# Junos OS Evolved Release Notes for ACX Series

## IN THIS SECTION

- [What's New | 1](#)
- [What's Changed | 1](#)
- [Known Limitations | 3](#)
- [Open Issues | 4](#)
- [Resolved Issues | 7](#)

These release notes accompany Junos OS Evolved Release 23.4R2 for ACX7024, ACX7024X, ACX7100-32C, ACX7100-48L, ACX7332, ACX7348, and ACX7509 devices. They describe new and changed features, limitations, and known and resolved problems in the hardware and software.

## What's New

There are no new features or enhancements to existing features in this release for ACX Series routers.

## What's Changed

### IN THIS SECTION

- [EVPN | 2](#)
- [Infrastructure | 2](#)
- [Junos OS API and Scripting | 2](#)
- [System Management | 3](#)
- [VPNs | 3](#)

Learn about what changed in this release for ACX Series routers.

## EVPN

- **Updates to syslog EVPN\_DUPLICATE\_MAC messages**—EVPN\_DUPLICATE\_MAC messages in the System log (syslog) now contain additional information to help identify the location of a duplicate MAC address in an EVPN network. These messages will include the following in addition to the duplicate MAC address:
  - The peer device, if the duplicate MAC address is from a remote VXLAN tunnel endpoint (VTEP).
  - The VLAN or virtual network identifier (VNI) value.
  - The source interface name for the corresponding local interface or multihoming Ethernet segment identifier (ESI).

For example: Feb 27 22:55:13 DEVICE\_VTEP1\_RE rpd 39839: EVPN\_DUPLICATE\_MAC: MAC address move detected for 00:01:02:03:04:03 within instance=evpn-vxlan on VNI=100 from 10.255.1.4 to ge-0/0/1.0.

For more on supported syslog messages, see [System Log Explorer](#).

## Infrastructure

- **Option to disable path MTU discovery**—Path MTU discovery is enabled by default. To disable it for IPv4 traffic, you can configure the `no-path-mtu-discovery` statement at the `edit system internet-options` hierarchy level. To reenabling it, use the `path-mtu-discovery` statement.

[See [Path MTU Discovery](#).]

## Junos OS API and Scripting

- **<get-trace> RPC support removed (ACX Series, PTX Series, and QFX Series)**—The `show trace application app-name` operational command and equivalent `<get-trace> RPC` both emit raw trace data. Because the `<get-trace> RPC` does not emit XML data, we've removed support for the `<get-trace> RPC` for XML clients.

## System Management

- **Additional Upgrade fields for the show system applications detail command (ACX Series, PTX Series, and QFX Series)**—The show system applications detail command and corresponding RPC include additional Upgrade output fields. The fields provide information about notifications and actions related to various upgrade activities.

[See [show system applications \(Junos OS Evolved\)](#).]

## VPNs

- **Increase in revert-delay timer range**— The revert-delay timer range is increased to 600 seconds from 20 seconds.

[See [min-rate](#).]

## Known Limitations

### IN THIS SECTION

- [General Routing | 3](#)
- [Routing Protocols | 4](#)

Learn about limitations in this release for ACX Series routers.

For the most complete and latest information about known Junos OS Evolved defects, use the Juniper Networks online [Junos Problem Report Search](#) application.

## General Routing

- IPv6 precedence classifier, rewrite CLI is not supported for ACX7000 platforms.[PR1587002](#)

- For queues without any guaranteed bandwidth configured, no queue drop counter statistics could be displayed in the case of continuous traffic congestion. This includes those packets getting dropped on queues due to the fact that:
  - Other queue(s) have 100% of bandwidth configured.
  - Other queue(s) are configured as priority queue(s) without any shaper.

Traffic flow behaviour is as expected per configuration and no impact due to this issue. [PR1732194](#)

- While disabling and enabling all the lanes of 400G optics together, carrier transition count on random lanes might get incremented. There is no functional impact. [PR1779602](#)

## Routing Protocols

- Pruned route entries are not programmed in the case of inclusive tunnels without local receivers. Traffic is dropped in the ingress stage in the PE, hence route resolve does not happen. Thus, this multicast route is not maintained in RPD and the Packet Forwarding Engine. [PR1742233](#)

## Open Issues

### IN THIS SECTION

- [General Routing | 5](#)
- [Routing Protocols | 6](#)

Learn about open issues in this release for ACX Series routers

For the most complete and latest information about known Junos OS Evolved defects, use the Juniper Networks online [Junos Problem Report Search](#) application.

## General Routing

- ACX7509 systems have the ability to do automatic fault-based switchovers when traffic impacting faults are seen on the primary Routing Engine or primary FEB. This ability needs to be disabled if the backup Routing Engine is disabled for primary role.

Suppose a user has disabled RE0 for primary role as follows: `set chassis redundancy routing-engine 0 disabled`. This prevents RE0 from becoming the primary on system boot. Instead RE1 becomes the primary. Under this scenario, an automatic fault-based switchover from RE1 to RE0 can still happen. The workaround is to disable automatic fault-based switchovers also as follows: `set chassis redundancy failover disable`. [PR1713851](#).

- We observe core file with rpd with BGP flowspec if secondary-independent-resolution is configured. [PR1722715](#)
- On Junos OS Evolved ACX platforms with GRES (Graceful Routing Engine switchover), after performing GRES switchover `jdhcpd` does not start on the new primary RE (Routing Engine) due to which DHCPv4/v6 (Dynamic Host Configuration Protocol) session binding is lost resulting in traffic loss. [PR1740530](#)
- `show pfe statistics traffic` command displays 0 in Input packets: and Output packets: after Packet Forwarding Engine app (`evo-pfemand`) restart for some time. Correct values are displayed after the delay. [PR1745512](#)
- On Junos OS Evolved ACX platforms configured with EVPN-MPLS (Ethernet VPN-Multiprotocol Label Switching) vlan-based EVPN service or EVPN-VXLAN (Ethernet VPN-Virtual Extensible LAN), device does not respond to ARP/ND (Address Resolution Protocol/Neighbor Discovery) without any vlan-id tag. Due to this, the ARP or ND response packet gets dropped in LAN network and the local host is not able to resolve the ARP. [PR1751135](#)
- On ACX7348 and ACX7332 series running Junos OS Evolved, multiple Routing Engine switchover can cause IDEEPROM failure on FPC and PSM, which results in PSM and FPC shown as unsupported. [PR1760978](#)
- CFM sessions when scaled on ACX7000 Junos OS Evolved Series can get stuck in OK state on catastrophic events which can result in CCM timeouts at the same time. It can be recovered with CFMD process restart [PR1768708](#)
- When the chassis is headless (No Routing Engines), the behaviour of LEDs in that case is not deterministic. [PR1769719](#)
- When DHCP traceoptions is enabled, there is a possibility that `jdhcpd` could generate a core file. It is recommended to enable them only for debugging purpose and disable it immediately once debugging is done. [PR1771121](#)

- On Junos OS Evolved ACX Series platform in EVPN (Ethernet Virtual Private Network)-VXLAN (Virtual Extensible Local Area Network) scenario in L3VRFs (Virtual Routing and Forwarding) configured with RIB (Routing Information Base) group for route leaks when routing-options multipath is configured the, Type-5 routes advertised through the VRF does not work. There is an impact on the traffic in the VRF when this issue is encountered.[PR1773240](#)
- Multihop BFD packets by default uses the network-control queue in Junos OS Evolved ACX Series. This setting remains same despite configuring the host-outbound-traffic to a different forwarding-class.[PR1776127](#)
- Junos Evolved based ACX node acting as ASBR+PE (Autonomous System Border Router + Provider Edge) in MPLS L3VPN (Layer 3 VPN) Inter-AS Option B or C does not install VPN label encapsulation in the Packet Forwarding Engine. Traffic is impacted due to this issue.[PR1794718](#)
- When multicast packets are transiting ACX7100 devices through VXLAN VTEP or core interface without multicast configurations, errors are seen. Suggested to use DDOS configurations provide with WA. [PR1796501](#)
- Under certain conditions when DHCP configuration is completely removed, the session database is left in an unusable state. On subsequent reconfiguration of DHCP, subscriber logins fail. In this case a system reboot is required. [PR1816246](#)
- ACX7348::Telemetry :: Few of the sensors do not get streamed for /components/component/. [PR1817427](#)
- [evpn-vxlan][dcf12] ACX DC-GW not forwarding traffic received from remote DC-GW after trigger test. [PR1817677](#)

## Routing Protocols

- BGP passing next-hop path's weight as 0 first and then passing next-hop path's weight as 1 later causes KRT to create 2 different next hops (as weight is now part of next-hop key) and results in installing same route in FIB as primary and backup. [PR1745661](#)
- Configuration of a global AS number is necessary when route target filter is enabled. Currently Junos OS does not enforce configuring a global AS number and it has been the behavior for a long time. Many unexpected issues might be seen without a global AS number. It's been a recommended practice to configure a global AS number in the field. [PR1783375](#)

## Resolved Issues

### IN THIS SECTION

- [General Routing | 7](#)
- [Infrastructure | 10](#)
- [Interfaces and Chassis | 11](#)
- [Layer 2 Features | 11](#)
- [User Interface and Configuration | 11](#)

Learn about the issues fixed in this release for ACX Series routers.

For the most complete and latest information about known Junos OS Evolved defects, use the Juniper Networks online [Junos Problem Report Search](#) application.

## General Routing

- G.8275.1- G.8273.2 1PPS cTE performance test might be marginally outside class-C intermittently on ACX7100-48L. [PR1607381](#)
- QSFP28-DD-2X100GBASE-LR4 link down on multiple FPC restarts or system reboots. [PR1685520](#)
- ACX reports `/psm/0/ hwdre/0/cm/0/ psm_mcu /psm0/psm_cml_cmd_fault` even though the PSM is in working order. [PR1700839](#)
- We observe continuous ssh errors on log messages (error: Could not load host key: `/etc/ssh/ssh_host_ec_p521_key`). [PR1744354](#)
- Port speed delete is resulting in setting the it to the default speed [PR1748138](#)
- We observe spikes in 1pps performance during long run testing. [PR1761078](#)
- 100G/400G ports do not come up after performing changes on ACX7332 and ACX7348 platforms. [PR1762315](#)
- Any MPLS encapsulated packet with a size less than and equal to 35 bytes gets dropped. [PR1766889](#)
- The xinted generates syslog messages `service ssh, accept: Invalid argument (errno = 22)` with high cpu usage. [PR1767072](#)

- All Junos OS Evolved platforms - ifmon process 100% utilization. [PR1768113](#)
- Unknown unicast IPv4 Traffic received with UDP destination port 8503 is flooded back to Source PE. [PR1768729](#)
- IPTV traffic is not forwarded to test agent. [PR1771527](#)
- CRC errors observed with SFT-T (740-013111 & 740-027085) Optics. [PR1771671](#)
- IPv6 Neighbor Discovery not working resulting in traffic loss. [PR1772838](#)
- Traffic forwarding is affected over physical interface if user tries to configure hierarchical-scheduler configuration statement on aggregated Ethernet member interface. [PR1773980](#)
- [Clocking Solution]:ACX7348: PTP and SyncE does not working properly after Routing Engine switch over. [PR1775585](#)
- ACX7348:ACX7332 - Remote interfaces do not go down when chassis is runs headless (with both Routing Engines plugged out from chassis).[PR1775785](#)
- In the scaled Layer 2circuit configured with Layer 2 circuit redundancy configuration,traffic drops might be observed. [PR1775809](#)
- Aggregated Ethernet load balancing issue on Junos Evolved ACX7000 platforms. [PR1775867](#)
- BFD session flaps for member interfaces of the aggregated Ethernet are in multiple line cards. [PR1776647](#)
- Traffic drop is seen in EVPN-MPLS aliasing scenario when underlay unilist is modified. [PR1776945](#)
- Traffic drops are observed when the aggregated Ethernet link flap in the L2VPN scenario. [PR1777608](#)
- clockd core file at `ibdmf::Board::enqueue_event` with restart of FPC multiple times. [PR1778163](#)
- Junos OS Evolved: Name resolution does not happen for `show arp` output. [PR1778567](#)
- After swtichover with MPLS FRR with VPLS configured, it is observed that traffic to a few VPLS instances is dropped. [PR1779466](#)
- Traffic is dropped when `packet-forwarding-options` is configured along with VRF and management VRF configurations. [PR1779524](#)
- CLI configuration statement to enable or disable auto recovery of layer 2 learning module in Junos OS Evolved platforms. [PR1779797](#)
- Ungraceful FPC removal from chassis causes `hwdre` crash and process stops leading to FPC in fault state. [PR1781493](#)

- Multicast traffic is not forwarded to the NG-MVPN core. [PR1781735](#)
- Traffic disruption is seen when IRB is present within ERPS protected bridge domain. [PR1782190](#)
- ACX7509 shows PLL alarms after an Routing Engine switch. [PR1782380](#)
- ACX7024 does not boot after request system zeroize. [PR1783542](#)
- PTP remains in ACQUIRING state. [PR1783545](#)
- Junos OS Evolved: ACX7000 Series: Protocol specific DDoS configuration affects other protocols (CVE-2024-39531). [PR1784343](#)
- Policy-based routing does not work as intended when it is configured with next-ip or next-ip6 on all ACX Junos OS Evolved platforms except ACX7024. [PR1784909](#)
- STP bridge domain or ERPS protected domain configured on the IRB interface causes traffic to be dropped. [PR1784990](#)
- Route leaks between VRFs through the RIB group does not work as expected. [PR1786295](#)
- CFM configuration with multiple MEP under same maintenance-association causes evo-pfemand process crash and CFM session might not come up. [PR1786395](#)
- Autoneg configuration for 1G optical does not turn on upon inspecting PHY registers. [PR1787154](#)
- On ACX7348, after system reboot or Routing Engine switchover, syslog messages with "ddsType = "RouteCcc" tpName = "BrcmRtCcc"" are seen. These messages don't cause any service or traffic impact. [PR1787689](#)
- Interfaces with QSFP-100GBASE-LR4 optics might not come up after software upgrade or system reboot. [PR1788848](#)
- The evo-pfemand process crashes on Junos OS Evolved ACX platforms. [PR1791199](#)
- Junos ping inet command does not force IPv4 in Junos OS Evolved platforms. [PR1792415](#)
- Error messages are populate `getQosRewriteHwMapIdFromIfIndex` and interface ifd queue statistics traffic goes to the wrong queue. [PR1793256](#)
- FPCs are not recovered when system is rebooted right after Routing Engine switchover due to evo-pfemand crash. [PR1797593](#)
- Traffic drops observed in the Layer 2 circuit or Layer 2 VPN scenario. [PR1797839](#)
- Traffic drops are seen on all Junos OS Evolved platforms. [PR1798446](#)
- Multiple create or delete of physical interface, L3 and MACsec interfaces blocks MACsec traffic on Junos Evolved platforms. [PR1800139](#)

- On ACX platforms running Junos OS Evolved, the device gets powered down due to incorrect reading of a temperature sensor, impacting all the services running on the box. [PR1801225](#)
- [Junos OS Evolved] **Host 0 Disk 1 Labelled incorrectly** alarm is sometimes set and cleared in 5 seconds [PR1801436](#)
- In platform ACX7509 after switchover, STP states re-converge even with NSB enabled. [PR1801786](#)
- The rpd process crashes when Routing Instance type changes from L2 to L3 or vice versa. [PR1802000](#)
- CB goes into fault state after system Routing Engine power off or on using button press. [PR1802508](#)
- On Junos Evolved ACX7000 platforms configured with MPLS tunnel and Storm Control, the Layer 2 or MPLS tunnel-terminated known unicast traffic arriving at the ingress interface assigned with a high drop precedence by the interface-level classifier gets dropped on the interface where storm control profile is active. Due to this, MPLS tunnel traffic might get affected. [PR1802525](#)
- [ACX7000] With IPSEC-Ah configuration enabled, OSPF or OSPF3 session does not work. [PR1803437](#)
- Some timing features do not work as intended with PLL input and lock failure alarms on Junos OS Evolved platforms after Routing and Control Board jack in and switchover. [PR1803481](#)
- ACX7000: Post instance renaming, VPLS MACs stopped exchanging over MPLS core or LSI interface. [PR1805586](#)
- ACX7024 Timing : T-GM performance shows 1second time offset. [PR1808134](#)
- L2ald-agent generates core file and IRB logical interface stays Hardware-down after deletion of IRB (with virtual-gateway-address configuration) , reading same virtual-gateway-address as IRB address and move back to IRB with same virtual-gateway-address. [PR1808779](#)
- OSPFv3 neighborship is not getting established on IRB when mld snooping is enabled for the BD on which IRB is hosted. [PR1816540](#)

## Infrastructure

- DNS resolution does not work for default instance when name server is reachable through mgmt\_junos VRF. [PR1766212](#)

## Interfaces and Chassis

- On the ACX7024 platform, the tear-down rate is low. This is due to system CPU limitations. [PR1659593](#)
- Multiple processes crash when more than 150 VLAN entries are configured in vlan-id-list under aggregated Ethernet logical interface. [PR1774222](#)

## Layer 2 Features

- MAC learning has been rejected due to mismatch between I2ald and PFE STP index value in VPLS. [PR1766991](#)

## User Interface and Configuration

- Configuration archival through FTP, does not work with presence of firewall filter on the loopback interface even when FTP ports are allowed. [PR1798464](#)

# Junos OS Evolved Release Notes for PTX Series

### IN THIS SECTION

- [What's New in 23.4R2-S1 | 12](#)
- [What's New in 23.4R2 | 67](#)
- [What's Changed | 68](#)
- [Known Limitations | 70](#)
- [Open Issues | 71](#)
- [Resolved Issues | 76](#)

These release notes accompany Junos OS Evolved Release 23.4R2 for PTX10001-36MR, PTX10003, PTX10004, PTX10008, and PTX10016, Packet Transport Routers. They describe new and changed features, limitations, and known and resolved problems in the hardware and software.

