default configuration, allowing installation of flow-specification firewall filters into dfwd.

interface-group *group*

Interface-group for applying flowspec filter.

- *group*—Interface group ID to match traffic (1..255).
- exclude—Don't apply flowspec filter to traffic on this group.

per-route-accounting

Enable traffic accounting per flowspec route.

no-per-route-accounting

Disable traffic accounting per flowspec route.

route *name*

Name of the flow route.

match *match-conditions*

Match packets to these conditions.

destination *prefix*

IP destination address field.

destination-port *destination-port-names*

TCP or User Datagram Protocol (UDP) destination port field. You cannot specify both the port and destination-port match conditions in the same term.

In place of the numeric value, you can specify one of the following text synonyms (the port numbers are also listed): afs (1483), bgp (179), biff (512), bootpc (68), bootps (67), cmd (514), cvspserver (2401), dhcp (67), domain (53), eklogin (2105), ekshell (2106), exec (512), finger (79), ftp (21), ftp-data (20), http (80), https (443), ident (113), imap (143), kerberos-sec (88), klogin (543), kpasswd (761), krb-prop (754), krbupdate (760), kshell (544), ldap (389), login (513), mobileip-agent (434), mobilip-mn (435), msdp (639), netbios-dgm (138), netbios-ns (137), netbios-ssn (139), nfsd (2049), nntp (119), ntalk (518), ntp (123), pop3 (110), pptp (1723), printer (515), radacct (1813), radius (1812), rip (520), rkinit (2108), smtp (25), snmp (161), snmptrap (162), snpp (444), socks (1080), ssh (22), sunrpc (111), syslog (514), tacacs-ds (65), talk (517), telnet (23), tftp (69), timed (525), who (513), xdmcp (177), zephyr-clt (2103), or zephyr-hm (2104).

dscp *value*

Differentiated Services code point (DSCP). The DiffServ protocol uses the type-of-service (ToS) byte in the IP header. The most significant six bits of this byte form the DSCP.

- **Range:** You can specify DSCP in hexadecimal or decimal form from 0 through 63.

fragment *fragment-value*

IP header Fragment field.

The keywords are grouped by the fragment type with which they are associated:

- first-fragment
- is-fragment

- last-fragment
- not-a-fragment

icmp-code ***icmp-code-value***

ICMP code field. This value or keyword provides more specific information than icmp-type. Because the value's meaning depends on the associated icmp-type value, you must specify icmp-type along with icmp-code.

In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed). The keywords are grouped by the ICMP type with which they are associated:

- parameter-problem: ip-header-bad (0), required-option-missing (1)
- redirect: redirect-for-host (1), redirect-for-network (0), redirect-for-tos-and-host (3), redirect-for-tos-and-net (2)
- time-exceeded: ttl-eq-zero-during-reassembly (1), ttl-eq-zero-during-transit (0)
- unreachable: communication-prohibited-by-filtering (13), destination-host-prohibited (10), destination-host-unknown (7), destination-network-prohibited (9), destination-network-unknown (6), fragmentation-needed (4), host-precedence-violation (14), host-unreachable (1), host-unreachable-for-TOS (12), network-unreachable (0), network-unreachable-for-TOS (11), port-unreachable (3), precedence-cutoff-in-effect (15), protocol-unreachable (2), source-host-isolated (8), source-route-failed (5)

icmp-type ***icmp-type-value***

ICMP packet type field. Normally, you specify this match in conjunction with the protocol match statement to determine which protocol is being used on the port.

In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed): echo-reply (0), echo-request (8), info-reply (16), info-request (15), mask-request (17), mask-reply (18), parameter-problem (12), redirect (5), router-advertisement (9), router-solicit (10), source-quench (4), time-exceeded (11), timestamp (13), timestamp-reply (14), or unreachable (3).

packet-length ***packet-length***

Total IP packet length value can range from 0 through 65535.

port ***port-names***

TCP or UDP source or destination port field. You cannot specify both the port match condition and either the destination-port or source-port match condition in the same term.

In place of the numeric value, you can specify one of the text synonyms listed under destination-port.

protocol *number*	In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed): `ah` (51), `egp` (8), `esp` (50), `gre` (47), `icmp` (1), `igmp` (2), `ipip` (4), (41), `ospf` (89), `pim` (103), `rsvp` (46), `tcp` (6), or `udp` (17).
source *prefix*	IP source address field.
source-port *source-port-names*	TCP or UDP source port field. You cannot specify the `port` and `source-port` match conditions in the same term. In place of the numeric field, you can specify one of the text synonyms listed under `destination-port`.
tcp-flags *tcp-flags*	TCP header format.
no-install	Prohibit installing received routes in the forwarding table.
then	Actions to take on matching packets.
accept	Accept a packet. This is the default value.
community *name*	Replace any communities in the route with the specified communities.
discard	Discard a packet silently, without sending an Internet Control Message Protocol (ICMP) message.
mark *value*	Set a DSCP value for traffic that matches this flow. Specify a value from 0 through 63. This action is supported only on Junos devices with MPCs that are configured for `enhanced-ip` mode.
redirect	Redirect (tunnel) this flow's traffic to given next-hop address.
next-term	Continue to the next match condition for evaluation.
rate-limit *rate-limit*	Limit the bandwidth on the flow route. Express the limit in bits per second (bps).
routing-instance *route-target-extended-community*	Specify a routing instance to which packets are forwarded.
sample	Sample the traffic on the flow route.
term-order (legacy | standard)	• `legacy`—Use version 6 of the flow-specification algorithm.

- `standard`—Use version 7 of the flow-specification algorithm.

Default: legacy

validation

Flow route validation options. Flow specifications received from peers are validated such that it is considered feasible.

traceoptions

Define tracing operations that track all routing protocol functionality in the routing device.

file

Trace file options.

- *`filename`*—Name of file in which to write trace information.
- `files`—Maximum number of trace files (2..1000).
- `no-world-readable`— Don't allow any user to read the log file.
- `size`—Maximum trace file size (10240..4294967295).
- `world-readable`—Allow any user to read the log file.

flag

Tracing parameters.

- `all`—Trace everything.
- `flash`—Trace flash processing.
- `general`—Trace general events.
- `normal`—Trace normal events.
- `policy`—Trace policy processing
- `resolution`—Trace flow to unicast. route resolution
- `route`—Trace routing information.
- `state`—Trace state transitions.
- `task`—Trace routing protocol task processing.
- `timer`—Trace routing protocol timer processing.
  - `detail`—Trace detailed information.

- `disable`—Disable this trace flag.
- `receive`—Trace received packets.
- `send`—Trace transmitted packets.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

[edit services flow-monitoring version-ipfix template template-name],
[edit services flow-monitoring version9 template template-name],
[edit services flow-monitoring version-ipfix template template-name]
```

Description

Set the interval after which an active flow is exported.

NOTE:

- The router must include an Adaptive Services, Multiservices, or Monitoring Services PIC for this statement to take effect.
- For Trio-based routers, if you configure the `inline-jflow` statement at the `[edit forwarding-options sampling instance` *`instance-name`* `family inet output]` hierarchy level, timed-out flows are exported even if the router does not contain a Multiservices card.

Options

seconds—Duration of the timeout period.

- **Range:** 60 through 1800 seconds (for `forwarding-options` configurations); 10 through 600 seconds (for `services` configurations)
- **Default:** 1800 seconds (for `forwarding-options` configurations); 60 seconds (for `services` configurations)

NOTE: In active flow monitoring, the cflowd or flow monitoring version 9 records are exported after a time period that is a multiple of 60 seconds and greater than or equal to the configured active timeout value. For example, if the active timeout value is 90 seconds, the cflowd or flow monitoring version 9 records are exported at 120-second intervals. If the active timeout value is 150 seconds, the cflowd or flow monitoring version 9 records are exported at 180-second intervals, and so forth.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Support at the `[edit services flow-monitoring version-ipfix template` *`template-name`*`]` hierarchy level added in Junos OS Release 10.2.

Support at the [edit services flow-monitoring version9 template *template-name*] hierarchy level added in Junos OS Release 16.1 for MPLS traffic flows.

Flow Collection Overview

flow-control (ACX Series)

IN THIS SECTION

- Syntax | 7265
- Hierarchy Level | 7266
- Description | 7266
- Default | 7266
- Required Privilege Level | 7266
- Release Information | 7266

Syntax

```
(flow-control | no-flow-control);
```

Hierarchy Level

```
[edit interfaces interface-name aggregated-ether-options],
[edit interfaces interface-name ether-options],
[edit interfaces interface-name fastether-options],
[edit interfaces interface-name gigether-options],
[edit interfaces interface-name multiservice-options],
[edit interfaces interface-range name aggregated-ether-options],
[edit interfaces interface-range name ether-options]
```

Description

For aggregated Ethernet, Fast Ethernet, and Gigabit Ethernet interfaces only, explicitly enable flow control, which regulates the flow of packets from the router or switch to the remote side of the connection. Enabling flow control is useful when the remote device is a Gigabit Ethernet switch. Flow control is not supported on the 4-port Fast Ethernet PIC.

NOTE: On the Type 5 FPC, to prioritize control packets in case of ingress oversubscription, you must ensure that the neighboring peers support MAC flow control. If the peers do not support MAC flow control, then you must disable flow control.

Default

Flow control is enabled.

NOTE: Flow control is enabled by default only on physical interfaces and it is disabled by default on aggregated Ethernet interfaces.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.

Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.

Configuring Flow Control

Configuring Gigabit Ethernet Interfaces (CLI Procedure)

flow-control

IN THIS SECTION

- Syntax | 7267
- Hierarchy Level | 7267
- Description | 7267
- Default | 7268
- Required Privilege Level | 7268
- Release Information | 7268

Syntax

```
(flow-control | no-flow-control);
```

Hierarchy Level

```
[edit interfaces interface-name ether-options]
```

Description

Explicitly enable or disable symmetric Ethernet PAUSE flow control, which regulates the flow of packets from the switch to the remote side of the connection by pausing all traffic flows on a link during periods of network congestion. Symmetric flow control means that Ethernet PAUSE is enabled in both directions. The interface generates and sends Ethernet PAUSE messages when the receive buffers fill to a certain threshold and the interface responds to PAUSE messages received from the connected peer.

You can configure asymmetric flow control by including the `configured-flow-control` statement at the `[edit interfaces interface-name ether-options` hierarchy level. Symmetric flow control and asymmetric flow control are mutually exclusive features. If you attempt to configure both, the switch returns a commit error.

> **NOTE**: Ethernet PAUSE temporarily stops transmitting all traffic on a link when the buffers fill to a certain threshold. To temporarily pause traffic on individual "lanes" of traffic (each lane contains the traffic associated with a particular IEEE 802.1p code point, so there can be eight lanes of traffic on a link), use priority-based flow control (PFC).
>
> Ethernet PAUSE and PFC are mutually exclusive features, so you cannot configure both of them on the same interface. If you attempt to configure both Ethernet PAUSE and PFC on an interface, the switch returns a commit error.

- `flow-control`—Enable flow control; flow control is useful when the remote device is a Gigabit Ethernet switch.
- `no-flow-control`—Disable flow control.

Default

Whether flow control is enabled or disabled by default depends on the platform. Run `show interfaces interface-name` to see whether flow control is enabled on an interface.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.1.

Understanding Ethernet Interfaces

flow-control-options

IN THIS SECTION

- Syntax | 7270
- Hierarchy Level | 7271
- Description | 7271
- Usage Guidelines | 7272
- Required Privilege Level | 7272
- Release Information | 7272

Syntax

```
flow-control-options {
    down-on-flow-control;
    dump-on-flow-control;
    reset-on-flow-control;
    up-on-flow-control;
}
```

Hierarchy Level

```
[edit interfaces mo-fpc/pic/port multiservice-options]
```

Description

Configure the flow control options for application recovery in case of a prolonged flow control failure.

- `down-on-flow-control`—Bring interface down during prolonged flow control.
- `dump-on-flow-control`—Cause core dump during prolonged flow control.

> **NOTE**: Starting with Junos OS Release 15.1, on MX Series routers with MS-MICs and MS-MPCs, instead of an eJunos kernel core file, the multiservices PIC management daemon (mspmand) core file is generated when a prolonged flow control failure occurs and when you configure the setting to generate a core dump during prolonged flow control (by using the `dump-on-flow-control` option with the `flow-control-options` statement). The watchdog functionality continues to generate a kernel core file in such scenarios.

- `reset-on-flow-control`—Reset interface during prolonged flow control.

> **NOTE**: Starting in Junos OS Release 16.1R7, the `reset-on-flow-control` option has no effect on the MS-MIC, MS-MPC, MS-DPC, MS-PIC 100, MS-PIC 400, and MS-PIC 500 line cards. This is because starting in Release 16.1R7, Junos OS restarts these line cards to recover them from stuck state due to prolonged flow control.

- `up-on-flow-control`—Cause interface to remain in stuck state until you manually restart the PICs.

> **NOTE**: Starting in Junos OS Release 16.1R7, if interfaces on an MS-PIC or MS-DPC are in stuck state because of prolonged flow control, Junos OS restarts the service PICs to recover them from this state. However, if you want the PICs to remain in stuck state until you manually restart the PICs, configure the `up-on-flow-control` option. In releases before Release 16.1R7, there is no action taken to recover service PICs from this state unless one of the options for the `flow-control-options` statement is configured, or service PIC is manually restarted.

Usage Guidelines

See *Configuring Flow Monitoring*.

flow-control-queue (Output Congestion Notification)

IN THIS SECTION

- Syntax | 7272
- Hierarchy Level | 7273
- Description | 7273
- Default | 7273
- Options | 7273
- Required Privilege Level | 7273
- Release Information | 7274

Syntax