## What's New in 23.4R2-S1

### IN THIS SECTION

Learn about new features introduced in this release for PTX Series routers.

### Hardware

- **New PTX10002-36QDD router (PTX Series)**—In Junos OS Evolved Release 23.4R2-S1, we introduce the PTX10002-36QDD router. It is a fixed-configuration router that features 36 high-density and cost-efficient 800-Gigabit Ethernet ports network ports in a 2-U form factor. With 28.8 terabits per second (Tbps) of throughput, the PTX10002-36QDD is optimally designed for peering, core routing, and infrastructure edge routing roles in cloud provider, service provider, and content provider networks.

The router supports 2200-W or 3000-W high-voltage HVAC/HVDC and DC power supply units and front-to-back airflow.

You can channelize the ports on the PTX10002-36QDD and increase the number of interfaces.

To install the PTX10002-36QDD router and perform initial configuration, routine maintenance, and troubleshooting, see the [PTX10002-36QDD Hardware Guide](#). See [Feature Explorer](#) for the complete list of features for any platform.

Table 1: Features Supported on the PTX10002-36QDD

Feature	Description
Chassis	<ul style="list-style-type: none"> <li>• Support for the following chassis management functionalities: <ul style="list-style-type: none"> <li>• The presence of two ASIC packages enables you to take a Flexible PIC Concentrator (FPC) online or offline or to restart the FPC without impacting the power to the FPC.</li> <li>• When you connect 3000-watt (W) power supply units (PSUs), the system operates in normal power mode. You can change the operating power mode from normal to power-optimized by using the command <code>set chassis mode power-optimized</code>.</li> <li>• The <code>show chassis fpc</code> command displays both PFE and PFE-Instance details.</li> <li>• On the router, when you run the <code>request chassis fpc</code> command, you must use <code>pfe</code> instead of <code>pfe-instance</code> to control the FPC operations. Also, when you run the <code>request chassis fpc</code> command, you must commit the command for both the PFEs that are present.</li> </ul> </li> </ul> <p>[See <a href="#">Power Mode Management on PTX10002-36QDD</a>, <a href="#">chassis</a>, <a href="#">request chassis fpc</a>, and <a href="#">show chassis fpc</a>.]</p> <ul style="list-style-type: none"> <li>• Supports resiliency features to manage fabric faults, including but not limited to: <ul style="list-style-type: none"> <li>• Auto-heal functionality to recover the faulty link by fixing the errors automatically.</li> <li>• Disables all Packet Forwarding Engines when the number of fabric link errors exceeds four in the system.</li> </ul> </li> </ul> <p>You can use the existing CLI commands for the fabric management. The following commands display new or different fields in their outputs:</p> <ul style="list-style-type: none"> <li>• <code>show chassis fabric fpcs</code> displays peer FPC/PFE details because the Packet Forwarding Engines are directly connected to each other.</li> </ul>

Table 1: Features Supported on the PTX10002-36QDD (Continued)

Feature	Description
	<ul style="list-style-type: none"> <li>• show chassis fabric topology displays only physical link connectivity.</li> </ul> <p>[See <a href="#">Chassis-Level User Guide</a>, <a href="#">show chassis fabric fpcs</a>, and <a href="#">show chassis fabric topology</a>.]</p> <ul style="list-style-type: none"> <li>• Optics EM policy support. We've extended the Junos Environment Monitoring (EM) policy to include optics temperature sensors for PTX10002-36QDD routers. It includes the following features: <ul style="list-style-type: none"> <li>• The Optics EM policy incorporates periodically polled temperature readings of optical modules in the system to automatically manage the fan speed.</li> <li>• Junos OS Evolved will automatically trigger optics shutdown for 100GbE, 400GbE, and 800GbE optics when the Fire Shutdown threshold is breached. Auto-recovery is not supported for optics disabled by the EM policy. To re-enable the optics, use the request interface optics-reset command or perform soft optics insertion and removal (OIR).</li> <li>• EM policy is enabled by default on all 100GbE, 400GbE, and 800GbE optics that are Multi-source Agreements (MSA) compliant and support diag EEPROM with temperature monitoring. This policy is not applicable for loopback optics and direct attach copper (DAC) cables.</li> </ul> <p>To disable EM policy or view temperature threshold values, use the following CLI commands:</p> <ul style="list-style-type: none"> <li>• set chassis fpc <i>fpc_slot</i> pic <i>pic_slot</i> port <i>port_no</i> no-temperature-monitoring explicitly disables the EM policy on specific WAN ports.</li> <li>• show chassis temperature-thresholds displays the optics temperature threshold values.</li> <li>• show chassis environment displays the optics temperature.</li> </ul> <p>[See <a href="#">chassis-adc-temperature-sensor</a>.]</p> </li> </ul>

Table 1: Features Supported on the PTX10002-36QDD (Continued)

Feature	Description
	<ul style="list-style-type: none"> <li>• Routing Engine support. The fixed-configuration PTX10002-36QDD router supports an inbuilt Routing Engine represented by the model number RE-JNP10002-36QDD in the CLI.</li> </ul> <p>The router does not support: the following operational commands:</p> <ul style="list-style-type: none"> <li>• A pluggable Routing Engine</li> <li>• Graceful Routing Engine switchover (GRES), as the router does not have a redundant Routing Engine</li> <li>• The following operational commands: <ul style="list-style-type: none"> <li>• request chassis routing-engine master acquire</li> <li>• request chassis routing-engine master release</li> </ul> </li> </ul> <p>[See <a href="#">show chassis hardware</a>.]</p> <ul style="list-style-type: none"> <li>• Routing Engine resiliency. We've enabled Routing Engine resiliency for the faults related to CPU memory and DIMM. The Routing Engine supports fault-handling actions such as logging errors, raising alarms, sending SNMP traps, and providing indication about an error through the LEDs.</li> </ul> <p>[See <a href="#">show system errors active</a>.]</p> <ul style="list-style-type: none"> <li>• Support for fabric platform resiliency includes resiliency functionality to manage hardware components such as the FPC, PSUs, and fan.</li> </ul> <p>[See <a href="#">show chassis power detail</a>, <a href="#">show chassis fpc</a>, and <a href="#">show chassis fan</a>.]</p> <ul style="list-style-type: none"> <li>• Packet Forwarding Engine resiliency. The software detects, reports, and takes action on Packet Forwarding Engine faults. Actions are taken based on the default configuration or user configuration available for the errors.</li> </ul> <p>[See <a href="#">show system errors active</a>.]</p>

Table 1: Features Supported on the PTX10002-36QDD (Continued)

Feature	Description
Class of service	<ul style="list-style-type: none"> <li>• Support for class-of-service (CoS) features, including classifiers (behavior aggregate (BA), fixed, and multifield (MF)), rewrite rules, forwarding classes, loss priorities, transmission scheduling, rate control, and drop profiles.</li> </ul> <p>[See <a href="#">CoS Features and Limitations on PTX Series Routers</a>.]</p> <ul style="list-style-type: none"> <li>• Support for priority-based flow control (PFC) watchdog, which detects and mitigates PFC pause storms received for PFC-enabled queues.</li> </ul> <p>A table called <code>jnxCosWatchdogTxQueueTable</code> is added to the SNMP class-of-service (CoS) MIB to show statistics for transmitting PFC queues related to the PFC watchdog. Table entries are indicated by <code>jnxCosWatchdogTxQueueEntry</code> and contain the following objects:</p> <ul style="list-style-type: none"> <li>• <code>jnxCosWatchdogIfIndex</code>—The index of an interface on which PFC and PFC watchdog are enabled.</li> <li>• <code>jnxCosWatchdogTxQueueId</code>—The ID of the queue of the PFC-enabled interface.</li> <li>• <code>jnxCosWatchdogTxQueueRecoveredCount</code>—The number of times a queue recovered after a PFC pause storm.</li> <li>• <code>jnxCosWatchdogTotalPktDrop</code>—The total number of packets dropped due to PFC pause storm mitigation since the device was started.</li> <li>• <code>jnxCosWatchdogLastPktDrop</code>—The number of packets dropped due to the last PFC pause storm.</li> </ul> <p>[See <a href="#">SNMP MIBs and Traps Supported by Junos OS and Junos OS Evolved</a> and <a href="#">PFC Watchdog</a>.]</p> <ul style="list-style-type: none"> <li>• Support for importing existing classifier and rewrite rules to form new rules.</li> <li>• Support for priority-based flow control (PFC) at Layer 3 for untagged traffic and explicit congestion notification (ECN).</li> </ul>

Table 1: Features Supported on the PTX10002-36QDD (Continued)

Feature	Description
	<p data-bbox="753 354 1398 420">[See <a href="#">Understanding PFC Using DSCP at Layer 3 for Untagged Traffic</a> and <a href="#">CoS Explicit Congestion Notification</a>.]</p> <ul data-bbox="719 457 1419 661" style="list-style-type: none"> <li>• Queue-depth monitoring support for virtual output queues. Virtual output queue (VOQ) queue-depth monitoring, or latency monitoring, measures peak queue occupancy of a VOQ. Junos OS Evolved supports VOQ queue-depth monitoring to report peak queue length for a given physical interface for each Packet Forwarding Engine.</li> </ul> <p data-bbox="753 695 1143 722">[See <a href="#">VOQ Queue-depth Monitoring</a>.]</p> <ul data-bbox="719 760 1403 1197" style="list-style-type: none"> <li>• Support for export of physical interface queue statistics to an outside collector. Use UDP (native) streaming, remote procedure call (gRPC) services, or gRPC network management interface (gNMI) services by using the sensor/<b>junos/system/linecard/interface/queue/</b>. Each physical interface has eight queues. The following counters are exported as part of this sensor for all configured physical interfaces: <ul data-bbox="753 1037 1235 1197" style="list-style-type: none"> <li>• Transmitted packets and transmitted bytes</li> <li>• Red drop packets and bytes</li> <li>• Tail drop packets and bytes</li> </ul> </li> </ul> <p data-bbox="753 1234 1365 1331">This feature includes zero suppression support. It does not include support for summed up counters on aggregated Ethernet (ae) interfaces.</p> <p data-bbox="753 1365 1360 1430">[See <a href="#">sensor (Junos Telemetry Interface)</a> and <a href="#">Guidelines for gRPC and gNMI Sensors (Junos Telemetry Interface)</a>.]</p> <ul data-bbox="719 1467 1419 1707" style="list-style-type: none"> <li>• Hierarchical CoS support. The router supports up to four levels of scheduling on an interface (physical interfaces, logical interface sets, logical interfaces, and queues). The router does not support hierarchical CoS on integrated routing and bridging (IRB) or aggregated Ethernet interfaces. Also, hierarchical CoS schedulers should not include buffer or drop profile configurations.</li> </ul>

Table 1: Features Supported on the PTX10002-36QDD (Continued)

Feature	Description
	<p>To enable hierarchical scheduling, set <code>hierarchical-scheduler</code> at the <code>[edit interfaces interface-name ]</code> hierarchy level.</p> <p>[See <a href="#">Hierarchical Class of Service in ACX Series Routers</a>.]</p> <ul style="list-style-type: none"> <li>• Support for classification override configured under a forwarding policy.</li> </ul> <p>[See <a href="#">CoS Features and Limitations on PTX Series Routers and Overriding the Input Classification</a>.]</p>
Dynamic Host Configuration Protocol	<ul style="list-style-type: none"> <li>• DHCPv4 Relay Agent and DHCPv6 Relay Agent are supported. Features included are: <ul style="list-style-type: none"> <li>• DHCP Relay: Layer 3 (L3) interfaces</li> <li>• DHCP Relay: Option 82 for Layer 2 VLANs</li> <li>• DHCP Relay: Option 82 for L3 interfaces</li> <li>• Extended DHCP Relay Agent</li> <li>• Virtual router-aware DHCP (VR-aware DHCP)</li> </ul> </li> </ul> <p>[See <a href="#">Extended DHCP Relay Agent Overview</a>.]</p>
Hardware	<ul style="list-style-type: none"> <li>• Supported transceivers, optical interfaces, and DAC cables. Select your product in the Hardware Compatibility Tool to view supported transceivers, optical interfaces, and DAC cables for your platform or interface module. We update the HCT and provide the first supported release information when the optic becomes available.</li> </ul> <p>[See <a href="#">Hardware Compatibility Tool</a> .]</p>

Table 1: Features Supported on the PTX10002-36QDD (Continued)

Feature	Description
High availability and resiliency	<ul style="list-style-type: none"> <li>• BFD support, including: <ul style="list-style-type: none"> <li>• Distributed BFD and BFD-triggered local repair (BFD authentication is not supported.)</li> <li>• Independent micro BFD sessions enabled on a per-member link basis for a LAG bundle</li> <li>• Inline BFD</li> </ul> <p>[See <a href="#">Understanding BFD</a> .]</p> </li> <li>• Support for IP-over-IP encapsulation to facilitate IP overlay construction over an IP transport network.—An IP network contains edge devices and core devices. To achieve higher scale and reliability among these devices, use an overlay encapsulation to logically isolate the core network from the external network that the edge devices interact with.</li> </ul> <p>Static configuration or a BGP protocol configuration is used to distribute routes and signal dynamic tunnels. The dynamic-tunnels configuration creates IP-over-IP encapsulation-only tunnels in the Packet Forwarding Engine.</p> <p>The following are not supported:</p> <ul style="list-style-type: none"> <li>• Dynamic tunnel de-encapsulation operation</li> <li>• Next-hop-based statistics for dynamic tunnels</li> <li>• IP fragmentation at tunnel start point and path MTU discovery for IPv4/IPv6</li> </ul> <p>[See <a href="#">Next-Hop-Based Dynamic Tunneling Using IP-Over-IP Encapsulation</a> .]</p> <ul style="list-style-type: none"> <li>• Support for VRRP.</li> </ul> <p>The following features are not supported for VRRP on Junos OS Evolved:</p> <ul style="list-style-type: none"> <li>• ISSU</li> </ul>