```
flow-control-queue [ queue | list-of-queues ];
```

Hierarchy Level

```
[edit class-of-service congestion-notification-profile profile-name output ieee-802.1 code-point code-point-bits]
```

Description

Specify one or more output queues to pause, to support priority-based flow control (PFC). The specified queues pause when the interface receives a PFC frame with a matching IEEE 802.1p code point.

Default

Queue 3 (mapped to the fcoe forwarding class) and queue 4 (mapped to the no-loss forwarding class) are programmed as flow control queues to pause. No other output queues are programmed to pause by default.

If you configure flow control queues explicitly, only the queues that you specify are programmed to pause. The explicit flow control queue to pause configuration overrides the default setting, so the queues paused in the default configuration are no longer paused by default.

For example, if you configure queue 2 as a flow control queue, then queue 2 pauses when congestion occurs, but queues 3 and 4 do not pause because they were not explicitly specified. To enable pause on output queues 2, 3, and 4, you must explicitly configure all three of the queues as flow control queues.

The same behavior applies to the IEEE 802.1p code points (priorities) on which PFC is enabled. By default, priorities 3 (011) and 4 (100) are enabled for PFC pause. If you explicitly configure flow control queues to pause, you must also explicitly configure pause for each priority (code point) that you want to pause, because the explicit configuration overrides the default configuration.

Options

[*queue* | *list-of-queues*]—The output queue or a list of output queues to pause.

Required Privilege Level

interfaces—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3.

    }
    remote-ports number;
}
```

Hierarchy Level

```
[edit unified-edge pcef],
[edit services pcef]
```

Description

Specify a service data flow (SDF) filter (flow identifier) that includes one or more filtering parameters (address, protocol, and port) to identify the subscriber traffic that you want the SDF filter to detect. SDF filters are specified in a PCC rule to identify the Layer 3 or Layer 4 IP packet flows that you want to receive a particular treatment.

> **NOTE**: A PCC rule must include at least one SDF filter and can include a maximum of 15 SDF filters.

If you are using Junos OS Subscriber Aware, specify the name of the SDF filter at the `[edit unified-edge pcef]` hierarchy level.

If you are using Junos OS Broadband Subscriber Management, specify the name of the SDF filter at the `[edit services pcef]` hierarchy level.

Options

flow-identifier

Name of the SDF filter.

- **Range:** 1 through 63 characters.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level

For Junos OS Subscriber Aware:

unified-edge—To view this statement in the configuration.

unified-edge-control—To add this statement to the configuration.

For Junos OS Broadband Subscriber Management:

services—To view this statement in the configuration.

services–control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 17.1.

Support at the `[edit services pcef]` hierarchy level introduced for Junos OS Broadband Subscriber Management in Junos OS Release 17.2 on MX Series.

- Release Information | 7282

Syntax

```
flow-detection-mode (automatic | off | on)
```

Hierarchy Level

```
[edit system ddos-protection protocols protocol-group packet-type]
```

Description

(MX Series routers with only MPCs, T4000 Core Routers with only FPC5s, or EX9200 switches) Configure the mode of operation for flow detection for a protocol group or packet type. Use this statement to override global flow detection settings configured with the `flow-detection-mode` statement at the `[edit system ddos-protection global]` hierarchy level. The operation mode is effective only when flow detection is enabled.

Default

The default mode for all protocol groups and packet types is `automatic`.

Options

automatic Detect flows only when the policer is being violated.

off Disable flow detection.

on Always monitor and detect flows, even when the policer is not being violated.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Exporting Flows

Configuring Passive Flow Monitoring

flow-export-rate

IN THIS SECTION

- Syntax | 7286
- Hierarchy Level | 7286
- Description | 7287
- Options | 7287
- Required Privilege Level | 7287
- Release Information | 7287

Syntax

```
flow-export-rate rate;
```

Hierarchy Level

```
[edit forwarding-options sampling instance instance-name family inet output inline-jflow]
```

Description

Specify the flow export rate of monitored packets in kpps. If you have multiple line cards of different types running on the same router, the `flow-export-rate` will be applied to each card. However, the rate applied to the PFEs on the card will vary in accordance with the number of PFEs that are on the card.

On the MX Series, the actual flow export rate might be less than the configured `flow-export-rate`. In addition, the maximum flow export rate for an FPC or MPC module cannot exceed the configured `flow-export-rate`, regardless of how many PICs or MICs are on the module.

Options

rate Flow export rate of monitored packets in kpps (from 1 through 400).

- **Default:** 1 kpps (applies to all PFEs on the FPC)

> **NOTE**: The maximum rate per PFE is 100 kpps for LU, 800 kpps for XL/EA, so for an FPC with four LU PFEs (such as AS cards) you can set a maximum `flow-export-rate` of 400. For an FPC with two LU PFEs (such as the MPC2), the maximum `flow-export-rate` is 200. For an FPC with one LU PFE (such as the MPC5), the maximum is 100. The Junos CLI accepts as valid any value within the range of 1 to 3200, but when applied the value might trigger an error message such as “The configured flow export rate is higher than supported value/chip” in the Junos message log.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 10.2.

flow-export-timer

IN THIS SECTION

- Syntax | 7288
- Hierarchy Level | 7288
- Description | 7288
- Default | 7288
- Options | 7288
- Required Privilege Level | 7289

Syntax

```
flow-export-timer seconds
```

Hierarchy Level

```
[edit system packet-forwarding-options]
```

Description

Configure the flow export period in seconds. The software exports a IPFIX packet periodically at the configured flow-export timer interval. After you configure the flow export period, you must reboot the device for it to take effect.

Default

10 seconds

Options

seconds	Range: 10 to 600 seconds.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

flow-gate

IN THIS SECTION

- Syntax | 7289
- Hierarchy Level | 7289
- Description | 7289
- Options | 7290
- Required Privilege Level | 7290
- Release Information | 7290

Syntax

```
flow-gate {
    maximum amount;
    reserved amount;
}
```

Hierarchy Level

```
[edit system security-profile]
```

Description

Specifies the number of flow gates, also known as `pinholes`, that user logical system administrators and primary logical system administrators can configure for their logical systems, if the security profile is bound to the logical systems.

The primary administrator:

- uses security profiles to provision logical systems with resources.
- binds security profiles to user logical systems and the primary logical system.
- can configure more than one security profile, specifying different amounts of resource allocations in various profiles.

Only the primary administrator can create security profiles and bind them to logical systems.

Options

`maximum` *`amount`*
: A maximum allowed quota. If a logical system requires more of a resource than its reserved amount allows, it can utilize resources configured for the global maximum amount if they are available—that is, if they are not allocated to other logical systems. The maximum allowed quota specifies the portion of the free global resources that the logical system can use. The maximum allowed quota does not guarantee that the amount specified for the resource in the security profile is available. Logical systems compete for global resources.

  - **Range:** 0 through 1000000

`reserved` *`amount`*
: A reserved quota that guarantees that the resource amount specified is always available to the logical system.

  - **Default:** 0

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 11.2.

flow-groups

IN THIS SECTION

- Syntax | 7291
- Hierarchy Level | 7291
- Description | 7291
- Options | 7295
- Required Privilege Level | 7296
- Release Information | 7296

Syntax

```
flow-groups {
    flow-group-name {
        node-device (node-device-name | serial-ID | alias);
        interconnect-device interconnect-device-name;
    }
    node-device (node-device-name | serial-ID | alias) {
        interconnect-device interconnect-device- name {
            preference (high | normal | never);
        }
    }
}
```

Hierarchy Level

```
[edit fabric]
```

Description

In a QFabric system, a hash function is used to select an Interconnect device to forward traffic between two ingress switches, which are called Node devices. Since this hash function is performed on all Interconnect devices, it is possible for redundant multicast streams to flow through one Interconnect

device, making that Interconnect device a potential single point of failure for the redundant flows. Some operations, such as financial transactions, require redundant data flows to use different Interconnect devices to avoid point-of-failure data loss. To enforce this in a fabric, you can create a flow group for multicast or unicast traffic from a particular ingress switch. In a flow group, switches are forced to use different, specified Interconnect devices to forward redundant traffic.

NOTE: The following rules apply to QFabric system flow control:

- A Node device can belong to only one flow group.
- A fabric can contain up to four flow groups.
- Node devices in flow groups can only use the defined Interconnect devices in their flow groups unless all defined Interconnect devices fail. In case of failure, the flow group checks for Interconnect devices with preference set to `normal`—this includes all Interconnect devices in the default group and any Interconnect devices you specifically set to preference `normal`.

The following example creates a flow group. The name of the flow group, test1, is configured first. Next, the Node device TA3713480203 is configured, and the Interconnect device IC-P6603-C is configured last.

```
[edit fabric]
root@qfabric#  set flow-groups ?
Possible completions:
<flow group name>                Flow Group name
+ apply-groups                   Groups from which to inherit configuration data
+ apply-groups-except            Don't inherit configuration data from these groups
> node-device                    Override the link preference for Node device(s)

root@qfabric#  set flow-groups test1 ?
Possible completions:
+ apply-groups                    Groups from which to inherit configuration data
+ apply-groups-except             Don't inherit configuration data from these groups
> interconnect-device             Interconnect device(s) associated with this flow group
> node-device                     Node device(s) associated with this flow group

root@qfabric#  set flow-groups test1 node-device ?

Possible completions:
<node-device-name> Serial ID or alias of node-device
P3686-C                     Node device
TA3713480203                Node device
```

```
TA3713500165                Node device
TA3713500185                Node device
TA3713500307                Node device

root@qfabric# set flow-groups test1 node-device TA3713480203 ?
Possible completions:

<Enter>                            Execute this command
+ apply-group                   Groups from which to inherit configuration data
+ apply-groups-except           Don't inherit configuration data from these groups
|                               Pipe through a command

root@qfabric# set fabric flow-groups test1 node-device TA3713480203

root@qfabric# set flow-groups test1 interconnect-device ?
Possible completions:
<interconnect-device-name>  Serial ID or alias of interconnect-device
IC-P6601-C                  Interconnect device
IC-P6603-C                  Interconnect device

root@qfabric# set flow-groups test1 interconnect-device IC-P6603-C
root@qfabric# show flow-groups
test1 {
    node-device {
        TA3713480203;
    }
    interconnect-device {
        IC-P6603-C;
    }
}
```

The following example overrides the software settings the flow group test1 Node device TA3713500307 was assigned by the software for Interconnect device IC-P6601-C. Node device TA3713500307 has its preference for Interconnect device IC-P6601-C set to `never` by the software, meaning that Node device TA3713500307 can never use Interconnect device IC-P6601-C. You can change this preference so that Interconnect device IC-P6601-C can be used by Node device TA3713500307 if the specifically-configured Interconnect devices all fail. You use the preference option of the `flow-groups` configuration statement to set Interconnect device IC-P6601-C preference to `normal` for Node device TA3713500307.