**Table 1: Features Supported on the PTX10002-36QDD (Continued)**

Table 1: Features Supported on the PTX10002-36QDD (Continued)

Feature	Description
Interfaces	<ul style="list-style-type: none"> <li>• Interface support. The PTX10002-36QDD supports multiple port speeds and various channels under each port. The router supports a maximum port speed of 400 Gbps in low power mode. In standard power mode, it supports a port speed of 800 Gbps. If a port speed is configured (or a port speed is determined by default) without configuring number-of-sub-ports (at [edit interfaces <i>interface-name</i>] hierarchy level), the port operates in non-channelized mode.  [See <a href="#">Port Speed on PTX Routers</a>.]</li> <li>• 400G-ZR and 400G-ZR+ support enhancements. We support 400G-ZR and 400G-ZR+ optics enhancements on the PTX10002-36QDD. The enhancements include application selection and configuration of target output power. You can view the advertised applications and switch between the applications.  [See <a href="#">Features of 400ZR and 400G OpenZR+</a>.]</li> <li>• Support for performance monitoring and TCA. We support performance monitoring for the PTX10002-36QDD optical transceiver modules. The current and historical performance monitoring metrics are accumulated into 15-minute and 1-day interval bins. You can view the metrics using the show interfaces transport pm command and manage optical transport links efficiently.  [See <a href="#">show interfaces transport pm</a>.]</li> <li>• Support for timing and synchronization. The PTX10002-36QDD supports Synchronous Ethernet compliant with the following ITU recommendations: <ul style="list-style-type: none"> <li>• G.8262/G.8262.1—Specifies timing characteristics of Synchronous Ethernet equipment clock (EEC).</li> <li>• G.8264—Describes the Ethernet Synchronization Message Channel (ESMC).</li> </ul>  [See <a href="#">Synchronous Ethernet Overview</a>.]</li> </ul>

Table 1: Features Supported on the PTX10002-36QDD (Continued)

Feature	Description
	<ul style="list-style-type: none"> <li>• Support for load balancing under the [edit forwarding-options enhanced-hash-key] hierarchy.</li> </ul> <p>Load balancing includes:</p> <ul style="list-style-type: none"> <li>• GRE key inclusion for transit IPv4 and IPv6 traffic</li> <li>• IP Layer 3 fields</li> <li>• IP Layer 4 fields</li> <li>• IPv6 flow label inclusion</li> <li>• MPLS labels</li> <li>• MPLS port data</li> <li>• MPLS pseudowire traffic</li> <li>• Tunnel endpoint identifier (TEID) inclusion in GPRS tunneling protocol (GTP) packets</li> <li>• RSVP-TE load balancing in proportion to LSP bandwidth</li> </ul> <p>[See <a href="#">enhanced-hash-key</a>.]</p> <ul style="list-style-type: none"> <li>• Support for 128-way equal-cost multipath (ECMP) routing for MPLS transit cases.</li> </ul> <p>The following features do not support 128-way ECMP:</p> <ul style="list-style-type: none"> <li>• Multicast</li> <li>• P2MP</li> <li>• MC-LAG</li> <li>• Weighted unilist</li> <li>• Consistent hashing</li> <li>• Link protection (MPLS)</li> </ul>

Table 1: Features Supported on the PTX10002-36QDD (Continued)

Feature	Description
	<ul style="list-style-type: none"> <li>• Adaptive load balancing</li> <li>• Class-based forwarding</li> </ul> <ul style="list-style-type: none"> <li>• Support for 256-way ECMP. You can configure a maximum of 256 equal-cost multipath (ECMP) next hops for external BGP (EBGP) peers. This feature increases the number of direct BGP peer connections, which improves latency and optimizes data flow. However, we support 128 ECMP next hops for MPLS routes. Note that we do not support consistent load balancing (consistent hashing) for IPv4 or IPv6 with this feature.  [See <a href="#">Understanding BGP Multipath</a>.]</li> <li>• Support for FTI-based encapsulation and de-encapsulation of IPv4 and IPv6 packets. You can configure IP-IP encapsulation and de-encapsulation on flexible tunnel interfaces (FTIs). The default mode is loopback encap mode.  Use the <code>bypass-loopback</code> statement at the [edit interfaces fti number unit logical-unit-number tunnel encapsulation ipip] hierarchy level to change into flattened encap mode to achieve line-rate performance.  [See <a href="#">Tunnel and Encryption Services Interfaces User Guide for Routing Devices</a>.]</li> <li>• Support for configuring UDP tunnel encapsulation on FTIs. You can configure encapsulation by using the <code>tunnel encapsulation udp source address destination address</code> statements at the [edit interfaces fti unit unit] hierarchy level.  Keep in mind the following when configuring this feature: <ul style="list-style-type: none"> <li>• Adding <code>tunnel-termination</code> makes the tunnel a de-encapsulation-only tunnel and encapsulation is disabled.</li> <li>• Specifying both the source and destination address is mandatory when you do not configure <code>tunnel-termination</code>.</li> <li>• Configuring a variable prefix mask on the source address is not allowed.</li> </ul> </li> </ul>

Table 1: Features Supported on the PTX10002-36QDD (Continued)

Feature	Description
	<p>[See <a href="#">encapsulation (interfaces-fti)</a>.]</p> <ul style="list-style-type: none"> <li>• <b>GRE tunnel encapsulation using loopback-based interface.</b> You can configure GRE tunnel encapsulation on flexible tunnel interfaces (FTIs) using the loopback interface. Configure encapsulation by using the <code>tunnel encapsulation gre source <i>address</i> destination <i>address</i></code> statements at the <code>[edit interfaces <i>fti0</i> unit <i>unit</i> ]</code> hierarchy level.</li> </ul> <p>[See <a href="#">encapsulation (interfaces-fti)</a>.]</p> <ul style="list-style-type: none"> <li>• Support for GRE tunnel de-encapsulation using FTIs. Flexible tunnel interfaces (FTIs) support GRE tunnel de-encapsulation. When you enable the <code>tunnel-termination</code> statement at the <code>[edit interfaces <i>fti0</i> unit <i>unit-number</i>]</code> hierarchy level, tunnels are terminated on the WAN interface before any other actions—such as sampling, port mirroring, or filtering—are applied.</li> </ul> <p>[See <a href="#">Tunnel and Encryption Services Interfaces User Guide for Routing Devices</a>.]</p> <ul style="list-style-type: none"> <li>• Support for configuring MPLS protocols over FTI tunnels, thereby transporting MPLS packets over IP networks that do not support MPLS. Generic routing encapsulation (GRE) and UDP tunnels support the MPLS protocol for both IPv4 and IPv6 traffic. You can configure encapsulation and de-encapsulation for the GRE and UDP tunnels.</li> </ul> <p>To allow the MPLS traffic on the UDP tunnels, include the <code>mpls port-number</code> statement at the <code>[edit forwarding-options tunnels udp port-profile <i>profile-name</i>]</code> hierarchy level. To allow the MPLS traffic on the GRE tunnels, include the <code>mpls</code> statement at the <code>[edit interfaces <i>fti0</i> unit <i>unit</i> family]</code> hierarchy.</p> <p>[See <a href="#">Flexible Tunnel Interfaces Overview</a>.]</p>

## Chassis

- **Support for powering on, powering off, or restarting Packet Forwarding Engine (PTX10002-36QDD)**  
—Starting in Junos OS Evolved Release 23.4R2-S1, you can power off, power on, or restart the Packet Forwarding Engines in the router by following these steps:

1. Configure the *pair* of Packet Forwarding Engines that you want to restart or power off/on—for example:

- `set chassis fpc 0 pfe 0 power on`
- `set chassis fpc 0 pfe 1 power on`

**NOTE:** The four Packet Forwarding Engines are numbered 0–3. You configure them in pairs—0 and 1; 2 and 3.

2. Issue the power on, power off, or restart command—for example:

- `request chassis fpc slot 0 pfe 0 power on`

3. Enter **yes** when the following question appears on the screen:

- Warning: pfe 1 will also be offlined. Do you wish to continue?  
[yes,no]

**NOTE:** You can also set the `reset-pfe` action to reset a PFE when a chassis error occurs—configure the action statement at `[edit chassis fpc slot-number error error-severity-level]` hierarchy level.

[See [request chassis fpc](#) and [action \(chassis error\)](#). ]

- **Power redundancy and resiliency support (PTX10016)**—Starting in Junos OS Evolved Release 24.2R2, the PTX10016 with the JNP10K-PWR-AC3 power supply modules (PSMs) supports the following features:
  - N+1 power redundancy
  - Resiliency support for FRU components
  - PSM watchdog

You can enable either source redundancy or feed redundancy for the PSM.

[See [Managing Power](#), [watchdog \(PSM\)](#), and [Chassis-Level User Guide](#).]

## Class of Service

- **Policy map support (PTX10002-36QDD)**—Starting in Junos OS Evolved Release 23.4R2-S1, PTX10002-36QDD routers support policy maps, which enable you to assign rewrite rules on a per-customer basis. The policy map makes it possible to use any packet field to identify a given flow and specify a rewrite value for that flow. PTX10002-36QDD routers support the following types of packet marking: INET-Precedence, DSCP, IEEE802.1p, and IEEE802.1ad.

You can define a `policy-map` at the `[edit class-of-service]` hierarchy level. You enable `policy-map-marking` at the egress interface at the `[edit class-of-service interfaces interface-name unit unit-number]` hierarchy level.

[See [Assigning Rewrite Rules on a Per-Customer Basis Using Policy Maps Overview](#).]

## MACsec

- **MACsec bounded delay protection (PTX10002-36QDD)**—Starting in Junos OS Evolved Release 23.4R2-S1, you can enable Media Access Control Security (MACsec) bounded delay protection to protect your network against man-in-the-middle attacks. MACsec is an industry-standard security technology capable of identifying and preventing most security threats. During a man-in-the-middle

attack, an attacker intercepts packets and might redirect or modify them. This attack can cause an unexpected delay in how long a packet or frame takes to arrive at its intended destination.

When you enable MACsec bounded delay protection, the device guarantees that a frame will not be delivered after a delay of two seconds or more. MACsec periodically compares the number of frames transmitted to the number received. If a frame is sent but not received within two seconds, MACsec drops the packet. This ensures that a delay of MACsec frames resulting from a man-in-the-middle attack will not go undetected.

To enable bounded delay protection, configure the following options at the [edit security macsec connectivity-association *connectivity-association-name*] hierarchy level:

- mka bounded-delay
- replay-protect replay-window-size 0

[See [Configuring Bounded Delay Protection](#).]

## Precision Time Protocol (PTP)

- **Support for G.8275.1 profile, PTP over Ethernet encapsulation, and hybrid mode over LAG with PTP over Ethernet (PTX10002-36QDD)**—Starting in Junos OS Evolved Release 23.4R2-S1, these features are added to the router.

[See [G.8275.1 Telecom Profile](#), [Guidelines for Configuring PTP over Ethernet](#), and [Hybrid Mode](#).]

## Services Applications

- **Inline active flow monitoring IPFIX and version 9 template support for CoS policy-map name reporting in the ingress direction (PTX10002-36-QDD)**—Starting in Junos OS Evolved Release 23.4R2-S1, we support a new Juniper-specific enterprise Information Element ID, 32765, in the data record templates `ip4-template` and `ipv6-template`. This new IE ID is 4 bytes long and contains the first 4 characters of the policy-map name. Therefore, the first four letters of your policy-map names should be unique. You configure this new IE ID with the `include-policy-map-name` statement at the [edit services flow-monitoring (version-ipfix|version9) <template-name> data-record-fields] hierarchy level. You configure policy maps at the [edit class-of-service policy-map] hierarchy level.

[See [data-record-fields](#), [Understand Inline Active Flow Monitoring](#), and [Assigning Rewrite Rules on a Per-Customer Basis Using Policy Maps](#).]

## Software Installation and Upgrade

- **Zero touch provisioning on WAN interfaces (PTX10002-36QDD)**—Starting in Junos OS Evolved Release 23.4R2-S1, Zero Touch Provisioning (ZTP) dynamically detects the port speed of WAN interfaces and uses this information to create ZTP client ports with the same speed. ZTP automatically cycles through the WAN ports until it receives Dynamic Host Control Protocol (DHCP) options from the DHCP server. The device uses the DHCP options to perform the bootstrap process.

[See [Zero Touch Provisioning](#).]

## What's New in 23.4R2

### IN THIS SECTION

- [Additional Features](#) | 67

Learn about new features introduced in this release for PTX Series routers.

To view features supported on the PTX platforms, view the Feature Explorer using the following links. To see which features were added in Junos OS Evolved Release 23.4R2, click the Group by Release link. You can collapse and expand the list as needed.

- [PTX10001-36MR](#)
- [PTX10003](#)
- [PTX10004](#)
- [PTX10008](#)
- [PTX10016](#)

### Additional Features

We've extended support for the following features to these platforms.

- **Support for using VNI match condition on egress interfaces** (PTX10001-36MR, PTX10004, PTX10008, and PTX10016)

[See [Firewall Filter Match Conditions and Actions \(PTX Series Routers\)](#).]

Learn about what changed in this release for PTX Series routers.

## General Routing

- On PTX10004, PTX10008, and PTX10016 routers, after executing the `request node offline` command, you must wait at least 180 seconds to execute the `request chassis cb offline` command.
- **Enhanced DDoS statistics operational command (PTX Series)**—We've enhanced the aggregate DDoS statistics output field to display the aggregate statistics for BFD and DHCP protocols. The enhanced DHCP statistics output displays the collective DHCPv4 and DHCPv6 statistics for DDoS. Earlier to this release, the aggregate DDoS statistics output displayed 0 for aggregate BFD and the aggregate DHCPv4v6.

[See [show ddos-protection protocols](#).]

- Disable power redundancy alarms for JNP10K-PWR-DC2 PSM (PTX10008 and PTX10016)- The JNP10K-PWR-DC2 PSM supports power redundancy across two DIP switches. When all input feeds are not connected to power supplies, it triggers a chassis alarm such as `PSM 5 Input B0 and B1 Failed`. Starting in Junos OS Evolved Release 24.2R1, you can disable this chassis alarm by using the `set chassis alarm psm psm number input input number ignore` command.

[See [JNP10K-PWR-DC2 Power Supply](#).]

- **DDoS protection protocols statistics update (PTX Series)**—Starting in Junos OS Evolved Release 23.2R2, the `show ddos-protection protocols statistics` displays the `Max arrival rate` and `Arrival rate` output

values as expected. Earlier to this release, the `Max arrival rate` and `Arrival rate` output values were displayed larger than expected.

[See [show ddos-protection protocols parameters](#).]

## EVPN

- **Updates to syslog EVPN\_DUPLICATE\_MAC messages**—EVPN\_DUPLICATE\_MAC messages in the System log (syslog) now contain additional information to help identify the location of a duplicate MAC address in an EVPN network. These messages will include the following in addition to the duplicate MAC address:
  - The peer device, if the duplicate MAC address is from a remote VXLAN tunnel endpoint (VTEP).
  - The VLAN or virtual network identifier (VNI) value.
  - The source interface name for the corresponding local interface or multihoming Ethernet segment identifier (ESI).