To configure the preference setting for a Node device to use a particular Interconnnect device, you first select the Node device, then specify the Interconnect device, and finally specify the preference option:

```
[edit fabric]
root@qfabric# set flow-groups ?

Possible completions:
<flow-group name>          Flow Group name
+ apply-groups             Groups from which to inherit configuration data
+ apply-groups-except      Don't inherit configuration data from these groups >
node-device               Override the link preference for Node device(s)
test1                      Flow Group name

root@qfabric# set flow-groups node-device ?

Possible completions:
<name>    serial ID or alias of node-device

P3686-C                     Node device
TA3713480203                Node device
TA3713500185                Node device
TA3713500307                Node device

root@qfabric# set fabric flow-groups node-device TA3713500307 ?
Possible completions:
+ apply-groups            Groups from which to inherit configuration data
+ apply-groups-except     Don't inherit configuration data from these groups
interconnect device

root@qfabric# set fabric flow-groups node-device TA3713500307 interconnect-device ?
Possible completions:
<name>                      Serial ID or alias of interconnect-device
 IC-P6601-C               Interconnect device
 IC-P6603-C               Interconnect device

root@qfabric# set fabric flow-groups node-device TA3713500307 interconnect-device IC-P6601-C
preference ?
Possible completions:
  high                       High link preference
  never                      Never use this link
  normal                     Normal link reference
```

```
root@qfabric# set fabric flow-groups node-device TA3713500307 interconnect-device IC-P6601-C
preference never

root@qfabric# show fabric flow-groups
test1 {
    node-device {
        TA3713480203;
    }
    interconnect-device {
        IC-P6603-C;
    }
}
node-device TA3713500307 {
    interconnect-device IC-P6601-C {
        preference never;
    }
}
```

TIP: To add a TOR to multiple flow groups:
set fabric resources node-device TOR-B interconnect-device IC-A preference HIGH
To configure a TOR to use an Interconnect device from a different flow group if none in the same flow group are available:
set fabric resources node-device TOR-B interconnect-device IC-A preference NORMAL
To increase the priority of default-flowgroup Interconnect devices for a specific TOR:
set fabric resources node-device TOR-A interconnect-device ALL_ICS preference HIGH
To configure default-flowgroup TORs to never use a particular Interconnect device:
Set fabric resources node-device ALL_TORS interconnect-device IC-A preference NEVER

Options

node-device *node-device-name*	Specify a QFabric system ingress Node switch by device name or alias in the QFabric system.
interconnect-device *interconnect-device-name*	Specify a QFabric system Interconnect device name.

preference *preference* Overrides the algorithm results that assign preference to Node devices to use particular Interconnect devices. You can set preference values for these devices to `normal`, `high`, or `never`. (See *Example: Creating a QFabric Flow Group* for more details on setting `preference` values and their meanings.

```

Description

Configure the BGP flow specification for the IPv6 address family to automate coordination of traffic filtering rules and to allow propagation of traffic flow specification rules for IPv6 and IPv6 VPN in order to mitigate distributed denial-of-service attacks. Flow specification provides protection against denial-of-service attacks and restricts bad traffic that consumes bandwidth and stops it near the source.

> **NOTE**: To propagate IPv6 flow specification routes through BGP, enable family `inet6 flow` or `inet6-vpn flow` at the `[edit protocols bgp family]` hierarchy level on BGP routers in the network.

Options

discard-action-for-unresolved-redir-addr	Configure the discard action for BGP flow specification routes that were not resolved using the redirect to IP action.
interface-group *group*<exclude>	Exclude applying flowspec filter to traffic received on specific interfaces. Use **exclude** to specify the interface group where you do not want to receive the traffic.
per-route-accounting	Enable traffic accounting per flowspec route.
no-per-route-accounting	Disable traffic accounting per flowspec route.
destination *ipv6-prefix*	IP destination address field.

destination-port *destination-port-names*

TCP or User Datagram Protocol (UDP) destination port field. You cannot specify both the `port` and `destination-port` match conditions in the same term.

In place of the numeric value, you can specify one of the following text synonyms (the port numbers are also listed): `afs` (1483), `bgp` (179), `biff` (512), `bootpc` (68), `bootps` (67), `cmd` (514), `cvspserver` (2401), `dhcp` (67), `domain` (53), `eklogin` (2105), `ekshell` (2106), `exec` (512), `finger` (79), `ftp` (21), `ftp-data` (20), `http` (80), `https` (443), `ident` (113), `imap` (143), `kerberos-sec` (88), `klogin` (543), `kpasswd` (761), `krb-prop` (754), `krbupdate` (760), `kshell` (544), `ldap` (389), `login` (513), `mobileip-agent` (434), `mobilip-mn` (435), `msdp` (639), `netbios-dgm` (138), `netbios-ns` (137), `netbios-ssn` (139), `nfsd` (2049), `nntp` (119), `ntalk` (518), `ntp` (123), `pop3` (110), `pptp` (1723), `printer` (515), `radacct` (1813), `radius` (1812), `rip` (520), `rkinit` (2108), `smtp` (25), `snmp` (161), `snmptrap` (162), `snpp` (444), `socks` (1080), `ssh` (22), `sunrpc` (111), `syslog` (514), `tacacs-ds` (65), `talk` (517), `telnet` (23), `tftp` (69), `timed` (525), `who` (513), `xdmcp` (177), `zephyr-clt` (2103), or `zephyr-hm` (2104).

dscp *value*

Differentiated Services code point (DSCP). The DiffServ protocol uses the type-of-service (ToS) byte in the IP header. The most significant six bits of this byte form the DSCP.

- **Range:** You can specify DSCP in hexadecimal or decimal form from 0 through 63.

flow-label *numeric-expression*

The value of this field ranges from 0 through 1048575.

This match condition is supported only on Junos devices with enhanced MPCs that are configured for `enhanced-ip` mode.

fragment *fragment-value*

The keywords are grouped by the fragment type with which they are associated:

- `first-fragment`
- `is-fragment`
- `last-fragment`
- `not-a-fragment`

This match condition is supported only on Junos devices with enhanced MPCs that are configured for `enhanced-ip` mode.

icmp6-code *icmp6-code-value*

ICMP6 code field. This value or keyword provides more specific information than `icmp6-type`. Because the value's meaning depends on the associated `icmp6-type` value, you must specify `icmp6-type` along with `icmp6-code`.

In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed). The keywords are grouped by the ICMP type with which they are associated:

- parameter-problem: `ip-header-bad` (0), `required-option-missing` (1)
- redirect: `redirect-for-host` (1), `redirect-for-network` (0), `redirect-for-tos-and-host` (3), `redirect-for-tos-and-net` (2)
- time-exceeded: `ttl-eq-zero-during-reassembly` (1), `ttl-eq-zero-during-transit` (0)
- unreachable: `communication-prohibited-by-filtering` (13), `destination-host-prohibited` (10), `destination-host-unknown` (7), `destination-network-prohibited` (9), `destination-network-unknown` (6), `fragmentation-needed` (4), `host-precedence-violation` (14), `host-unreachable` (1), `host-unreachable-for-TOS` (12), `network-unreachable` (0), `network-unreachable-for-TOS` (11), `port-unreachable` (3), `precedence-cutoff-in-effect` (15), `protocol-unreachable` (2), `source-host-isolated` (8), `source-route-failed` (5)

`icmp6-type` *`icmp6-type-value`*

ICMP6 packet type field. Normally, you specify this match in conjunction with the `protocol` match statement to determine which protocol is being used on the port.

In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed): `echo-reply` (0), `echo-request` (8), `info-reply` (16), `info-request` (15), `mask-request` (17), `mask-reply` (18), `parameter-problem` (12), `redirect` (5), `router-advertisement` (9), `router-solicit` (10), `source-quench` (4), `time-exceeded` (11), `timestamp` (13), `timestamp-reply` (14), or `unreachable` (3).

`packet-length` *`packet-length`*

Total IP packet length value can range from 0 through 65535.

`port` *`port-names`*

TCP or UDP source or destination port field. You cannot specify both the `port` match condition and either the `destination-port` or `source-port` match condition in the same term.

In place of the numeric value, you can specify one of the text synonyms listed under `destination-port`.

prefix-offset *number*

(Optional) Specify the number of bits that must be skipped before Junos OS starts matching the prefix.

This match condition is supported only on Junos devices with enhanced MPCs that are configured for `enhanced-ip` mode.

`protocol` *`number`*

For IPv6, the IP protocol field is supported only on Junos devices with MPCs that are configured for `enhanced-ip` mode. In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed): `ah` (51), `egp` (8),

esp (50), gre (47), icmp (1), igmp (2), ipip (4), ipv6 (41), ospf (89), pim (103), rsvp (46), tcp (6), or udp (17).

source *ipv6-prefix* — IP source address field.

source-port *source-port-names* — TCP or UDP source port field. You cannot specify the port and source-port match conditions in the same term.

In place of the numeric field, you can specify one of the text synonyms listed under destination-port.

tcp-flags *tcp-flags* — TCP header format.

no-install — Prohibit installing received routes in the forwarding table.

accept — Accept a packet. This is the default value.

community *name* — Replace any communities in the route with the specified communities.

discard — Discard a packet silently, without sending an Internet Control Message Protocol (ICMP) message.

mark *value* — Set a DSCP value for traffic that matches this flow. Specify a value from 0 through 63.

This action is supported only on Junos devices with MPCs that are configured for enhanced-ip mode.

> **NOTE**: Junos OS supports traffic marking extended BGP community filtering action. For IPv4 traffic, Junos OS modifies the DiffServ code point (DSCP) bits of a transiting IPv4 packet to the corresponding value of the extended community. For IPv6 packets, Junos OS modifies the first six bits of the traffic class field of the transmitting IPv6 packet to the corresponding value of the extended community.

redirect — Redirect (tunnel) this flow's traffic to given next-hop address.

next-term — Continue to the next match condition for evaluation.

rate-limit *rate-limit* — Limit the bandwidth on the flow route. Express the limit in bits per second (bps).

routing-instance *route-target-extended-community* — Specify a routing instance to which packets are forwarded.

`sample`	Sample the traffic on the flow route.
`traceoptions`	Define tracing operations that track all routing protocol functionality in the routing device.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 16.1.

- Release Information | 7306

Syntax

```
flow-key {
    flow-direction;
    vlan-id;
    output-interface;
}
```

Hierarchy Level

```
[edit services flow-monitoring version9 template template-name],
[edit services flow-monitoring version-ipfix template template-name]
```

Description

Include VLAN IDs in both the ingress and egress directions in the flow key, enable flow direction information in a Version 9 or IPFIX flow template, or both, and configure the output-interface for bridge or VPLS family for inline flow monitoring on the MX Series.

Options

flow-direction Enable reporting of the direction of the flow. The field contains 0x00 (ingress) or 0x01 (egress). The flow direction field in the output record contains the invalid value 0xFF if you do not configure `flow-direction`.

vlan-id Include VLAN IDs in both the ingress and egress directions in the flow key.

output-interface Configure the output-interface field as part of flow-key for bridge or VPLS family.

> **NOTE**: If the output-interface (OIF) is configured under flow-key while the flow-monitoring is in progress, all the existing flows (where OIF was not part of flow-key) report OIF field as zero in the next export. Therefore, in progress configuration of output-interface as part of flow-key is not recommended. In order to configure output-interface as part of flow-key, it is recommended to disable the bridge or vpls sampling and wait for the active flows to become zero.

Required Privilege Level

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 15.2.

`output-interface` option added in Junos OS Release 18.2R1.

name],
[edit routing-instances routing-instance-name protocols vpls]
```

Description

Configure the router to signal the capability to pop the flow label in the receive direction to the remote provider edge (PE) router.

The flow-aware transport of pseudowires (FAT) flow labels enable load-balancing of MPLS packets across equal-cost multipath (ECMP) paths or link aggregation groups (LAGs) without the need for deep packet inspection of the payload. FAT flow labels can be used for LDP-signaled forwarding equivalence class (FEC 128 and FEC 129) pseudowires for virtual private LAN service (VPLS) and virtual private wire service (VPWS) networks.

NOTE:

- Starting with Junos OS Release 16.1, `flow-label-receive` statement is supported for BGP L2VPN and BGP VPLS.
- The `flow-label-receive` statement is not supported in OAM CFM session over Layer 2 circuit.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.1.

- Required Privilege Level | 7310
- Release Information | 7311

Syntax

```
flow-label-receive-static;
```

Hierarchy Level

```
[edit protocols l2circuit neighbor neighbor-id interface interface-name]
[edit routing-instances instance-name protocols evpn],
[edit routing-instances instance-name protocols evpn interface interface-name]
```

Description

Configure the router to pop the flow label on pseudowire packets received from a remote provider edge (PE) router. The ingress PE router inserts the flow label in the pseudowire packet regardless of the information exchanged in the signaling plane. If the egress PE router cannot handle the pseudowire packet with the flow label, it drops the packet.

Flow-aware transport of pseudowires (FAT) flow labels enable load balancing of MPLS packets across equal-cost multipath (ECMP) paths or link aggregation groups (LAGs) without the need for deep packet inspection of the payload. You can use this statement to enable devices to pop FAT flow labels for:

- Forwarding equivalence class (FEC) 128 pseudowires in:
  - Virtual private LAN service (VPLS) networks.
  - Virtual private wire service (VPWS) networks.

  In these cases, configure this statement in the `[edit protocols l2circuit neighbor neighbor-id interface interface-name] hierarchy`.
- Pseudowires in Ethernet VPN (EVPN)-MPLS networks with VPWS (EVPN-VPWS):
  - Globally in an EVPN-VPWS routing instance.