For example: Feb 27 22:55:13 DEVICE\_VTEP1\_RE rpd 39839: EVPN\_DUPLICATE\_MAC: MAC address move detected for 00:01:02:03:04:03 within instance=evpn-vxlan on VNI=100 from 10.255.1.4 to ge-0/0/1.0.

For more on supported syslog messages, see [System Log Explorer](#).

## Infrastructure

- **Option to disable path MTU discovery**—Path MTU discovery is enabled by default. To disable it for IPv4 traffic, you can configure the `no-path-mtu-discovery` statement at the `edit system internet-options` hierarchy level. To reenale it, use the `path-mtu-discovery` statement.

[See [Path MTU Discovery](#).]

## Junos OS API and Scripting

- **<get-trace> RPC support removed (ACX Series, PTX Series, and QFX Series)**—The `show trace application app-name` operational command and equivalent `<get-trace> RPC` both emit raw trace data. Because the `<get-trace> RPC` does not emit XML data, we've removed support for the `<get-trace> RPC` for XML clients.

## System Management

- **Additional Upgrade fields for the `show system applications detail` command (ACX Series, PTX Series, and QFX Series)**—The `show system applications detail` command and corresponding RPC include additional Upgrade output fields. The fields provide information about notifications and actions related to various upgrade activities.

[See [show system applications \(Junos OS Evolved\)](#).]

## VPNs

- **Increase in revert-delay timer range**— The revert-delay timer range is increased to 600 seconds from 20 seconds.

[See [min-rate](#).]

- **Configure min-rate for IPMSI traffic explicitly**— In a source-based MoFRR scenario, you can set a min-rate threshold for IPMSI traffic explicitly by configuring `ipmsi-min-rate` under `set routing-instances protocols mvpn hot-root-standby min-rate`. If not configured, the existing min-rate will be applicable to both IPMSI and SPMSI traffic.

[See [min-rate](#).]

## Known Limitations

### IN THIS SECTION

## General Routing

- Below is the expected performance for this 21.4. Profile Freq (Hz) NoiseTransfer\_0\_00391\_Results PASS PASS NoiseTransfer\_0\_00781\_Results FAIL FAIL NoiseTransfer\_0\_01563\_Results FAIL FAIL NoiseTransfer\_0\_03125\_Results FAIL FAIL NoiseTransfer\_0\_06156\_Results FAIL FAIL NoiseTransfer\_0\_12313\_Results FAIL FAIL NoiseTransfer\_0\_24625\_Results PASS PASS NoiseTransfer\_0\_4925\_Results PASS PASS NoiseTransfer\_0\_985\_Results PASS PASS NoiseTransfer\_1\_985\_Results PASS PASS NoiseTransfer\_3\_985\_Results PASS PASS NoiseTransfer\_7\_985\_Results PASS PASS [PR1624502](#)
- On PTX10000 platforms, fault state is latched on PSM although all input and output is OK with no chassis alarm. [PR1669323](#)
- In high scaled (beyond 14000 s,g routes - 7000 ipv4 and 7000 ipv6 )NGMVPN SPMSI scenarios, core might be seen on PTX10003 platforms due to memory getting exhausted. [PR1708454](#)
- On all Junos OS Evolved platforms, VMcores are seen when MACsec (Media Access Control Security) key-chains and BGP(Border Gateway Protocol) configurations are applied through Netconf. [PR1732611](#)
- When class-of-service with shaping rate is configured on Aggregate Ethernet interfaces, and the firewall policer queries the aggregate Ethernet member and not the AE interface, the shaping rate or the policy configuration does not take effect as the shaping rate is not configured in AE member. [PR1735087](#)
- The na-grpcd might crash if there are OCST, IPAFT, cliNoise, snmp polling going on in the background. It will restart automatically and should be running fine afterwards.[PR1744033](#)
- On all Junos OS Evolved based PTX platforms with physical interface/LAG (Link Aggregation Group) interface in Layer 3 mode, the untagged control traffic on Layer 3 interface gets dropped if lport value of Layer 3 interface matches with lport value of Layer 2 aggregated ethernet (AE) interface in trunk mode. [PR1745528](#)
- Both SIB PWR/STAT H/W LEDs become Unlit/OFF by Routing Engine switchover on PTX10004, PTX10008, and PTX10016 Junos OS Evolved platforms. [PR1749781](#)
- This is a day-1 issue and currently in Junos OS Evolved on PTX10008 the fan FRU is not showing in the SNMP queries. In Junos OS Evolved only FT and FTC is shown - This is in comparison MX which also show as FAN also and its status in SNMP FRU. [PR1754833](#)
- On all Junos OS Evolved PTX platforms, RIB (Routing Information Base) and FIB (Forwarding Information Base) tables are not synchronized properly, causing the P2MP (Point-to-Multipoint) LSP (label-switched-path) traffic outage when executing the CLI command `clear rsvp session`.[PR1757635](#)

- On all Junos OS Evolved PTX10008, PTX10004, and PTX10016 platforms, when a Fan-tray is removed followed by an insertion, it will lead to fan-tray failures. [PR1767111](#)
- With DHCP trace options enabled in their regression scripts, this core was seen. Issue is random not seen always. This was enabled in script for debugging in production network this will not be enabled by default hence the issue will not be seen. Its recommended to enable DHCP trace options only for debugging not otherwise. [PR1771121](#)
- Transient parity error "pp\_0\_filter\_action\_0\_intr\_pmv\_eq\_zero" might seen, during filter modification with traffic running. [PR1778622](#)
- This FIB limitation is roughly 4 million routes is related to PTX systems: PTX10001-36MR PTX10000-LC1201-36CD Note: For exact scale and other details please open JTAC ticket or engage Juniper account team. [PR1772732](#)
- Low hold timer BGP sessions might flap post NSR switchover at 8000 BGP sessions scale in 23.4 release. [PR1781414](#)
- On Junos OS Evolved platforms, when configuration of Decap filter action is on egress, commit error on both RE/PFE syslog messages is seen, however there is no service impact due to this issue. [PR1793356](#)
- In case of primary-only inet6 address uses for re[01]:mgmt-0 interfaces, if there is inet6 address modification, the legacy inet6 address might still reside when do "ip -6 add show dev vmb0" under OS shell. The output of CLI command show interfaces re[01]:mgmt-0 shows the inet6 address correctly. [PR1796934](#)
- On all Junos OS Evolved platforms, time-zone info changes to default UTC after upgrade is done with restart-upgrade. [PR1803511](#)
- On all Junos OS Evolved platforms, while executing show log messages", error message **sysctl kern.corefile not supported** is seen which is introduced during daemon initialisation. [PR1808481](#)
- On Junos OS Evolved platforms, when license gets expired, LICENSE\_EXPIRED syslog is supposed to get generated which is missing. [PR1808956](#)
- [evpn\_vxlan] [evpn\_instance] ptx10001-36mr :: JDI-RCT: Error message observed "RT : Mac Route install failed for rtt table index:452 Mac:0x5e000004 BD:170 ifl:4294967295 error:Generic failure" after performing disable ae member link on TOR device. [PR1810348](#)
- On Junos OS Evolved PTX platform, the Border Gateway Protocol (BGP) session flap can be seen when inline Bidirectional Forwarding Detection (BFD) is configured under routing instance without loopback interface (lo0) leading to partial traffic drop. The issue is only seen when the interface is within the routing-instance. [PR1811245](#)

- VRRP (Virtual Router Redundancy Protocol) will not work when VRRP group 0 is configured and specific Junos OS Evolved platforms PTX10001, PTX10003, PTX10004, PTX10008, and PTX10016 are working as primary. [PR1816310](#)
- Segmentation fault on grpc timer thread (might be related to keepalive) #32085 grpc issue <https://github.com/grpc/grpc/issues/32085> grpc stack needs to be upgraded to 1.53 or later. [PR1722414](#)
- In Junos Evolved OS, during scaled configuration commit, Configd daemon in UI-infra is taking more time to process the commit. To optimise the processing time, most likely there will be design change required. There is no LKWR/pass instance. Also based on the configuration scale and the time taken for the commit to complete, it seems that this is a Day-1 issue. [PR1701214](#)
- JNP10K-PWR-AC3: There is a mismatch of the physical LED and shown in the SNMP LED status in case of d2d failure. [PR1831436](#)
- JNP10K-PWR-AC3: There is a mismatch of the physical LED and shown in the SNMP LED status in case of health check failure. [PR1831444](#)

## Flow-based and Packet-based Processing

- A router running sampling might see the msvcs-db daemon run at 99.9% for an extended period. [PR1816542](#)

## Infrastructure

- The request `routing-engine login other-routing-engine` command might fail. [PR1712705](#)

## Interfaces and Chassis

- On Junos OS Evolved PTX10000 platforms, the vmcore might be seen if any component is forcefully removed from the PCI (Peripheral Component Interconnect) bus. [PR1739142](#)

## MPLS

- On all Junos OS Evolved platforms, when MPLS (Multiprotocol Label Switching) statistics is configured without LSP (Label-Switched Path) configuration, the rpd process will crash and impact the routing protocols. This leads to traffic disruption due to the loss of routing information. [PR1698889](#)
- On all Junos OS Evolved platforms, a memory leak is observed in the traffic engineering database (TED) when the inet table is not cleaned up after routing instance deactivation. [PR1701800](#)

## Multicast

- On vPTX platforms, the PFE (packet forwarding engine) receives an invalid token from RPD (Routing Engine daemon) for composites next-hops due to which the PFE will crash leading to traffic drop. [PR1740390](#)

## Network Management and Monitoring

- EVO:JDI\_EVO\_REGRESSION:PLATFORM[ephemeral]:mgd core @ db\_oneliner\_perhaps. [PR1753241](#)
- On Junos OS Evolved platforms, SNMP cold start trap is observed on console log upon system reboot, but it is not sent out to external server. [PR1788308](#)

## Routing Policy and Firewall Filters

- On all Junos OS Evolved PTX platforms, the fwstatsd process will crash when openconfig-NI filter last term is only routing-instance action with no IPv4/IPv6 match. The process crash will impact show commands and openconfig state sensor support. [PR1788695](#)

## Routing Protocols

- ISIS TLV holds a maximum of 255 bytes of information per TLV. TLV contains data that has more than 255 bytes, current RFCs and drafts don't specify how to deal with multiple TLVs of same prefix. Hence it is advisable to associate bier subdomain to different lo0 TLV size exceed more than 255

bytes. It is not possible to define how many Bier subdomain will fit for given lo0 since it depend on other applicable subtlv associated with prefix. It is recommended to have advance planning/ calculation before putting multiple bier subdomains under a single lo0 address. IS-IS TLV size exceeds 255 bytes, router behavior is undefine and may lead to multiple network issues. [PR1776786](#)

## User Interface and Configuration

- If its a scaled configuration with some configuration groups containing both wildcard and non-wildcard configuration, then the time it takes to commit the configuration is high. If upgrade is performed with this scaled configuration, then initial commit after upgrade might timeout and lead to a corrupt databases which could lead to mustd crash. To avoid this problem, move the wildcard configuration to another group. [PR1804515](#)
- Netconf: File copy with password less authentication is failing with RPC request. [PR1769911](#)

## General Routing

- Junos OS Evolved: A high rate of SSH connections causes a Denial of Service (CVE-2024-39562). [PR1741624](#)
- The legacy inet6 address seen under vmb0 while modifying mgmt-0 IPv6 address with dadfailed. [PR1796934](#)
- Interfaces take a long time to come up after reboot when configured in scaled IFL environment. [PR1809423](#)
- [timing] [ptp] PTX10008 PTP-PTP & PTP-1pps : Few frequencies shall be failing to meet the mask. [PR1624478](#)
- DNS resolution over a routing-instance fails. [PR1733616](#)
- PTX10001-36mr: no debug logs created post boot of the DUT. [PR1746103](#)
- FPC unreachable due to running out of Guid space. [PR1756452](#)
- All FPC Mezz board status shows "unknown" on Junos OS Evolved PTX10004, PTX10008, and PTX10016. [PR1758265](#)
- Interface queue statistics are not displayed on show interfaces queue CLI command. [PR1760134](#)
- The license-check can get restarted. [PR1760259](#)
- Unknown sensors are added in PFE on all Junos OS Evolved platforms. [PR1765107](#)
- Traffic blackholed due to hardware errors like FPC/SIB power fail or fabric Link errors. [PR1766674](#)
- The xinted generates syslog messages "service ssh, accept: Invalid argument (errno = 22)" with high CPU usage. [PR1767072](#)
- FPCs experiences crash and restart whenever the network encounters either an MPLS LSP flap or a LAG flap. [PR1767747](#)
- All Junos OS Evolved platforms - ifmon process 100% utilization. [PR1768113](#)
- PCS errors on Ethernet interface on certain PTX platforms running Junos OS Evolved. [PR1768453](#)
- FPC offline causes PTX10003-160C to reboot. [PR1768610](#)
- L2TPV3 load-balancing not working properly and create out of order packet flow. [PR1769545](#)
- The **evo-aftmand-bt[15138]: [t:15257] [Error] Jexpr: Invalid pfeld** error logs seen on all Junos OS Evolved platforms. [PR1770432](#)

- MPLS traffic flow might not be as expected after PFE restart. [PR1770859](#)
- The hwdre application restart will lead to non-functioning of GNMIC and memory components. [PR1771597](#)
- The `show interfaces extensive | no-more` command is taking a longer time to display the output. [PR1773428](#)
- [Junos OS Evolved] PTX10001-36MR/PTX10004/8/16 BT - Tail-dropped packets count is getting incremented on strict-high queue which is not expected. [PR1773709](#)
- The Control Board and FPC will restart if the optics present in the first three ports of PTX10001-36MR draw 50W or more power. [PR1775320](#)
- Duplicate IPv4 address detection error not logged on syslog for Junos OS Evolved platforms. [PR1775981](#)
- Interface stay in link DOWN state when using third party optics. [PR1776596](#)
- The orchestrator core dump during JSU. [PR1776669](#)
- The `evo-aftmand-bt` process crash is observed during an RE switchover. [PR1776828](#)
- Functionality provided by `arp/ndp publish` argument does not work on all Junos OS Evolved platforms. [PR1776871](#)
- PTX10001-36MR: `epp_epc_intr_shmem_err` seen in logs. [PR1777003](#)
- PTX10004, PTX10008, and PTX100016 Junos OS Evolved - after GRES, the backup RE BITS left over alarms is still in CM alarms. [PR1777209](#)
- LAG interfaces will take longer than usual to come up in a scaled scenario with ALB [PR1777759](#)
- [EVO] Log message for DDoS violation information shows default time and date wrong when its violation state is cleared by "`clear ddos-protection protocols states`". [PR1778668](#)
- The SRV6 traceroute with more than 3 SIDs does not work. [PR1778946](#)
- [Junos OS Evolved] Committed configuration files are not preserved post software version rollback operation. [PR1779593](#)
- CLI configuration statement to enable or disable auto recovery of I2-learning module in EVO platforms [PR1779797](#)
- Ungraceful FPC removal from chassis causing "hwdre" crash and process stops leading to FPC in fault state. [PR1781493](#)
- The rewrite-rule configured for the forwarding-class are not working as expected. [PR1782536](#)

- License key is not installed after USB upgrade, through set system license keys key. [PR1783509](#)
- Higher AE traffic convergence observed in ALB configured AE interface. [PR1784498](#)
- Performing back to back SIB offline results in context deadline exceeded error on PTX10016. [PR1784766](#)
- IFBD lookup Failure in DLU, packets needs to be dropped rather than learned through control IFL in packetio. [PR1785084](#)
- Difference in TOD between EEC and PTP FPGA. [PR1787869](#)
- PTX10000 Junos OS Evolved platforms with high multicast route changes can trigger multicast traffic queue drops. [PR1789679](#)
- The pfstatsd process might fail to restart when running out of file descriptors. [PR1790095](#)
- Junos OS Evolved : Fails to display SNMP object values on channelized interface. [PR1790394](#)
- Port-mirroring issue observed when adding/deleting interface with port-mirror configuration. [PR1796517](#)
- Interface input drops and PFE statistics info cell drops shows an incorrect large value with any configuration leading to IFD bounce. [PR1796895](#)
- PTX10001-36MR enters booting loop when a system reboot or software upgrade initiated reboot is performed. [PR1799275](#)
- MPLS payload traffic coming over EVPN-MPLS tunnel is dropped on PTX Junos OS Evolved platforms. [PR1799760](#)
- PTX Junos OS DDoS stats values of "arrival rate" and "max arrival rate" on System-wide and FPC showing larger values than expected. [PR1801290](#)
- Minor Host 0 Voltage Threshold Crossed reported on PTX10001 systems. [PR1801330](#)
- [Junos OS Evolved] "Host 0 Disk 1 Labelled incorrectly" alarm is sometimes set and cleared in 5 seconds. [PR1801436](#)
- IRB interface output filters will not work. [PR1801716](#)
- LACP goes down after adding native-vlan-id on AE with MACsec enabled on child links. [PR1802071](#)
- FFT shared bandwidth policer update not working (Day-1 issue). [PR1812144](#)
- Observed **MCNHMBB index availability** alarm when system is subjected to heavy PIM join/prune churn. [PR1792740](#)

## Class of Service (CoS)

- Deletion of classifier/rewrite with import statement, along with some extra rules leads to the cosd process crash. [PR1787101](#)

## EVPN

- In the EVPN-MPLS scenario traffic between CE devices will drop. [PR1786959](#)

## Infrastructure

- Tunnel interface configuration crossing routing instances can cause fibd to abort. [PR1788995](#)

## Interfaces and Chassis

- Traffic loss will be observed when an invalid IPv6 link-local address is configured. [PR1774767](#)
- On PTX10003 4x10GE/4x25GE interface drop the traffic in working lanes when new lane is configured with 400GE as neighbor interface. [PR1810718](#)

## Network Management and Monitoring

- Junos OS Evolved, observing periodic error message "CMDOUT (error: error renaming temp state file /var/lib/logrotate.status.tmp)." [PR1747722](#)
- The Ifmd fails to send notification about CRC error is seen on link. [PR1769373](#)
- CFM OAM status is **MEP status: Platform Unsupported** state in PTX10004 with LC1201 linecard. [PR1777354](#)
- The mib2d crash is observed on Junos OS Evolved platforms with duplicate SNMP request. [PR1815524](#)

## Routing Policy and Firewall Filters

- [PTX10004 EVO] Maximum configurable value of policer if-exceeding "bandwidth-limit" is 100Gbps. [PR1798975](#)
- [Junos OS Evolved] - Firewall policer limits are adjusted on PTX10001-36MR to match the limits in other PTX10000 platforms. [PR1800423](#)
- [Junos OS Evolved] - Firewall policer limits are adjusted on PTX10003 to match the limits in other PTX10000 platforms. [PR1804725](#)

## Junos OS Evolved Release Notes for QFX Series

These release notes accompany Junos OS Evolved Release 23.4R2 for QFX5130-32CD, QFX5130-48C, QFX5130E-32CD, QFX5220, QFX5230-64CD, QFX5240, QFX5700, QFX5700E-FEB switches. They describe new and changed features, limitations, and known and resolved problems in the hardware and software.

## What's New in 23.4R2-S1

### IN THIS SECTION

- [Hardware | 82](#)

Learn about new features introduced in this release for QFX Series routers.

### Hardware

- **New QFX5130-48CM switch (QFX Series)**—In Junos OS Evolved Release 23.4R2-S1, we introduce the new Juniper Networks® QFX5130-48CM Switch. We also support this release on the QFX5130-48C switch. QFX5130-48CM is our first 1-U fixed form factor switch that is completely optimized for 100-Gigabit Ethernet (GbE) server connections. The QFX5130-48CM switch offers high-density 100GbE access ports in an SFP-DD form factor optimized for servers, along with high-density 400GbE ports in a QSFP-56 form factor optimized for easy uplinks to data centers. The QFX5130-48CM switch provides a throughput of 8 terabit per second (Tbps) by means of:
  - Forty-eight high-density 100GbE access ports that support SFP-DD transceivers optimized for servers.
  - Eight high-density 400GbE ports that support QSFP56 transceivers optimized for easy uplinks to the spine layer in data centers.
  - Support for Media Access Control Security (MACsec) feature.

The QFX5130-48CM runs Junos OS Evolved. We've designed it to meet the needs of demanding data center environments such as high-performance computing and research networks and cloud and service provider data centers.

Table 2: QFX5130-48CM and QFX5130-48C Feature Support

Feature	Description
CoS	<ul style="list-style-type: none"> <li>• CoS support on EVPN VXLANs. [See <a href="#">CoS Support on EVPN VXLANs.</a>]</li> <li>• Support for priority-based flow control (PFC) of untagged traffic at Layer 3 using Differentiated Services Code Points (DSCP). [See <a href="#">Understanding PFC Using DSCP at Layer 3 for Untagged Traffic.</a>]</li> </ul>
Ethernet switching and bridging	<ul style="list-style-type: none"> <li>• Support for Q-in-Q tunneling with a Service Provider Style configuration. [See <a href="#">Configuring Q-in-Q Tunneling.</a>]</li> <li>• LLDP support. [See <a href="#">Device Discovery Using LLDP.</a>]</li> <li>• Support for MAC move limit with EVPN-VXLAN. [See <a href="#">Understanding MAC Move Limiting.</a>]</li> </ul>
Forwarding options	<ul style="list-style-type: none"> <li>• Support for port mirroring in EVPN-VXLAN environments. [See <a href="#">How to Configure Remote Port Mirroring for EVPN-VXLAN Fabrics.</a>]</li> </ul>
High availability	<ul style="list-style-type: none"> <li>• Support for VRRP on Packet Forwarding Engine. [See <a href="#">VRRP Overview.</a>]</li> </ul>

Table 2: QFX5130-48CM and QFX5130-48C Feature Support (*Continued*)

Feature	Description
Interfaces	<ul style="list-style-type: none"> <li>• Support for BGP flow specification (flowspec). [See <a href="#">BGP</a>.]</li> <li>• Support for 48 SFP-DD and 8 QSFP-DD ports. Each switch also supports two 10-Gbps SFP+ ports. We support the following port configurations on each switch: <ul style="list-style-type: none"> <li>• 48x100-Gbps / 50-Gbps / 25-Gbps / 10-Gbps on SFP-DD ports</li> <li>• 8x400-Gbps / 200-Gbps / 100-Gbps / 40-Gbps on QSFP-DD ports</li> <li>• 2x10-Gbps on SFP+ ports</li> </ul> [See <a href="#">Port Settings (Interface Guide for Switches)</a>.] </li> <li>• Support for MACsec on physical interfaces –This platform supports MACsec in dynamic CAK mode with GCM-AES-128, GCM-AES-256, GCM-AES-XPN-128, and GCM-AES-XPN-256 encryption. This feature is supported on physical interfaces for switch-to-host and switch-to-switch links.  [See <a href="#">Configuring MACsec</a>.]</li> </ul>
Junos telemetry interface (JTI)	<ul style="list-style-type: none"> <li>• JTI streaming support for hardware Routing Engine-based sensors. Subscribe to /components/sensor to stream hardware operational stages. Statistics include Routing Engine, power supply unit (PSU), Control Board, Flexible PIC Concentrator (FPC), and PIC states.  [See <a href="#">Junos YANG Data Model Explorer</a>.]</li> </ul>

Learn about new features introduced in this release for the QFX Series switches.

## Hardware

- New QFX5130-48C switch (QFX Series)**—Starting in Junos OS Evolved Release 23.4R2, we introduce the Juniper Networks® QFX5130-48C Switch. QFX5130-48C is our first 1-U fixed form factor switch that is completely optimized for 100GbE server connections. The QFX5130-48C switch offers high-density 100GbE access ports in a SFP-DD form factor optimized for servers, along with high-density 400GbE ports in a QSFP-56 form factor optimized for easy uplinks to data centers. The QFX5130-48C provides a throughput of 8 Tbps by means of:
  - Forty-eight high-density 100GbE access ports that support SFP-DD transceivers optimized for servers.
  - Eight high-density 400GbE ports that support QSFP56 transceivers optimized for easy uplinks to the spine layer in data centers.

The QFX5130-48C runs Junos OS Evolved. We've designed it to meet the needs of demanding data center environments such as high-performance computing and research networks and cloud and service provider data centers.

**Table 3: QFX5130-48C Feature Support**

Feature	Description
Class of service	CoS support on EVPN-VXLAN. [See <a href="#">CoS Support on EVPN VXLANs.</a> ]

Table 3: QFX5130-48C Feature Support (*Continued*)

Feature	Description
Ethernet switching and bridging	<ul style="list-style-type: none"> <li>• Support for Q-in-Q tunneling with a service-provider-style configuration. [See <a href="#">Configuring Q-in-Q Tunneling</a>.]</li> <li>• LLDP support. [See <a href="#">Device Discovery Using LLDP</a>.]</li> <li>• Support for MAC move limit with EVPN-VXLAN. [See <a href="#">Understanding MAC Move Limiting</a>.]</li> </ul>
Forwarding options	<ul style="list-style-type: none"> <li>• Support for port mirroring in EVPN-VXLAN environments. [See <a href="#">How to Configure Remote Port Mirroring for EVPN-VXLAN Fabrics</a>.]</li> </ul>
High availability	<ul style="list-style-type: none"> <li>• VRRP support on Packet Forwarding Engine. [See <a href="#">VRRP Overview</a>.]</li> </ul>
Interfaces	<ul style="list-style-type: none"> <li>• Support for BGP flowspec. [See <a href="#">BGP</a>.]</li> </ul>
Junos Telemetry Interface (JTI)	<ul style="list-style-type: none"> <li>• JTI streaming support for hardware Routing Engine-based sensors. Subscribe to the / components/sensor to stream hardware operational stages. Statistics include Routing Engine, power supply units (PSUs), Control Boards, FPCs, and PICs states. [See <a href="#">Junos YANG Data Model Explorer</a>.]</li> </ul>

- New QFX5230-64CD switch (QFX Series)**—Starting in Junos OS Evolved Release 23.4R2, QFX5230-64CD offers high-density 400-Gigabit Ethernet (GbE) access ports in a QSFP-DD form factor optimized for high-end spine and super-spine layer of the IP fabric multitier architecture in a 2-RU fixed form factor. The QFX5230-64CD switch provides a unidirectional throughput of 25.6 terabit per second (Tbps) and offers 64 400GbE network ports and up to 128x200GbE, 256x100GbE, 64x40GbE, 256x25GbE, and 258x10GbE ports.

Table 4: QFX5230-64CD Feature Support

Feature	Description
Chassis	<ul style="list-style-type: none"> <li>• Support for inbuilt Routing Engine, Control Board, power supply unit, fan trays, Flexible PIC Concentrators (FPCs), and PICs on the QFX5230-64CD switch.</li> <li>• We have extended the Junos environment monitoring (EM) policy to include optics temperature sensors for QFX5230-64CD switches. It includes the following features: <ul style="list-style-type: none"> <li>• The optics EM policy incorporates periodically polled temperature readings of optical modules in the system to automatically manage the fan speed.</li> <li>• 100GbE and 400GbE optics firmware automatically triggers optics shutdown when the high-temperature threshold is breached.</li> <li>• EM policy is enabled by default on all 100GbE and 400GbE optics interfaces, except for loopback optics and direct attach copper (DAC) cables.</li> </ul> </li> </ul> <p>You can use the <code>set chassis fpc fpc_slot pic pic_slot port port_no no-temperature-monitoring</code> command to explicitly disable the EM policy on specific WAN ports. Use the <code>show chassis environment</code> command to view the optics temperature.</p> <p>[See <a href="#">temperature-sensor.</a>]</p>

Support for optics	<ul style="list-style-type: none"> <li>• Select your product in the <a href="#">Hardware Compatibility Tool</a> to view supported transceivers, optical interfaces, and DAC cables for your platform or interface module. We update the HCT and provide the first supported release information when the optic becomes available.</li> </ul>

- New QFX5130E-32CD and QFX5700E-FEB models (QFX Series)—

Starting in Junos Evolved OS Release 23.4R2, we introduce the QFX5130E-32CD and QFX5700E-FEB derivatives that are based on our QFX5130 and QFX5700 products. Both these new derivatives are based on the Trident 4-X11E platform.

## Chassis

- **Platform software resiliency support (QFX5130-48C)**—Starting in Junos OS Evolved Release 23.4R2, platform software resiliency support is provided for QFX5130-48C, that includes:
  - CPU
  - Field replaceable units (FRUs)
  - Memory
  - USB port
  - Management Ethernet ports
  - Field-programmable gate array (FPGA) board
  - Optics panel
  - Fan tray
  - Power supply module

If a failure is detected on a hardware component, the Junos OS Evolved software:

- Logs the message with failure details, including time stamp, module name, and component name.
- Raises or clears alarms, if applicable.
- Makes the LED glow to indicate FRU fault.
- Performs local action, such as self-healing and taking the component out of service.

[See [QFX5130 Switch Hardware Guide](#) and [Chassis-Level User Guide](#). ]

- **Platform Software support for Routing Engine RE-QFX5130-48C (QFX5130-48C)**— Starting in Junos OS Evolved Release 23.4R2, platform software support is provided for Routing Engine RE-QFX5130-48C on QFX5130-48C. [See [Chassis-Level User Guide](#). ]
- **Port speed support (QFX5130E-32CD)**—Starting in Junos OS Evolved Release 23.4R2, you can configure 10-Gbps, 25-Gbps, 40-Gbps, or 100-Gbps port speed on QFX5130E-32CD switches.

[See [speed](#).]

- **Chassis management for FEB QFX5700E-FEB (QFX5700)**— Starting in Junos OS Evolved Release 23.4R2, you can use the following commands to manage the new Forwarding Engine Board QFX5700E-FEB and view information about the FEB:

- `request chassis feb slot slot-number (offline | online | restart)` to offline, online, or restart the specified FEB
- `show chassis feb` and `show chassis environment feb` commands to display FEB status information

[See [request chassis feb](#), [show chassis feb](#), [show chassis environment](#)]

- **Optics EM policy support (QFX5230-64CD)**—Starting in Junos OS Evolved Release 23.4R2, we have extended the Junos Environment Monitoring (EM) policy to include optics temperature sensors for QFX5230-64CD switches. It includes the following features:

- The Optics EM policy incorporates periodically polled temperature readings of optical modules in the system to automatically manage the fan speed.
- 100GbE and 400GbE optics firmware automatically triggers optics shutdown when the high-temperature threshold is breached.
- EM policy is enabled by default on all 100GbE and 400GbE optics interfaces, except for loopback optics and direct attach copper (DAC) cables.

You can use the `set chassis fpc fpc_slot pic pic_slot port port_no no-temperature-monitoring` command to explicitly disable the EM policy on specific WAN ports. Use the `show chassis environment` command to view the optics temperature.

[ See [temperature-sensor](#).]

## Junos Telemetry Interface

- **Configure an IP source address and routing instance for legacy gRPC dial-out connections (QFX5230-64CD, QFX5240-64OD, and QFX5240-64QD)**—Junos OS Evolved Release 23.4R2 supports configuring a source IP address and routing instance for legacy Remote Procedure Call (gRPC) service dial-out connections. In prior releases supporting legacy gRPC dial-out, the outgoing interface IP address is used as the source address without an option to configure a source IP address. This feature supports FLEX deployments, providing the ability to send dial-out from the router's specified IP address or interface address (such as a loopback0 address).