    In this case, configure this statement in the `[edit routing-instances instance-name protocols evpn]` hierarchy.
  - For specific interfaces in an EVPN-VPWS routing instance.

    In this case, configure this statement in the `[edit routing-instances instance-name protocols evpn interface interface-name]` hierarchy.

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 14.1.

Support in a EVPN-VPWS routing instance added in Junos OS Release 21.1R1.

Syntax

```
flow-label-static;
```

Hierarchy Level

```
[edit routing-instances name protocols evpn]
```

Description

For EVPN-MPLS E-LAN services, configure the router to signal the ability to push the flow-aware transport (FAT) flow label on pseudowire packets received from a provider edge (PE) router or to pop the FAT flow label on pseudowire packets transmitted to a PE router. The ingress PE router inserts the flow label in the pseudowire packet regardless of the information exchanged in the signaling plane. If the egress PE router cannot handle the pseudowire packet with the flow label, it drops the packet. A change in FAT flow label configuration is a catastrophic event, causing traffic loss. RFC 6391 describes FAT flow labels and how they are used.

With FAT flow labels, you can load balance known unicast MPLS packets across equal-cost multipath (ECMP) paths or link aggregation groups (LAGs) without the need for deep packet inspection of the payload. You can use this statement to enable devices to pop or push FAT flow labels for these EVPN service types:

- `vlan-based`
- `vlan-bundle`
- `vlan-aware`

Required Privilege Level

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

- Release Information | 7321

Syntax

```
flow-level-detection {
    logical-interface flow-detection-mode;
    physical-interface flow-detection-mode;
    subscriber flow-detection-mode;
}
```

Hierarchy Level

```
[edit system ddos-protection protocols protocol-group packet-type]
```

Description

(MX Series routers with only MPCs, T4000 Core Routers with only FPC5s, or EX9200 switches) Configure the mode of operation for flow detection for the packet type at each flow aggregation level.

The remaining statements are explained separately. See CLI Explorer.

> **NOTE**: Flow detection operates for individual flow aggregation levels only when the flow detection mode at the packet level is configured to either `automatic` or `on`.

Required Privilege Level

admin—To view this statement in the configuration.

admin-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 12.3.

Support for Enhanced Subscriber Management added in Junos OS Release 17.3R1.

flow-monitoring (Inline Monitoring Services)

IN THIS SECTION

- Syntax | 7326
- Hierarchy Level | 7326
- Description | 7326
- Default | 7327
- Options | 7327
- Required Privilege Level | 7328
- Release Information | 7328

Syntax

```
flow-monitoring {
    counter-profile profile-identifier;
    flow-rate kbps burst-size bytes;
    flow-limit number;
    sampling-profile profile-name;
    sampling-rate bytes;
    security-enable;
}
```

Hierarchy Level

```
[edit services inline-monitoring template template-name]
```

Description

Configures optional parameters for flow-based telemetry (FBT) for the EX4100, EX4100-F, and EX4400 switches. FBT enables per-flow-level analytics, using inline monitoring services to create flows, collect them, and export them to a collector. A flow is a sequence of packets that have the same source IP, destination IP, source port, destination port, or protocol on an interface. For each flow, various parameters are collected and sent to a collector using the open standard IPFIX template to organize the

flow. Once there is no active traffic for a flow, the flow is aged out after the configured inactive-timeout period (`flow-inactive-timeout` at the [edit services inline-monitoring template *template-name*] hierarchy level).

Default

Disabled

Options

counter-profile *profile-identifier*

Specify which counters should be exported to the collector, by selecting one of the pre-defined profile names.

- `Per_flow_6_counters`: packet range counter (3 counters), time-to-live (TTL) range counter, TCP window range counter, DoS attack (2 counters)
- `Per_flow_4_counters`: flow packet range (packet size 64 to 1500 bytes) counter (1 count), TTL range counter, TCP window range counter, DoS counter

flow-rate *kbps* burst-size *bytes*

Specify the meter rate for each flow, in kbps, and configure the maximum number of bytes allowed for incoming packets to burst above the flow meter rate.

Range: 8 to 10000000 kbps (flow-rate); 512 to 256000000 bytes (burst-size)

flow-limit *number*

Specify the maximum number of flows allowed.

Range: 0 through 32000

sampling-profile *profile-identifier*

Configure one of the following sampling profiles:

- `First_N_Pkt` : Sample contains the first N packets of a flow
- `Deterministic`: Sample contains every Nth packet of a flow
- `Random`:Sample contains randomly chosen packets from a flow
- `Combo1`: Sample contains the first N packets of a flow, followed by a random packet at the configured interval
- `Combo2`: Sample contains the first N packets of a flow, followed by a Deterministic 1 packet at the configured interval

sampling-rate *bytes*

Specify the rate at which packets are sampled to create flows, in bytes

Range: 1 to 65535 bytes

security-enable Enable security analytics; specify that Denial-of-Service (DoS) attacks are reported to the collector.