Use the `routing-instance` statement at the `[edit services analytics export-profile profile-name]` hierarchy level and the `local-address ipv4 or ipv6 address` statement at the `[edit services analytics export-profile profile-name]` hierarchy level.

[See [Using gRPC Dial-Out for Secure Telemetry Collection](#), `routing-instance`, and `local-address`.]

- **Telemetry for IPv4 and IPv6 traffic statistics (QFX5230-64CD, QFX5240-64OD, and QFX5240-64QD)**—Starting from Junos OS Evolved Release 23.4R2, you can stream IPv4 and IPv6

transit statistics using the native resource path `/junos/system/linecard/interface/traffic` or the OpenConfig resource path `/interfaces/interface/`. You can export the following fields are exported:

- `if_in_ipv4pkts`
- `if_in_ipv4_1sec_pkts`
- `if_in_ipv4_bytes`
- `if_in_ipv4_1sec_octets`
- `if_out_ipv4pkts`
- `if_out_ipv4_1sec_pkts`
- `if_out_ipv4_bytes`
- `if_out_ipv4_1sec_octets`
- `if_in_ipv6pkts`
- `if_in_ipv6_1sec_pkts`
- `if_in_ipv6_bytes`
- `if_in_ipv6_1sec_octets`
- `if_out_ipv6pkts`
- `if_out_ipv6_1sec_pkts`
- `if_out_ipv6_bytes`
- `if_out_ipv6_1sec_octets`

To enable transit statistics for the physical port, you must configure route accounting. To enable IPv4 route accounting or IPv6 route accounting, include the `route-accounting` statement at the `[edit forwarding-options family family-name]` hierarchy level.

[For sensors, see [Junos YANG Data Model Explorer](#). For route accounting, see [route-accounting](#).]

- **Telemetry for IPv4 and IPv6 traffic statistics (QFX5130-48C)**—Starting from Junos OS Evolved Release 23.4R2, you can stream hardware Routing Engine-based sensors using Junos telemetry interface (JTI). Subscribe to the `/components/` sensor to stream hardware operational states for the Routing Engines, power supply units (PSUs), control boards, FPCs, and PICs.  
[For sensors, see [Junos YANG Data Model Explorer](#).
- **Telemetry support for CoS ingress packet drop accounting (QFX5230-64CD, QFX5240-64OD, and QFX5240-64QD)**—Junos OS Evolved Release 23.4R2 supports streaming counters for packets that are dropped due to ingress port congestion. Use the native sensor `/junos/system/linecard/`

**interface/traffic** to stream counters for priority-based flow control (PFC), explicit congestion notification (ECN), and ingress drops. Use the native sensor `/junos/system/linecard/qmon-sw/` to stream the priority group (PG) buffer utilization. You can stream counters for PFC, ECN, and ingress drops by means of OpenConfig using the sensor `/interfaces/interface/`.

[For sensors, see [Junos YANG Data Model Explorer](#).]

## Precision Time Protocol (PTP)

- **Transparent clock support (QFX Series)**—Starting in Junos OS Evolved Release 23.4R2, QFX5130E-32CD switches support the Precision Time Protocol (PTP) transparent clock feature.

[See [PTP Transparent Clock](#).]

- **Enterprise profile support (QFX Series)**—Starting in Junos OS Evolved Release 23.4R2, QFX5130E-32CD devices support the Precision Time Protocol (PTP) enterprise profile feature.

[See [PTP Enterprise Profile](#).]

## Platform and Infrastructure

- **NIST purge method for media sanitization (QFX5130-32CD, QFX5220, and QFX5230-64CD)**—Starting in Junos OS Evolved Release 23.4R2, we've extended support for NIST media sanitization for SATA hard disk drives to:
  - Cryptographic scramble and block erase priorities for the purge method
  - Enhanced secure erase priority for the clear method

For example, you can use this high level of data destruction when you pull a device from production. To maintain data security, you want to sanitize any disk drives in the device before it leaves your premises. The *NIST Special Publication 800-88* specifies the priority levels for sanitizing disk drives. In Junos OS Evolved, you sanitize a disk drive using the `request system zeroize (disk1 | disk2)` command. The sanitization process starts at the highest NIST sanitization priority that the disk drive supports. If that attempt fails, the process uses the method associated with the next lowest NIST priority level, and so on, until the disk is sanitized either using one of the NIST methods or using the Linux `dd` command.

[See [NIST Special Publication 800-88, Guidelines for Media Sanitization](#).]

## Routing Protocols

- **BGP link bandwidth community ( QFX5130-32CD, QFX5130E-32CD, QFX5130-48C, QFX5700, QFX5700E, QFX5220, QFX5230-64CD, QFX5240-64OD, QFX5240-64QD)**—Starting in Junos OS Evolved Release 23.4R2, BGP can communicate link speeds to remote peers, enabling better optimization of traffic distribution for load balancing. A BGP group can send the *link-bandwidth* non-transitive extended community over an EBGP session for originated or received and readvertised link-bandwidth extended communities.

To configure the non-transitive link bandwidth extended community, include the bandwidth-non-transitive: *value* in the export policy at the [edit policy-options community *name* members *community-ids*] hierarchy level.

To enable the device to automatically detect and attach the link-bandwidth community on a route at import, include the auto-sense statement at the [edit protocols bgp group link-bandwidth] hierarchy level. This feature facilitates the integration of devices with different transmission speeds within the network, enabling efficient traffic distribution based on link speed.

[See [auto-sense](#), and [group \(Protocols BGP\)](#).]

- **Minimum ECMP (QFX5130-32CD, QFX5130-48C, QFX5220, QFX5230-64CD, QFX5240-64OD, and QFX5240-64QD)**—Starting in Junos OS Evolved Release 23.4R2, we support conditional advertising and withdrawal of BGP routes based on certain constraints such as bandwidth and minimum available next-hop ECMP. When a BGP receiver learns the same route from multiple BGP peers, BGP updates the active BGP path and the routing information base (RIB), also known as the routing table. The BGP export policy determines whether to advertise the BGP route to these next hops based on the number of ECMP BGP peers it receives the prefix from. A BGP route that has multiple ECMP BGP peers creates better resiliency in case of link failures. You can configure a BGP export policy to withdraw a BGP route unless it receives the BGP route prefix from a minimum number of ECMP BGP peers.

## Services Applications

- **Protection against DDoS attacks (QFX5130-48C)**—Starting in Junos OS Evolved Release 23.4R2, you can configure and install policers at the Packet Forwarding Engine level for defense from DDoS attacks. DDoS protection is enabled by default on the QFX5130-48C switches.

[See [Control Plane Distributed Denial-of-Service \(DDoS\) Protection Overview](#) and [protocols \(DDoS\) \(ACX Series, PTX Series, and QFX Series\)](#).]

## Software Installation and Upgrade

- **Firmware upgrade support (QFX5130-48C)**—Starting in Junos OS Evolved Release 23.4R2, the QFX5130-48C switch supports the following firmware-upgrade commands:
  - request system firmware upgrade fpc slot 0 bcm-pfe
  - request system firmware upgrade fpc slot 0 dp11
  - request system firmware upgrade fpc slot 0 dp11-cfg
  - request system firmware upgrade fpc slot 0 opticscpld<0|1|2|3>
  - request system firmware upgrade psm slot <0|1>
  - request system firmware upgrade re bios

- `request system firmware upgrade re fancpld`
- `request system firmware upgrade re fpga`
- `request system firmware upgrade re i210`
- `request system firmware upgrade re ssd <disk1|disk2>`
- `request system firmware upgrade re xmcfga`

[See [request system firmware upgrade](#).]

- **Optimize reboot times by disabling default initialization and startup of certain L2 applications (QFX5130-32CD, QFX5130-48C, QFX5220, and QFX5700)**—Starting in Junos OS Evolved Release 23.4R2, when rebooting the device, the Layer 2 (L2) applications `l2ald`, `l2ald-agent`, `l2cpd`, and `l2cpd-agent` are initialized and started only if any of the following configuration hierarchy levels contain any configuration statements:

- [edit interface *interface-name* unit *number* family ethernet-switching]
- [edit vlans]
- [edit routing-instance *instance-name* instance-type virtual-switch]
- [edit routing-instance *instance-name* instance-type mac-vrf]
- [edit protocols l2-learning]

Additionally, `l2cpd`, and `l2cpd-agent` are initialized and started if the [edit protocols `lldp`] hierarchy level contains any configuration statements.

As a result of this change, if your configuration already contains these configuration statements and you then delete all of them, these L2 applications stop running.

[See [request node reboot \(re0 | re1\) \(Junos OS Evolved\)](#), [request system reboot \(Junos OS Evolved\)](#), and [request system software add \(Junos OS Evolved\)](#).]

## Additional Features Optimized for AI-ML Fabrics

For more information about features optimized for AI-ML fabrics, see the [AI-ML Data Center Feature Guide](#).

- **Reactive Path Rebalancing (QFX5240)**—Starting in 23.4R2 Junos OS Evolved Release, QFX5240 devices support Reactive Path Rebalancing. Reactive Path Rebalancing is an enhancement to the existing Flowlet mode in the Dynamic Load Balancing (DLB) feature. In the Flowlet mode of DLB, the user configures an inactivity interval. The traffic uses assigned outgoing interface until a pause in flow is greater than the inactivity timer. It is possible that the current outgoing link quality becomes worse over a period of time and the pause within the flow does not exceed the inactivity timer that

is configured. Classic Flowlet mode does not reassign to a different link within the inactivity interval and cannot utilize a better quality link. Reactive path rebalancing addresses this limitation by enabling the user to move the traffic to a link with a better quality in the Flowlet mode.

As per the existing DLB feature, each ECMP egress member link has a quality band assigned based on the traffic flowing through it. The quality band depends on the port load or number of egress bytes transmitted and queue buffer or the number of bytes waiting to be transmitted from the egress port. You can customize these attributes based on the traffic pattern flowing through the ECMP.

Benefits of the reactive path load balancing are:

- Optimal use of bandwidth
- Scalability
- Helps in avoiding load balancing inefficiencies due to long lived flows.

You need to configure DLB in the Flowlet mode. If you enable reactive path load balancing, packet reordering can occur when the flow moves from one port to another.

You need to satisfy the following rules to reassign a flow to a higher-quality member:

- An egress member port should be available whose quality is equal or greater than the current egress port.
- The packet random value is lower than the reassignment probability threshold value. When you configure a lower probability threshold value, flows move to higher-quality member at slower rate. For example, a probability threshold value of 200 has faster movement of macro flows to higher-quality member than probability threshold value of 50.

### Example

Consider topology as shown in [Figure 1 on page 130](#), where there are three ingress ports and two egress ports in a device. Also shown are table entries forwarding the traffic to each of the egress ports. All the ingress and egress ports are of the same speed.

**Figure 1: Reactive Path Rebalancing**

Reactive load rebalancing works with quality of delta 2 as follows:

1. Start stream 1 dmac 0x123 with rate 10 percent ingress port et-0/0/0 and egress out of et-0/0/10. Start stream 3 with rate of 50 percent ingress port et-0/0/1 and it egresses out of et-0/0/11.

Egress link utilization is et-0/0/10 is 10 percent with Quality Band 6 and et-0/0/11 is 50 percent with quality band 5.

2. Start stream 2 dmac 0x223 with rate of 40 percent ingress port et-0/0/2 and it egresses out of et-0/0/11.

The reactive load balancing algorithm kicks in if the difference in quality bands for ports et-0/0/10 and et-0/0/11 is equal or higher than the configured delta of 2. The algorithm moves the stream 3 from et-0/0/11 to a better-quality member link, which is et-0/0/10 in this case.

After some time, you see et-0/0/10 link utilization of 60 percent with quality band of 5 as it egresses stream 1 and stream 3. The et-0/0/11 link utilization is of 40 percent with quality band of 5 as it egresses stream 2. See [enhanced hash-key](#) and [show forwarding-options enhanced-hash-key](#).

- **Configurable FlowSet Table in DLB Flowlet Mode (QFX5000)**—DLB uses the FlowSet table to determine the egress interface of flows. The FlowSet table can hold a total of 32000 entries that needs to be distributed among 128 DLB ECMP groups. By default, these are divided equally allocating 256 entries per ECMP group. Starting in Junos 23.4R2 Junos OS Evolved Release, you can change the distribution of entries among the ECMP groups. If the FlowSet table has more ECMP group entries, the ECMP group can accommodate larger number of flows thereby achieving better flow distribution. See [Dynamic Load Balancing](#).
- **PFC watchdog support (QFX5230-64CD, QFX5240-64OD, QFX5240-64QD)** —Starting in Junos OS Evolved Release 23.4R2, QFX5230-64CD, QFX5240-64OD, and QFX5240-64QD switches support the PFC watchdog feature. The PFC watchdog monitors PFC-enabled ports for PFC pause storms. When a PFC-enabled port receives PFC pause frames for an extended period of time and PFC watchdog does not detect flow control frames on that port, PFC watchdog mitigates the situation. It does this by disabling the queue where the PFC pause storm was detected for a configurable length of time called the recovery time. After the recovery time passes, PFC watchdog re-enables the affected queue.

You configure PFC watchdog by including the `pfc-watchdog` statement at the `[class-of-service congestion-notification-profile profile-name]` hierarchy level. There are four parameters for PFC watchdog that you can configure for QFX5230-64CD, QFX5240-64OD, and QFX5240-64QD switches:

- `poll-interval`—The interval at which PFC watchdog checks the status of PFC queues, which can be 1, 10, or 100 milliseconds.
- `detection`—The number of polling intervals the PFC watchdog waits before it mitigates the stalled traffic, from 1-15 intervals.

- **watchdog-action**—The action the PFC watchdog takes to mitigate a stalled traffic queue, either drop or forward all enqueued and newly arriving packets.
- **recovery**—How long the PFC watchdog disables the affected queue before it restores PFC on the queue, from 100-1500 milliseconds with a default of 200 milliseconds.

[See [PFC Watchdog](#) and [congestion-notification-profile](#).]

- **Priority-based flow control X-ON Threshold support (QFX5230-64CD, QFX5240-64OD, and QFX5240-64QD)**—The priority-based flow control (PFC) X-ON threshold is the ingress port's priority group (PG) shared buffer limit. At this limit, the ingress port's peer resumes transmission of packets after a brief PAUSE because of the PFC message sent by this ingress port. You can fine tune the X-ON threshold through the congestion notification profile (CNP).

[See [xon \(Input Congestion Notification\)](#).]

- **Per-queue alpha support (QFX5230-64CD, QFX5240-64OD, and QFX5240-64QD)**—You can tune globally the limit of buffers that each queue can consume from the shared pool based on the dynamic threshold setting called the alpha value. You can fine tune the alpha value on a per-queue basis through a scheduler.

[See [buffer-dynamic-threshold](#).]

- **Support for increased shared buffer pool (QFX5230-64CD, QFX5240-64OD, and QFX5240-64QD)**—By default, the QFX5230 switch allocates 73MB of the total 113MB of global buffer space to shared buffers, and the QFX5240 switch allocates 82MB of the total 165MB of global buffer space to shared buffers. These switches allocate the remaining buffer space to dedicated buffers (ingress and egress). You can decrease the global dedicated buffer space from the default value, effectively increasing the global shared buffer space to up to 106MB on the QFX5230 and 147MB on the QFX5240.

You can also define a dedicated buffer profile to increase or decrease the dedicated buffer allocated to an individual port. This feature is particularly useful for decreasing dedicated buffer space on unused or down ports, thereby increasing dedicated buffer space available to active ports.

[See [Configuring Ingress and Egress Dedicated Buffers](#).]

- **egress-quantization (QFX5230-64CD, QFX5240-64OD, and QFX5240-64QD)**—Starting in Junos OS Evolved Release 23.4R2, you can modify port load and port queue metrics from their default values so that when dynamic load balancing is enabled, the metrics are used to determine an optimal link. Use the new egress-quantization CLI to configure the desired ratio of port load metric to port queue metric based on the traffic pattern.

[See [egress-quantization](#).]

- **rdma-opcode firewall filter match condition (QFX5230-64CD, QFX5240-64OD, and QFX5240-64QD)**—Starting in Junos OS Evolved Release 23.4R2, `rdma-opcode` and `rdma-opcode-except` firewall filter match conditions have been added to enable match on InfiniBand Base Transport header opcode.

[See [rdma-opcode](#).]

- **BGP Support for Global Load Balancing in DC Fabric (QFX5240)**—Starting in Junos OS Evolved Release 23.4R2, a route with multiple ECMP links is hashed onto several links for load balancing. In a DC fabric, hashing is unable to ensure even load distribution over all ECMP links, which might result in congestions on certain links and underutilization on other links. Dynamic load balancing helps to avoid congested links to mitigate local congestion. However, dynamic load balancing cannot address some congestions. For example, AI ML traffic that has elephant flows and lacks entropy causes congestions in the fabric. In this case, global load balancing (GLB) helps to mitigate these congestions.

In a CLOS network the congestions on the first two next hops impacts the load balancing decisions of the local node and the previous hop nodes triggering global load balancing. If the route has only one next-next-hop, a simple path quality profile is created. If the route has more than one next next-hop node then a simple path quality profile is created for each next next-hop node.

To enable global load balancing, include the `global-load-balancing` statement at the `[edit protocols bgp]` hierarchy level. We have disabled this statement by default.

- **Extended sFlow Functionality Support (QFX5230-64CD, QFX5240-64OD, and QFX5240-64QD)**—Starting in Junos OS Evolved Release 23.4R2, we've extended the sflow monitoring functionality to support the following features:

- Export of sFlow sample packets via `mgmt_junos` interface.

By default, the management Ethernet interface (usually named `fxp0` or `em0` for Junos OS, or `re0:mgmt-*` or `re1:mgmt-*` for Junos OS Evolved) provides the out-of-band management network for the device. Out-of-band management traffic is not clearly separated from in-band protocol control traffic. Instead, all traffic passes through the default routing instance and shares the default `inet.0` routing table.

Once you deploy the `mgmt_junos` VRF instance, management traffic no longer shares a routing table (that is, the default routing table) with other control traffic or protocol traffic in the system. Traffic in the `mgmt_junos` VRF instance uses private IPv4 and IPv6 routing tables.

We've introduced a new configuration option "routing-instance" at `[edit protocol sflow collector]` hierarchy level to specify the routing instance name.

- Export of sFlow sample packets via non-default VRF WAN ports.

sFlow is a traffic monitoring protocol that supports VRFs. sFlow provides traffic sampling on configured ports based on sample rate and port information to a collector. An sFlow monitoring system consists of an sFlow agent embedded in the device and up to four external collectors. The

sFlow agent performs packet sampling and gathers interface statistics, and then combines the information into UDP datagrams that are sent to the sFlow collectors.

Collectors can be added and per VRF so that collectors can be spread out across different VRFs. The sFlow forwarding port can belong to a non-default VRF, and captured sFlow packets will have correct sample routing next hop information.

With this extended feature, an sFlow collector can be connected to the switch through the management network. The software forwarding infrastructure daemon (SFID) on the switch looks up the next-hop address for the specified collector IP address to determine whether the collector is reachable by way of the management network or data network.

Use the “show sflow collector detail” command to display the additional field “Routing Instance Name” to indicate the VRF name on which collector is reachable and “Routing Instance Id” that is corresponding to that VRF.

[See [collector](#) and [show sflow collector](#).]

- **Per-queue accounting of explicit congestion notification (ECN) packets** (QFX5130, QFX5220, QFX5230, QFX5240, QFX5700)—Starting in Junos OS Evolved Release 23.4R2, counters on ECN-enabled queues increment when the queues experience congestion or receive packets that encountered congestion on another device. You can view these per-queue ECN accounting statistics through the `show interfaces queue` command. For example:

```
user@host# show interfaces queue et-0/0/5 forwarding-class network-control
Physical interface: et-0/0/5, up, Physical link is Up
...
    ECN-CE packets      :                8577686           482043 pps
    ECN-CE bytes        :                1252342156        70378315 bps
```

[See [Understanding CoS Explicit Congestion Notification](#) and [show interfaces queue](#) .]

- **SNMP support for PFC, ECN, and CoS ingress packet drop accounting** (QFX5230-64CD, QFX5240-64OD, and QFX5240-64QD)—Junos OS Evolved Release 23.4R2 introduces SNMP support that helps to account for the packets that are dropped because of ingress port congestion. You can view and export the error counters data for explicit congestion notification (ECN), ingress drops, and priority-based flow control (PFC) using the following commands:
  - `show snmp mib walk ifJnxTable`
  - `show snmp mib walk jnxCosPfcPriorityTable`

[See [SNMP MIBs and Traps Supported by Junos OS and Junos OS Evolved](#) and [show snmp mib](#).]

- **Telemetry support for CoS ingress packet drop accounting** (QFX5230-64CD, QFX5240-64OD, and QFX5240-64QD)—Junos OS Evolved Release 23.4R2 supports streaming counters for packets that

are dropped due to ingress port congestion. Use the native sensor `/junos/system/linecard/interface/traffic` to stream counters for priority flow control (PFC), explicit congestion notification (ECN), and ingress drops.

Use the native sensor `/junos/system/linecard/qmon-sw/` to stream the priority group (PG) buffer utilization. You can also stream counters for PFC, ECN, and ingress drops by means of OpenConfig using the sensor `/interfaces/interface/`.

Counters for priority flow control (PFC), explicit congestion notification (ECN), and ingress drops are exported using the sensor `/junos/system/linecard/interface/traffic`.

Counters for PFC, ECN, and ingress drops are also exported using OpenConfig sensor `/interfaces/interface/`. Priority group (PG) buffer utilization is exported using the sensor `/junos/system/linecard/qmon-sw/`.

[See [Guidelines for gRPC and gNMI Sensors \(Junos Telemetry Interface\)](#).]

- **Remote port mirroring to IPv4/IPv6 address (GRE encapsulation) with DSCP, source-address, and rate-limiting parameters (QFX5230-64CD, QFX5240-64OD, and QFX5240-64QD)**—Starting in Junos OS Evolved Release 23.4R2, you can configure DSCP, source-address, and rate-limiting parameters in your configuration for remote port mirroring to IPv4 or IPv6 addresses. You use remote port mirroring to copy packets entering a port or VLAN and send the copies to the IPv4 or IPv6 address of a device running an analyzer application on a remote network (sometimes referred to as “extended remote port mirroring”). The mirrored packets are GRE-encapsulated.

You configure `source-address` or `source-ipv6-address`, `dscp`, and `forwarding-class` options—either in the analyzer configuration or the port-mirroring configuration—under these hierarchies, respectively:

- [edit forwarding-options analyzer instance *instance-name* output]
- [edit forwarding-options port-mirroring instance *instance-name* family inet|inet6 output]

You configure the forwarding class and the shaping-rate option under the `class-of-service` hierarchy, as follows:

- set class-of-service forwarding-classes class *class-name* queue-num *queue-number*
- set class-of-service interfaces *interface-name* scheduler-map *map-name*
- set class-of-service scheduler-maps *map-name* forwarding-class *class-name* scheduler *scheduler-name*
- set class-of-service schedulers *scheduler-name* shaping-rate *rate*

[See [Port Mirroring and Analyzers](#).]

- **Strip and replace BGP private-AS path (QFX5230-64CD, QFX5240-64OD, QFX5240-64QD)**—Starting in Junos OS Evolved Release 23.4R2, we have introduced the `strip-as-path` policy option that removes the incoming autonomous system (AS) path as part of the import policy for a BGP session

and replaces the received autonomous system (AS) path with the receiving router's local AS number for the receiving session. Note that the local AS number may be different from the number configured under autonomous system in the [edit routing-options] hierarchy.

If you need to normalize externally injected routes, you can use this policy option for the incoming autonomous system (AS) path so that it may be used similarly to routes that originate solely within the fabric. The new strip-as-path policy option has no impact on the BGP export policy.

You can configure the strip-as-path option under policy-options then clause:

```
set policy-options policy-statement do-strip term a then strip-as-path
```

[See [Autonomous Systems for BGP Sessions](#).]

## Additional Features

We've extended support for the following features to these platforms.

- **EVPN VXLAN L2 GW, ARP suppression** (QFX5230-64CD)

[See [Understanding EVPN with VXLAN Data Plane Encapsulation](#) and [EVPN Proxy ARP and ARP Suppression, and Proxy NDP and NDP Suppression](#).]

- **HTTP and TCP probe types for RPM** (QFX5130-32CD, QFX5130-48C, QFX5220, and QFX5230-64CD). You can now configure the http-get, http-metadata-get, and tcp-ping probe types for real-time performance monitoring (RPM) probes. You must configure the offload-type none statement to be able to commit the configuration.

[See [probe-server](#), [probe-type](#), and [rpm](#).]

- **Inband Flow Analyzer (IFA) 2.0 transit node support** (QFX5240-64OD and QFX5240-64QD)

[See [Inband Flow Analyzer \(IFA\) 2.0 Probe for Real-Time Flow Monitoring](#).]

- **Wake-On-Lan Targeted Broadcast support for EVPN-VXLAN** (QFX5130-32CD, QFX5130E-32CD, QFX5130-48C, and QFX5700)

[See [Targeted Broadcast](#) and [targeted-broadcast](#).]

- **Supported transceivers, optical interfaces, and DAC cables** Select your product in the Hardware Compatibility Tool (<https://apps.juniper.net/hct/product/>) to view supported transceivers, optical interfaces, and direct attach copper (DAC) cables for your platform or interface module. We update the HCT and provide the first supported release information when the optic becomes available.

- [Software Installation and Upgrade | 139](#)
- [VPNs | 139](#)

Learn about changes in behavior and syntax in this release for QFX Series switches

## EVPN

- **Change in options and generated configuration for the EZ-LAG configuration IRB subnet-address statement**—With the EZ-LAG `subnet-address inet` or `subnet-address inet6` or

at the `[edit services evpn evpn-vxlan irb irb-instance]` hierarchy, you can now specify multiple IRB subnet addresses in a single statement using the list syntax `addr1 addr2 ?`. Also, in the generated configuration for IRB interfaces, the commit script now includes default `router-advertisement` statements at the `edit protocols hierarchy level` for that IRB interface.

[See [subnet-address \(Easy EVPN LAG Configuration\)](#).]

- **Updates to syslog EVPN\_DUPLICATE\_MAC messages**—EVPN\_DUPLICATE\_MAC messages in the System log (syslog) now contain additional information to help identify the location of a duplicate MAC address in an EVPN network. These messages will include the following in addition to the duplicate MAC address:
  - The peer device, if the duplicate MAC address is from a remote VXLAN tunnel endpoint (VTEP).
  - The VLAN or virtual network identifier (VNI) value.
  - The source interface name for the corresponding local interface or multihoming Ethernet segment identifier (ESI).

For example: Feb 27 22:55:13 DEVICE\_VTEP1\_RE rpd 39839: EVPN\_DUPLICATE\_MAC: MAC address move detected for 00:01:02:03:04:03 within instance=evpn-vxlan on VNI=100 from 10.255.1.4 to ge-0/0/1.0.

For more on supported syslog messages, see [System Log Explorer](#).

## Infrastructure

- **Option to disable path MTU discovery**—Path MTU discovery is enabled by default. To disable it for IPv4 traffic, you can configure the `no-path-mtu-discovery` statement at the edit `system internet-options` hierarchy level. To reenable it, use the `path-mtu-discovery` statement.

[See [Path MTU Discovery](#).]

## Junos OS API and Scripting

- **<get-trace> RPC support removed (ACX Series, PTX Series, and QFX Series)**—The `show trace application app-name` operational command and equivalent `<get-trace>` RPC both emit raw trace data. Because the `<get-trace>` RPC does not emit XML data, we've removed support for the `<get-trace>` RPC for XML clients.
- **XML output tags changed for `request-commit-server-pause` and `request-commit-server-start` (QFX Series)**—We've changed the XML output for the `request system commit server pause` command (`request-commit-server-pause` RPC) and the `request system commit server start` command (`request-commit-server-start` RPC). The root element is `<commit-server-operation>` instead of `<commit-server-information>`, and the `<output>` tag is renamed to `<message>`.

## Network Management and Monitoring

- **NETCONF `<copy-config>` operations support a `file://` URI for copy to file operations (QFX Series)**—The NETCONF `<copy-config>` operation supports using a `file://` URI when `<url>` is the target and specifies the absolute path of a local file.

[See [<copy-config>](#).]

- **Device family identifier changed for native YANG modules (QFX Series)**—Starting in Junos OS Evolved Release 23.4R2, native YANG modules for QFX Series devices by default use the `junos` device family identifier instead of the `junos-qfx` identifier in the module's name, namespace, and filename.

With this change, all devices running Junos OS Evolved use the `junos` device family identifier. To emit device-specific modules that use the `junos-qfx` device family identifier, configure the device-specific and `emit-family-ns-and-module-name` statements at the `[edit system services netconf yang-modules]` hierarchy level.

[See [Understanding Junos YANG Modules](#).]

## Routing Protocols

- **Optimized mesh group routes (QFX5110, QFX5120, QFX5130, QFX5700 and ACX Series)**— `show route snooping for inet.1/inet6.1 table` and `show route snooping table inet.1/inet6.1` displays only CE mesh group routes for platforms that support EVPN-MPLS or EVPN-VxLAN multicast. In earlier releases, other mesh groups like the VE mesh group were also displayed.

## System Management

- **Additional Upgrade fields for the `show system applications detail` command (ACX Series, PTX Series, and QFX Series)**—The `show system applications detail` command and corresponding RPC include additional Upgrade output fields. The fields provide information about notifications and actions related to various upgrade activities.

[See [show system applications \(Junos OS Evolved\)](#).]

## Software Installation and Upgrade

- **configuration and no-configuration options for the `request system snapshot` command (QFX Series)**—When you omit or include the configuration option, the `request system snapshot` command copies the `/config` directory and the configuration stored for each installed software version to the alternate solid-state drive (SSD) as part of the snapshot. You can use the `no-configuration` option to exclude the `/config` directory and the configuration stored for each installed software version from the snapshot.

## VPNs

- **Increase in revert-delay timer range**— The `revert-delay` timer range is increased to 600 seconds from 20 seconds.

[See [min-rate](#).]

- **Configure min-rate for IPMSI traffic explicitly**— In a source-based MoFRR scenario, you can set a min-rate threshold for IPMSI traffic explicitly by configuring `ipmsi-min-rate` under `set routing-instances protocols mvpn hot-root-standby min-rate`. If not configured, the existing min-rate will be applicable to both IPMSI and SPMSI traffic.

[See [min-rate](#).]

## Known Limitations

### IN THIS SECTION

- [General Routing | 140](#)

Learn about limitations in this release for QFX Series switches.

For the most complete and latest information about known Junos OS Evolved defects, use the Juniper Networks online [Junos Problem Report Search](#) application.