Required Privilege Level

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 21.1R1.

```

Description

Determine how the device manages packet flow. The device can regulate packet flow in the following ways:

Options

advanced-options Flow configuration advanced options.

- Values:
  - drop-matching-link-local-address—Drop matching link local address.
  - drop-matching-reserved-ip-address—Drop matching reserved source IP address.
  - reverse-route-packet-mode-vr—Allow reverse route lookup with packet mode vr.

allow-dns-reply Allow unmatched incoming DNS reply packet.

allow-embedded-icmp Allow embedded ICMP packets not matching a session to pass through.

allow-reverse-ecmp Allow reverse ECMP route lookup.

enable-reroute-uniform-link-check Enable reroute check with uniform link.

- Values:
  - nat—Enable NAT check.

enhanced-routing-mode Enable enhanced route scaling.

force-ip-reassembly Force to reassemble IP fragments.

gre-performance-acceleration Accelerate the GRE traffic performance.

ipsec-performance-acceleration Accelerate the IPSec traffic performance.

mcast-buffer-enhance Allow to hold more packets during multicast session creation.

multicast-nh-resolve-retry You can use this command configure the multicast route next-hop resolve attempts. When a multicast route next-hop resolve is unsuccessful, the SRX Series Firewall attempts to resolve the next-hop route based on the specified retry counts.

- **Default:** 0
- **Range:** 0 through 20

no-local-favor-ecmp Does not prefer local node in HA ECMP route lookup.

pending-sess-queue-length Maximum queued length per pending session.

- Values:

- high—Maximum number of queued sessions.
- moderate—Allow more queued sessions than normal.
- normal—Normal number of sessions queued.

power-mode-ipsec Enable power mode ipsec processing.

preserve-incoming-fragment-size Preserve incoming fragment size for egress MTU.

route-change-timeout Timeout value for route change to nonexistent route (seconds).

- **Default:** 6
- **Range:** 6 through 1800

strict-packet-order You can use this command to maintain multicast traffic order and resolve packet drop issue.

syn-flood-protection-mode TCP SYN flood protection mode.

- Values:
  - syn-cookie—Enable SYN cookie protection.
  - syn-proxy—Enable SYN proxy protection.

sync-icmp-session Allow icmp sessions to sync to peer node.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement modified in Junos OS Release 9.5. The `power-mode-ipsec` option added in Junos OS Release 18.3R1 for vSRX Virtual Firewall instances, in Junos OS Release 18.4R1 for SRX4100 and SRX4200 devices, and in Junos OS Release 18.2R2 for SRX5400, SRX5600, and SRX5800 devices. The `multicast-nh-resolve-retry` and the `strict-packet-order` options are added in Junos OS Release 20.2R2 for SRX345 and SRX1500 devices.The `gre-performance-acceleration` option added in Junos OS Release 21.1R1.

Description

Configure the IDP engine to manage the packet flow.

Options

allow-nonsyn-connection Allow TCP non-syn connection.

drop-if-no-policy-loaded Drop all traffic till IDP policy gets loaded.

drop-on-failover Drop traffic on HA failover sessions.

drop-on-limit Drop connections on exceeding resource limits.

fifo-max-size Maximum fifo size.

Sets the maximum FIFO size (range: 1 through 65535).

- **Range:** 1 through 65535

hash-table-size Flow hash table size. Sets the packet flow hash table size.

- **Range:** 1024 through 1000000

idp-bypass-cpu-threshold

CPU usage in percentage for IDP bypass.

- **Default:** 85
- **Range:** 0 through 99

idp-bypass-cpu-tolerance

CPU usage in percentage for IDP bypass.

- **Default:** 5
- **Range:** 1 through 99

idp-bypass-cpu-usg-overload

Enable IDP bypass of sessions or packets on CPU usage overload.

intel-inspect-cpu-usg-threshold

CPU usage threshold percentage for intelligent inspection.

- **Default:** 80
- **Range:** 0 through 99

intel-inspect-cpu-usg-tolerance

CPU usage tolerance percentage for intelligent inspection.

- **Default:** 5
- **Range:** 1 through 99

intel-inspect-disable-content-decompress

Disable payload content decompression.

intel-inspect-enable

Minimize IDP processing during system overload.

intel-inspect-free-mem-threshold

Free memory threshold percentage for intelligent inspection.

- **Default:** 15
- **Range:** 1 through 100

intel-inspect-mem-tolerance

Memory tolerance percentage for intelligent inspection.

- **Default:** 5
- **Range:** 1 through 100

intel-inspect-protocols

Protocols to be processed in intelligent inspection mode.

intel-inspect-session-bytes-depth

Session bytes scanning depth.

- **Default:** 0

- **Range:** 0 through 1000000

intel-inspect-signature-severity

Signature severities to be considered for IDP processing.

- Values:
  - critical
  - major
  - minor

log-errors

Enable the error log to generate the result of success or failure about the flow. A flow-related error is when IDP receives a packet that does not fit into the expected flow. By default an error log is enabled.

max-sessions-offset

Maximum session offset limit percentage.

Set an offset (percentage) for the maximum IDP session limit. The `max-sessions-offset` option sets an offset for the maximum IDP session limit. When the number of IDP sessions exceeds the maximum session limit, a warning is logged that conditions exist where IDP sessions could be dropped. When the number of IDP sessions drops below the maximum IDP session limit minus the offset value, a message is logged that conditions have returned to normal.

- **Range:** 0 through 99

max-timers-poll-ticks

Specify the time at which timer ticks at regular interval.

- **Syntax:** *value*—Maximum amount of time at which the timer ticks.
- **Range:** 0 through 1000 ticks
- **Default:** 1000 ticks

min-objcache-limit-lt

Memory lower threshold limit percentage.

- **Syntax:** *value*— Memory lower threshold limit percentage.
- **Range:** 1 through 100

min-objcache-limit-ut

Memory upper threshold limit percentage.

- **Syntax:** *value*— Memory upper threshold limit percentage.
- **Range:** 1 through 100

no-log-errors

Do not flow log errors.

reject-timeout

Specify the amount of time in seconds within which a response must be received.

This time-out is applied on flow when drop-connection action is taken by IPS for TCP flow.

- **Syntax:** *value*—Maximum amount of time in seconds.
- **Range:** 1 through 65535
- **Default:** 300 seconds

reset-on-policy

IDP keeps track of connections in a table. If enabled, the security module resets the flow table each time a security policy loads or unloads. If this setting is disabled, then the security module continues to retain a previous security policy until all flows referencing that security policy go away. Juniper Networks recommends that you keep this setting enabled to preserve memory.

When a new IDP policy is loaded, the existing sessions are inspected using the newly loaded policy and the existing sessions not ignored for IDP processing. The `reset-on-policy` command is used to decide whether to continue the IDP inspection with the newly loaded IDP policy or not. This command is disabled by default and all the existing sessions continue to be inspected with newly loaded IDP policy.

> **NOTE**: In Junos OS Release 18.2R1-S1and Junos OS Release 18.3R1, the `no-reset-on-policy` option is not supported on SRX5000 line of devices with SRX5K-SPC3.

session-steering

Session steering for session anticipation.

udp-anticipated-timeout

Sets the maximum UDP anticipated timeout value.

- **Range:** 1 through 65535

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

security—To view this statement in the configuration.

security-control—To add this statement to the configuration.

Release Information

Statement introduced in Junos OS Release 9.2.

Options intel-inspect-cpu-usg-threshold, intel-inspect-cpu-usg-tolerance, intel-inspect-disable-content-decompress, intel-inspect-enable, intel-inspect-free-mem-threshold, intel-inspect-mem-tolerance, intel-inspect-protocols, intel-inspect-session-bytes-depth, and intel-inspect-signature-severity options added in Junos OS Release 19.2R1.

Starting in Junos OS Release 18.4R1, the `reset-on-policy` command is deprecated—rather than immediately removed—to provide backward compatibility and a chance to bring your configuration into compliance with the new configuration.