## General Routing

- IPv4 packets dropped due to egress MTU mismatch are not shown in the `show interfaces extensive` output in the CLI. To get these dropped packet statistics, the debug commands from the forwarding process must be used. [PR1768752](#)
- On QFX5240-64OD/64QD platform, the error statistics on the management port `re0:mgmt-0` does not reflect the errors experienced including link flaps, FCS errors etc. [PR1791886](#)
- On QFX5240 and QFX5230 platforms with Junos OS Evolved 23.4R2, when PFC watchdog feature configured with recovery action of **drop** and if PFC storm continuously detected and recovered, CRC error counter could increase with small number under `show interface extensive interface` output. These CRC errors could occur only for larger frames (`mtu>1024`) received at high rate. Packet drops are seen on the interface due to PFC watchdog action of **drop**, which is expected. CRC errors are not seen with PFC watchdog recovery action of **forward**. [PR1807420](#)

- On QFX5700E, **pci 0000:xx:xx.x BAR xx: failed to assign** messages are seen during boot in the logs. These messages have no impact to functionality. [PR1807706](#)
- Storm control does not work on multicast packets on QFX5130, QFX5700 platform if broadcast packets are excluded from the storm control profile. To support IGMP, MLD snooping functionality, we've added flood in vlan rules in ASIC pipeline which causes mcast packets to be flooded as broadcast packets due to BCM TD4 ASIC limitation. [PR1813514](#)

## Open Issues

### IN THIS SECTION

- [General Routing | 141](#)
- [Interfaces and Chassis | 144](#)

Learn about open issues in this release for QFX Series switches.

For the most complete and latest information about known Junos OS Evolved defects, use the Juniper Networks online [Junos Problem Report Search](#) application.

## General Routing

- On QFX5230-64CD platform, 400G DAC cable of 2.5m length and 4X100G DAC BO might not link up with some peer devices. This issue is not seen with all peer devices. If this happens, please replace the 2.5m cable with a 1m DAC cable or use supported 400G Optics instead. [PR1747315](#)
- On QFX5130-48C, when image upgrade is done using CLI, the log messages will have kernel trace reported. There is no functionality impact due to the messages. [PR1755406](#)
- QFX5230-64CD: **FPC 0 idtRC38612 PLL LOCK Failure** major alarm is seen after the system comes up post a device reboot. This alarm is cleared after a few minutes once the system reaches steady state. No user action is required. [PR1766984](#)
- Whenever a QFX5130-48C device is reset using rear panel reset button by pressing the button for short or long duration, the port LEDs on ports 56/57 might glow in amber for a few seconds during boot up. The port LEDs amber status turn off and reflect correct port state once device is up. [PR1792619](#)

- The recommended procedure for FPC card removal is to do a graceful OIR by following the documented steps. However, if the FPC card is ungracefully jacked out or plugged in several times in a short interval, the software might show the FPC status as "FAULT". Following are the steps to recover from the fault state: [PR1799333](#)
  1. Jack out the FPC.
  2. Wait for 1 minute for FPC state to become **Fault** in `show chassis fpc pic-status` command.
  3. Jack In FPC.
  4. Wait for 1 minute for FPC state shows as present in `show chassis fpc pic-status` command.
  5. Run CLI command `request chassis fpc online slot` to bring FPC in online state.
  6. Wait for 3 minutes for all interfaces to come up.
- QFX5130E-32CD supports class A performance with default FEC applicable for the particular interface. [PR1800144](#)
- On a QFX5700 chassis with QFX5700E-FEB, during FEB offline or online operation, a power fault message is reported on the console. Following is an example of the message printed on to the console. **pcieport 0000:41:09:0: pciehp: Slot(9): Power fault.** [PR1802959](#)
- When a VXLAN encapsulated IP packet, or an IP packet with UDP port matching the VXLAN UDP port, is received on a vlan-tagging enabled interface, the switch drops the frame. This issue is not seen if the incoming port is an untagged interface, or if the interface is actually doing VXLAN encaps/decap operations. In such cases, the device forwards the frame correctly. [PR1805922](#)
- When the QFX5700 is power cycled, in some cases, during the reboot of the system, the `evoaft-jvisiond-brcm` process might not start automatically. The operating system stops the service and generates a major alarm. This does not impact other forwarding or chassis functionality. Restarting the process through the CLI login shell clears the alarm and the process functionality is restored. [PR1807624](#)
- IPv4/IPv6 reserved multicast and L2 multicast traffic received over VXLAN access port is flooded out of all ports of the VXLAN except vtep. [PR1811158](#)
- On the QFX5220, QFX5130, QFX5700, QFX5230, or QFX5240 platforms, after clearing queue counters for the aggregated Ethernet interface from CLI, if one of the aggregated Ethernet member interfaces is immediately removed from aggregated Ethernet bundle, it displays invalid queue counters for the aggregated Ethernet interface. Clearing the queue counters from CLI again helps to resolve the issue. [PR1811575](#)
- No support for Layer 3 vlan-tagged sub-interfaces on VXLAN NNI side in Junos OS Evolved 23.4R2 on QFX5230. Only layer 3 interfaces or IRB can be configured on VXLAN NNI side. [PR1813069](#)

- When a QFX5700E chassis is powered off, there might be CPU kernel trace messages printed onto the console during power off. These messages have no impact to functionality.[PR1813256](#)
- QFX130E-32CD: Sometimes system fails to boot up during power cycle when there is insufficient time gap between power-off and power-on. The recommendation is to give a 120 seconds gap between power-off and power-on. [PR1813294](#)
- QFX5230-64CD, QFX5130-48C, : Help string for MTU settings on management interface are not correct. The range is showed as 256-9408 instead of 256-9216.[PR1813591](#)
- In rare cases, **FPC 0 Volt Sensor Fail" or "FPC 0 Voltage Threshold Crossed** alarm is seen after bootup on QFX5130-48C or QFX5130-48CM. [PR1816064](#)
- QFX5700 MacSec: Minor packet drops (< 0.0000001%) observed when MacSec is enabled. [PR1816407](#)
- USB disks with Junos OS Evolved images from Junos OS Evolved 23.4R2 onwards might not be detectable by Windows. They still have valid images, and can be used for Junos OS Evolved installs. The only issue is that new images cannot be installed on these USB disks because Windows no longer recognizes these USB drives. [PR1819846](#)
- On QFX5220, QFX5230, QFX5240, QFX5130, or QFX5700 platforms, for lossless queues packet admission control is based on ingress priority group thresholds only. Once lossless packet is accepted by ingress, there is no any further admission control checks based on egress queue thresholds. So dynamic threshold (alpha) setting configured at egress queue level, does not make any impact for lossless queues. For lossless queue, peak shared buffer utilisation is always based on the ingress priority group dynamic threshold. Do not configure per queue alpha through **buffer-dynamic-threshold** for lossless queues. On QFX5220, QFX5230, QFX5240, QFX5130, or QFX5700 platforms, ECN threshold is static. However PFC thresholds are dynamic. For effective DCQCN behaviour, make sure ECN threshold is always lower than the PFC XOFF threshold. Specifically when multiple ingress and egress ports involved in lossless queue congestion, there is high chance for PFC XOFF threshold hitting before ECN threshold. Proper ECN marking thresholds can be arrived by monitoring the peak buffer utilisation of congested lossless queues and fine tuning the ECN thresholds accordingly. [PR1820266](#)
- QFX5130-48CM: MacSec: Packet drops are seen when MKA session switches from primary to fallback In case the primary pre-shared-key (PSK) fails to establish a connection, the fallback PSK is used. Traffic loss is observed during switch from primary to the fallback session. No traffic drop is observed if the primary PSK is kept active without switching to the fallback PSK. Thus, as long as the primary PSK is active, the MACSec sessions pass traffic properly without any drop. [PR1820549](#)

## Interfaces and Chassis

- Unified ISSU from Junos OS Evolved 23.2R2 to newer releases generates core files. Object data structure is extended for a fix and during the extension, the extensions between the releases should match. However, there is a mismatch with respect to such extensions between the releases, which causes the issue. [PR1803068](#)

## Resolved Issues

### IN THIS SECTION

- [General Routing | 144](#)
- [Interfaces and Chassis | 145](#)

Learn about the issues fixed in this release for QFX Series switches.

For the most complete and latest information about known Junos OS Evolved defects, use the Juniper Networks online [Junos Problem Report Search](#) application.

## General Routing

- The `show interfaces extensive | no-more` command takes a longer time to display the output. [PR1773428](#)
- On Junos OS Evolved platform, SNMP walk fails to display SNMP object values on channelized interface. [PR1790394](#)
- QFX5230-64CD, QFX5240-64OD, QFX5240-64QD: USB stick continues to show up under `show chassis hardware detail` even after unplugging from the device. [PR1793934](#)
- IPv6 traffic statistics shows large or invalid values at times when route-accounting is deactivated and activated. [PR1798636](#)
- Network reachability issues, that is traffic drops when MAC moves from VGA mac and Remote IRB MAC to access interface. [PR1805685](#)

- Due to clocking issue in the external PHY, traffic drops are observed having MACsec enabled. [PR1806957](#)

## Interfaces and Chassis

- On Junos OS Evolved QFX5700 platforms, the vmcore might be seen if any component is forcefully removed from the PCI (Peripheral Component Interconnect) bus. [PR1739142](#)
- The `monitor` interface or `show` interface does not display the interface description. [PR1762065](#)

# Upgrade Your Junos OS Evolved Software

Products impacted: ACX7024, ACX7024X, ACX7100-32C, ACX7100-48L, ACX7332, ACX7348, ACX7509, PTX10001-36MR, PTX10003, PTX10004, PTX10008, PTX10016, PTX10002-36QDD, QFX5130-32CD, QFX5130-48C, QFX5130E-32CD, QFX5220, QFX5230-64CD, QFX5240, QFX5700, QFX5700E-FEB switches.

Follow these steps to upgrade your Junos OS Evolved software:

1. Using a Web browser, navigate to the All Junos Platforms software download URL on the Juniper Networks webpage: <https://www.juniper.net/support/downloads/>
2. In the Find a Product box, enter the Junos OS platform for the software that you want to download.
3. Select Junos OS Evolved from the OS drop-down list.
4. Select the relevant release number from the Version drop-down list.
5. In the **Install Package** section, select the software package for the release.
6. Log in to the Juniper Networks authentication system using the username (generally your e-mail address) and password supplied by a Juniper Networks representative.
7. Review and accept the End User License Agreement.
8. Download the software to a local host.
9. Copy the software to the device or to your internal software distribution site.
10. Install the new package on the device.

**NOTE:** We recommend that you upgrade all software packages out of band using the console because in-band connections are lost during the upgrade process.

## Upgrade and Downgrade Support Policy for Junos OS Evolved Releases

We have two types of releases, Standard EOL and EEOL:

- End of Life (EOL) releases have engineering support for twenty four months after the first general availability date and customer support for an additional six more months.
- Extended End of Life (EEOL) releases have engineering support for thirty six months after the first general availability date and customer support for an additional six more months.

For both Standard EOL and EEOL releases, you can upgrade to the next three subsequent releases or downgrade to the previous three releases. For example, you can upgrade from 21.4 to the next three releases – 22.1, 22.2 and 22.3 or downgrade to the previous three releases – 21.3, 21.2 and 21.1.

For EEOL releases only, you have an additional option - you can upgrade directly from one EEOL release to the next two subsequent EEOL releases, even if the target release is beyond the next three releases. Likewise, you can downgrade directly from one EEOL release to the previous two EEOL releases, even if the target release is beyond the previous three releases. For example, 21.4 is an EEOL release. Hence, you can upgrade from 21.4 to the next two EEOL releases – 22.2 and 22.4 or downgrade to the previous two EEOL releases – 21.2 and 20.4.

**Table 6: EOL and EEOL Releases**

Release Type	End of Engineering (EOE)	End of Support (EOS)	Upgrade/ Downgrade to subsequent 3 releases	Upgrade/ Downgrade to subsequent 2 EEOL releases
Standard End of Life (EOL)	24 months	End of Engineering + 6 months	Yes	No
Extended End of Life (EEOL)	36 months	End of Engineering + 6 months	Yes	Yes

For more information about software installation and upgrade, see [Software Installation and Upgrade Overview \(Junos OS Evolved\)](#). For more information about EOL releases and to review a list of EOL releases, see <https://support.juniper.net/support/eol/software/junosevo/>.

# Licensing

In 2020, Juniper Networks introduced a new software licensing model. The Juniper Flex Program comprises a framework, a set of policies, and various tools that help unify and thereby simplify the multiple product-driven licensing and packaging approaches that Juniper Networks has developed over the past several years.

The major components of the framework are:

- A focus on customer segments (enterprise, service provider, and cloud) and use cases for Juniper Networks hardware and software products.
- The introduction of a common three-tiered model (standard, advanced, and premium) for all Juniper Networks software products.
- The introduction of subscription licenses and subscription portability for all Juniper Networks products, including Junos OS and Contrail.

For information about the list of supported products, see [Juniper Flex Program](#).

## Finding More Information

- **Feature Explorer**—Juniper Networks Feature Explorer helps you to explore software feature information to find the right software release and product for your network.

<https://apps.juniper.net/feature-explorer/>

- **PR Search Tool**—Keep track of the latest and additional information about Junos OS open defects and issues resolved.

<https://prsearch.juniper.net/InfoCenter/index?page=prsearch>

- **Hardware Compatibility Tool**—Determine optical interfaces and transceivers supported across all platforms.

<https://apps.juniper.net/hct/home>

**NOTE:** To obtain information about the components that are supported on the devices and the special compatibility guidelines with the release, see the Hardware Guide for the product.

- **Juniper Networks Compliance Advisor**—Review regulatory compliance information about [Common Criteria](#), [FIPS](#), [Homologation](#), [RoHS2](#), and [USGv6](#).

<https://pathfinder.juniper.net/compliance/>

## Requesting Technical Support

### IN THIS SECTION

- [Self-Help Online Tools and Resources](#) | 148
- [Creating a Service Request with JTAC](#) | 149

Technical product support is available through the Juniper Networks Technical Assistance Center (JTAC). If you are a customer with an active Juniper Care or Partner Support Services support contract, or are covered under warranty, and need post-sales technical support, you can access our tools and resources online or open a case with JTAC.

- **JTAC policies**—For a complete understanding of our JTAC procedures and policies, review the JTAC User Guide located at <https://www.juniper.net/us/en/local/pdf/resource-guides/7100059-en.pdf>.
- **Product warranties**—For product warranty information, visit <https://www.juniper.net/support/warranty/>.
- **JTAC hours of operation**—The JTAC centers have resources available 24 hours a day, 7 days a week, 365 days a year.

## Self-Help Online Tools and Resources

For quick and easy problem resolution, Juniper Networks has designed an online self-service portal called the Customer Support Center (CSC) that provides you with the following features:

- Find CSC offerings: <https://www.juniper.net/customers/support/>
- Search for known bugs: <https://prsearch.juniper.net/>
- Find product documentation: <https://www.juniper.net/documentation/>

- Find solutions and answer questions using our Knowledge Base: <https://kb.juniper.net/>
- Download the latest versions of software and review release notes: <https://www.juniper.net/customers/csc/software/>
- Search technical bulletins for relevant hardware and software notifications: <https://kb.juniper.net/InfoCenter/>
- Join and participate in the Juniper Networks Community Forum: <https://www.juniper.net/company/communities/>
- Create a service request online: <https://myjuniper.juniper.net/>

To verify service entitlement by product serial number, use our Serial Number Entitlement (SNE) Tool: <https://entitlementsearch.juniper.net/entitlementsearch/>

## Creating a Service Request with JTAC

You can create a service request with JTAC on the Web or by telephone.

- Visit <https://myjuniper.juniper.net/>
- Call 1-888-314-JTAC (1-888-314-5822 toll-free in the USA, Canada, and Mexico).

For international or direct-dial options in countries without toll-free numbers, see <https://support.juniper.net/support/requesting-support/>.
